It is most true that he did leave the public hall of Hodnet with Mrs and Miss Sommers, and true that he escorted them home. Nay, it is also true that he won so much upon their favour, that, on his requesting permission to wait upon them next day, it was without much difficulty obtained. This was surely very imprudent in Mrs Sommers, and every body said it was very imprudent. "What! admit as a visitor in her family a person whom she had never seen in her life before, and who, for any thing she knew, might be a swindler or a Jew! There was never any thing so preposterous;—a woman, too, of Mrs Sommers's judgment and propriety! It was very—very strange." But whether it was very strange or not, the fact is, that the stranger soon spent most of his time at Violet Cottage; and what is perhaps no less wonderful, notwithstanding his apparent intimacy, he remained nearly as much a stranger to its inmates as ever. His name, they had ascertained, was Burleigh—Frederick Burleigh; that he was probably upwards of eight-and-twenty, and that, if he had ever belonged to any profession, it must have been that of arms. But farther they knew not. Mrs Sommers, however, who to a well cultivated mind added a considerable experience of the world, did not take long to discover that their new friend was, in every sense of the word, a man whose habits and manners entitled him to the name and rank of a gentleman; and she thought, too, that she saw in him, after a short intercourse, many of those nobler qualities which raise the individual to a high and well-merited rank among his species. As for Emily, she loved his society she scarcely knew why; yet, when she endeavoured to discover the cause, she found it no difficult matter to convince herself that there was something about him so infinitely superior to all the men she had ever seen, that she was only obeying the dictates of reason in admiring and esteeming him.

Her admiration and esteem continued to increase in proportion as she became better acquainted with him, and the sentiments seemed to be mutual. He now spent his time almost continually in her society, and it never hung heavy on their hands. The stranger was fond of music, and Emily, besides being mistress of her instrument, possessed naturally a fine voice. Neither did she sing and play unrewarded; Burleigh taught her the most enchanting of all modern languages—the language of Petrarch and Tasso; and being well versed in the use of the pencil, showed her how to give to her landscapes a richer finish and a bolder effect. Then they read together; and as they looked with a smile into each other's countenances, the fascinating pages of fiction seemed to acquire a tenfold interest. These were evenings of calm but deep happiness—long, long to be remembered.

Spring flew rapidly on. March, with her winds and her clouds, passed away; April, with her showers and her sunshine, lingered no longer; and May came smiling up the blue sky, scattering her roses over the green surface of creation. The stranger entered one evening, before sunset, the little garden that surrounded Violet Cottage. Emily saw him from the window, and came out to meet him. She held in her hand an open letter. "It is from my cousin Henry," said she. "His regiment has returned from France, and he is to be with us to-morrow or next day. We shall be so glad to see him! You have often heard us talk of Henry?—he and I were playmates when we were children; and though it is a long time since we parted, I am sure I should know him again among a hundred." "Indeed!" said the stranger, almost starting; "you must have loved him very much, and very constantly too." "O yes! I loved him as a brother." Burleigh breathed more easily. "I am sure you will love him too," Emily added. "Every body whom you love, and who loves you, I also must love, Miss Sommers. But your cousin I shall not at present see. I must leave Hodnet to-morrow." "To-morrow! Leave Hodnet to-morrow!" Emily grew very pale, and leaned for support upon a sun-dial, near which they were standing. "Good heavens! that emotion—can it be possible! Miss Sommers—Emily—is it for me you are thus grieved?" "It is so sudden," said Emily, "so unexpected; are you never to return again—are we never to see you more?" "Do you wish me to return, do you wish to see me again?" "Oh! how can you ask it?" "Emily, I have been known to you under a cloud of mystery—a solitary being, without a friend or acquaintance in the world—an outcast apparently from society—either sinned against or sinning—without fortune, without pretensions;—and with all these disadvantages to contend with, how can I suppose that I am indebted to any thing but your pity for the kindness which you have shown to me?" "Pity! pity you! O Frederick! do not wrong yourself thus. No! though you were a thousand times less worthy than I know you are, I should not pity, I should ——" She stopped confused, a deep blush spread over her face, she burst into tears, and would have sunk to the ground had not her lover caught her in his arms. "Think of me thus," he whispered, "till we meet again, and we may both be happy." "O! I will think of thee thus for ever!" They had reached the door of the cottage. "God bless you, Emily," said the stranger; "I dare not see Mrs Sommers; tell her of my departure, but tell her that ere autumn has faded into winter, I shall again be here. Farewell, dearest, farewell." She felt upon her cheek a hot and hurried kiss; and when she ventured to look round, he was gone.

Henry arrived next day, but there was a gloom upon the spirits of both mother and daughter, which it took some time to dispel. Mrs Sommers felt for Emily more than for herself. She now perceived that her child's future happiness depended more upon the honour of the stranger than she had hitherto been aware, and she trembled to think of the probability, that in the busy world he might soon forget the very existence of such a place as Hodnet, or any of its inhabitants. Emily entertained better hopes, but they were the result probably of the sanguine and unsuspicious temperament of youth. Her cousin, meanwhile, exerted himself to the utmost to render himself agreeable. He was a young, frank, handsome soldier, who had leapt into the very middle of many a lady's heart—red coat, sword, epaulette-belt, cocked hat, feathers, and all. But he was not destined to leap into Emily's. She had inclosed it within too strong a line of circumvallation. After a three months' siege, it was impregnable. So Henry, who really loved his cousin next to his king and country, thinking it folly to endanger his peace and waste his time any longer, called for his horse one morning, shook Emily warmly by the hand, then mounted, "and rode away."

Autumn came; the leaves grew red, brown, yellow, and purple; then dropped from the high branches, and lay rustling in heaps upon the path below. The last roses withered. The last lingering wain conveyed from the fields their golden treasure. The days were bright, clear, calm, and chill; the nights were full of stars and dew, and the dew, ere morning, was changed into silver hoar-frost. The robin hopped across the garden walks, and candles were set upon the table before the tea-urn. But the stranger came not. Darker days and longer nights succeeded. Winter burst upon the earth. Storms went careering through the firmament; the forests were stripped of their foliage, and the fields had lost their verdure. But still the stranger came not. Then the lustre of Emily's eye grew dim; but yet she smiled, and looked as if she would have made herself believe that there was hope.

And so there was; for the mail once more stopped at the Blue Boar; a gentleman wrapped in a travelling cloak once more came out of it; and Mr Gilbert Cherryripe once more poked the fire for him in his best parlour. Burleigh did come back.

I shall not describe their meeting, nor inquire whether Emily's eye was long without its lustre. But there was still another trial to be made. Would she marry him? "My family," said he, "is respectable, and as it is not wealth we seek, I have an independence, at least equal I should hope to our wishes; but any thing else which you may think mysterious about me I cannot unravel until you are indissolubly mine." It was a point of no slight difficulty; Emily entrusted its decision entirely to her mother. Her mother saw that the stranger was inflexible in his purpose, and she saw also that her child's happiness was inextricably linked with him. What could she do? It had been better perhaps they had never known him; but knowing him, and thinking of him as they did, there was but one alternative—the risk must be run.

It was run. They were married in Hodnet; and immediately after the ceremony they stepped into a carriage, and drove away, nobody knew whither. We must not infringe upon the sacred happiness of such a ride, upon such an occasion, by allowing our profane thoughts to dwell upon it. It is enough for us to mention, that towards twilight they came in sight of a magnificent Gothic mansion, situated in the midst of extensive and noble parks. Emily expressed her admiration of its appearance; and her young husband, gazing on her with impassioned delight, exclaimed, "Emily, it is thine! My mind was imbued with erroneous impressions of women; I had been courted and deceived by them. I believed that their affections were to be won only by flattering their vanity, or dazzling their ambition. I was resolved, that unless I were loved for myself, I should never be loved at all. I travelled through the country *incognito;* I came to Hodnet, and saw you. I have tried you in every way, and found you true. It was I, and not my fortune, that you married; but both are thine. We are now stopping at Burleigh House; your husband is Frederick Augustus Burleigh,* Earl of Exeter, and you, my Emily, are his Countess!"

* The author appears to have here forgotten that the family name of the Earl of Exeter is Cecil—Burleigh being the former and certainly most honoured title of the house.—Ed.

[We would consider ourselves as abusing the trust reposed in our work, as a medium of innocent amusement and moral instruction, if we failed to point out to our young readers of the gentler sex the extreme danger of the conduct attributed to Emily Sommers in this clever tale. Such conduct might in her instance be crowned with happiness and grandeur; but it was highly blameable in principle, and might have been attended with the most opposite consequences—nay, it is probable that for one instance of such conduct leading to happiness, there are ninety-nine where it must be attended with the utter wreck of the individual guilty of it. In such a state of society as ours, there can be no safe principle, except that every man aiming at our acquaintance must be introduced to us by some person we already know, who becomes a guarantee, as it were, for the propriety of his behaviour and the honour of his views. Without this, we never can be sure that the individual addressing us is not a designing adventurer, who would think nothing of making our happiness his sport, or who aims at his own aggrandisement, by the disgraceful means of inveigling a woman above his own rank into matrimony. Many good-natured people habitually neglect this rule, and we have known numerous instances of such neglect being followed by the most disastrous events. Some years ago, a lady permitted one of her daughters to form an acquaintance with an individual who seemed to lead the life of a gentleman in Edinburgh. His apparent rank was greater than that of the young lady; and it was accordingly looked upon as a *grand match* when she secured him as a husband. Lamentable delusion! The man turned out in a few months to be a common swindler! He was arrested and committed to jail; and it was not till his death some years after, nor till he had overwhelmed his wife and her connections with shame and vexation unutterable, that she was relieved from him. There were even circumstances in this case more painful than these, but delicacy forbids our adverting to them. We recollect two other cases, at this moment, in which young ladies of the greatest merit, and who might have confidently looked forward to a long life of honour and comfort as the wives of respectable men, were lost—utterly destroyed—by their imprudence in marrying a man to whom they were not introduced. No doubt, if we were to tax our memories, we could recollect many more; but every reader of the least experience in the world will recollect his own instances, and we need not therefore seek to extend the catalogue. We content ourselves with pronouncing emphatically, that, for a young lady to admit the addresses of an unknown youth, however fascinating his manners, or noble his air, is just wilfully to rush upon the almost certain chance of utter misery for life.]

PEEPS FROM A WINDOW.

When I was a student at the College of Edinburgh, I occupied an apartment in the southern division of the city, where many individuals in the same circumstances with myself, and many families in the lower walks of life, are accustomed to reside. My accommodations were humble, but they were suited to my fortune; and, with the world opening and brightening before me, I did not then much regard the want of those comforts which are afterwards found so necessary. Nor was the place without some real charms. From my window I commanded a view of one of the most august natural scenes any where to be met with—the rocky front of Salisbury Crags, at the bottom of which reposed a deserted palace, the seat of the most endeared historical recollections, and beside which I have often walked for hours with inexpressible pleasure, as if to be merely beneath the walls of Holyrood were the enjoyment of a romance. Then, on the fair spring evenings, when I could sit with my window open, it was delightful to hear the troops of little girls playing at their metrical games in some of the neighbouring courts, sent out by the first burst of the fair weather, like so many ephemera, to enjoy a brief sport in what is always so precious a thing in the midst of a large city, the open air, and causing the lofty walls around them to resound with their sweet voices, as they lilted up "Janet Jo," or the Merry-matanzie, or "We are three brethren come from Spain," which last I have always deemed to be the final puerilised form of some antique *lai*, that once was sung in hall before the noble and the fair.*

* The reader, we make almost sure, will be pleased with the verses of this operatic game, which we will here write down from recollection. In the first place, one range of girls take their station at a wall, while another, twining their arms together behind their backs, commence moving backwards and forwards to the measure of the music, as they sing:

We are three brethren come from Spain,
All in French garlands;
We are come to court your daughter Jean,
And adieu to you, my darlings.

This is sung to a very pretty air in advancing, and, at the conclusion, the little row retreat at the same measured pace, while the wall-stationed party sing:

In the course of one particular winter, I found a strange and hardly proper source of amusement for occasional leisure minutes, in inspecting the proceedings of a family, whose windows, owing to an angularity in two streets, approached near to mine, and whose rooms I could survey from my own somewhat elevated situation, without their being able to see mine, or likely to observe what I was about. Had the case been an ordinary one, I do not think I would have spent a minute on such a business as this; but there was something in the family which, little as I saw of it, very speedily interested me. The man seemed merely a common artizan—I should not wonder that he belonged to that trade which mankind have so foolishly agreed to laugh at, the tailors; or perhaps he was a shoemaker. No matter. It was evident, from the hours he kept, that he was a man who won weekly wages at some ordinary employment. His wife was a neat, decent-looking woman, apparently from the country; and they had one lovely infant, which even the confined air of the city had not deprived of its radiant cheeks and sunny smiles. It was delightful to observe the honest artizan, whenever he came home, immediately get hold of his darling child, and coax and prattle with it on his knee. His habits seemed all to be of a laudable and even interesting description. It was evident he spent none of his leisure time any where but in the society—and what more fitting?—of his wife and infant. On the outside of his windows, which had a pretty clear exposure to the south, he had boxes containing a small mimic garden, and he was frequently engaged in dressing these little spots and training the flowers, as if, in so doing, he found there was still a link between himself and physical nature. He had also a blackbird, which hung in a cage ou the outside, and in the evenings made all the neighbourhood vocal with "Over the water to Charlie." These things were but trivial fragments of the country, its scenes, and sounds; but they were all, I doubt not, that could be had in the present atate of his circumstances; and, to a mind of any reach of idea, they would always be sufficient to awaken associations of the more extensive ranges of natural objects, to which he had been perhaps acoustomed in other years, and which he looked back to with the ceaseless regret of a city-banished lover of nature. He had also a German flute, which on some evenings he would play at an open window; and I am free to confess that I have rarely since been so truly touched by any music. His favourite tunes were the gentle pastoral melodies of Scotland—Tweedside, Cowdenknowes, the Bush aboon Traquair, and so forth—all of which had no less the charm of association to me than they could have to the performer, for I too was an exile from the scenes which those airs so effectually consecrate in the hearts of all connected with them. What, however, was the most pleasing trait of this evidently amiable and right-spirited man, was, that, at a certain hour, he invariably opened a large Bible on his table, and appeared to give himself and his household up for a time to religious meditation. There was altogether in this man exactly that range of tastes and habits which are sometimes found adorning humble life in the rural districts of Scotland, but which are unfortunately found so much more rarely amidst the huge masses of a city population.* I was so pleased with the man—his modest frugal household, his fondness for his child, his music, his gardening, and his sobriety—that, from an idle and impertinent gazer, I became mentally his zealous friend, and there was nothing in my power I would not have done to testify that friendship.

A deep gloom at length came over my happy picture. My worthy friend, I saw, had become ill. His infant was no more dandled on his knee at the window. His flute was no more heard in the court. The blackbird was taken in, and silenced in some manner. His windows were deeply screened, and I could see no more. For a considerable time this continued, till, getting somewhat anxious, I requested my landlady, decent Mrs Nichol, to make some inquiries among the neighbours respecting my unknown friend. I learned that he had been seized by a lingering and dangerous distemper, which prevented him from working any, and was likely to be attended with great embarrassment in more ways than one. Mrs Nichol amply confirmed the good impression I had taken of the man. He was an active and sober tradesman, and a perfect example in the neighbourhood, though no one could be farther than he from all interference with those around him. By and bye, he became a little better, as it was thought, and began to appear, in the habiliments of a sick chamber, at the window, where I saw him smiling upon the infant which smiled upon his knee, but evidently unable to give it the customary sport. Sometimes he would have the Bible open on the table, and his wife sitting fondly and reveringly at his feet; a group to my feelings the most lovely, the most tender and melancholy—melancholy yet pleasing—that I thought I had ever seen. It was truly astonishing what a poor man could be—how amiable and noble a being!—how near, I might almost say, to the angelic! The grosser elements of life seemed here refined away; and this humble and distressed tradesman shone out in my eyes as something far above even the more elevated classes of his fellow-mortals.

The end of the college session soon after arrived, when I had to return to my native home at a considerable distance in —— shire. I could not leave my lodgings without a feeling of deep anxiety respecting this excellent family, for the life of the sick man was declared to be in great danger, and ere long, I reflected, the virtues of this humble scene may be swept from their place, and be heard of no more. The interest I took in the sick man and his concerns would have been declared by many persons to be a mere freak of fancy; but I would fain hope that it was only the impression which *goodness* is naturally calculated to make upon a heart of the medium correctness of feeling when truly studied and observed.

During the ensuing summer, though deeply engaged with my books, and diverted by other objects and amusements, I cast many a thought of kindness back to the amiable household in Edinburgh, but had no opportunity of learning the fate of its master. It was therefore with a burst of joyful feeling, such as has attended few events in my life, that, in returning in November to my wonted lodgings, and hurrying to take a survey of my tradesman's windows, I saw him sitting, as after dinner, dandling his child with the same glee as before his illness, while his wife was bustling gaily about her domestic duties, and the blackbird at the window was whistling "Over the water to Charlie" as vociferously as ever.

Our daughter Jean she is too young,
All in French garlands;
She cannot bide your flattering tongue,
So adieu to you, my darlings.

The moveable party now again advance, singing:

Be she young, or be she old,
All in French garlands;
It's for a bride she must be sold,
So adieu to you, my darlings.

The mother still refuses her consent—

A bride, a bride she shall not be,
All in French garlands,
Till she go through this world with me,
So adieu to you, my darlings.

There is here a hiatus or gap in our recollection; but, after the reply of the lovers, the maternal party relent in the following romantic terms:

Come back, come back, you courteous knight,
All in French garlands;
Clear up your spurs, and make them bright,
And adieu to you, my darlings.

We are again at a loss for what the lover says; but the stationary row proceed to offer a choice of their daughters, in the following elegant terms:

Smell my lilies, smell my roses,
All in French garlands;
Which of my maidens do ye choose?
And adieu to you, my darlings.

The lover now becomes fastidious in proportion to the concessions of the opposite party, and affects to scruple about the bodily sanity of the young ladies:

Are all your daughters safe and sound?
All in French garlands,
Are all your daughters safe and sound?
And adieu to you, my darlings.

But it would appear he is quite assured by the answer, and marries the daughter Jean accordingly—who has

In every pocket a thousand pound,
All in French garlands;
On every finger a gay gold ring,
And adieu to you, my darlings.

---

* Private worship was formerly an almost universal practice in Scotland, in cities as well as in the country. In the former it is now hardly known, while in the rural districts, where national habits of all kinds, good and bad, are sure to be longest retained, it is rapidly going out of fashion. Every body will recollect the beautiful description of the ceremony in Burns's Cottar's Saturday Night: yet, beautiful as that description is, I question if it possesses a charm superior to a little anecdote, which has been related to me by a lady, respecting the performance of this domestic solemnity in one of the meanest suburbs of this large city. In this lady's younger days, her family used to pay some attentions to a very old and very poor couple, who lived in a back court at Fountainbridge, and whose means of subsistence were of the humblest and most precarious kind. They kept two or three hens, whose eggs, sold in the market, procured for them the only money they ever at any time saw. Then Janet could occasionally make herself useful among her poor neighbours, and from them, as well as from some persons in better condition, with whom she kept up an acquaintance, would occasionally procure small supplies of victuals. For many years towards the close of her life, this poor woman was quite blind; nevertheless, it was curious to see her still continuing to patch her husband's clothes—which, on inquiry, she said she did "by rule o' thoom"—and also to perform little servile offices for the gaining of a livelihood. Every night, old John performed what he called *family worship*, raising, with his thin tremulous voice, a psalm, which even the addition of Janet's shrill treble could hardly render audible in the back-court into which their windows looked. The most touching thing of all was, that, after Janet's death, John still kept up his custom; and, according to our informant, hardly any thing could have been more interesting than to listen for a moment in passing to the solitary devotions of this widowed, helpless, and abject creature, whose thready notes seemed the last expiring sighs of attenuated humanity.

BIOGRAPHIC SKETCHES.

JOHN GALT.

This individual, the author of the Ayrshire Legatees, Lawrie Todd, and a number of other popular works of fiction, has just published, in two volumes octavo, an account of his own life, bringing it down to the present period, when he is confined to bed with paralysis, and hopeless of ever again appearing in an active career. We propose to lay an abridgement of Mr Galt's book before our readers, as we conceive that the life of this ingenious, and in many respects unfortunate gentleman, is one from which several instructive views may be derived.

Mr Galt was born at Irvine, in Ayrshire, May 2, 1779, being apparently the eldest son of a person engaged in mercantile pursuits. He gives the following description of his parents, which might be in some measure repeated by many men of literary celebrity: "My father was one of the best, as he was one of the handsomest of men, with only passable ability, in which, however, probity was predominant. My mother was, however, a very singular person; possessing a masculine strength of character, with great natural humour, and a keen perception of the ridiculous in others. In her prime, as I would call it, she indulged in queer metaphorical expressions, exceedingly forcible and original. In latter life, this grew so much into a habit, that her talk to strangers must have often seemed fantastical. The rich ore of common sense, however, which pervaded her observations, was always remarkable, and frequently extorted an instantaneous assent to her opinions, while they provoked irresistible laughter." He spent his first ten or eleven years at Irvine, and there received the rudiments of his education. Being a sickly boy, he became addicted to study, and he used to take great pleasure in hearing tales of foreign adventure from any one who could relate such to him. In his eleventh year, the family removed to Greenock, where he pursued his studies at the public school, under Mr Colin Lamont, and prosecuted still farther his taste for reading, which was much facilitated by an excellent public library to which he had access. He also manifested a turn for mechanics, which, joined to a taste for music, prompted him to attempt the construction of a small piano-forte or hurdy-gurdy, and likewise an Eolian harp. In these early years he composed some pieces of music, one or two of which became popular. What gives a more striking proof of the early developement of his reflective powers, is, that he conceived the idea of several local improvements of great magnitude and importance, some of which have since taken place.

He formed an intimacy with a young man of taste and talent, Mr James Park, who appears to have been of great service to him. The two youths cultivated the belles lettres together, and mutually criticised each other's productions. It does not appear that Mr Galt distinguished himself at school: he was thought, even by his mother, to be a dull and sleepy boy, which was in a great measure owing to the state of his health, which did not become good till he reached manhood. In due time he entered the counting-room of Messrs James Miller and Company, in order to learn the mercantile profession, and here he seems to have continued for several years. A circumstance much to his praise falls to be noticed at this period of his life. His father had intended to leave his mother independent; but, owing to some informality, on the death of the old gentleman it was found that his whole property fell into the hands of his bro-r-at-law, the subject of this memoir. Mr Galt instantly executed a deed, fulfilling the intentions of his father.

In 1801 or 2, a newspaper was started at Greenock, and became a ready and appropriate vehicle for the compositions of Mr Galt and his friend Park. Soon after they began to contribute to more distant miscellanies, such as the Scots Magazine. Mr Galt mentions

that the newspaper was conducted by an individual so singularly stupid, as to be quite a problem. Mr Galt got an early copy of Campbell's beautiful ode "Hohenlinden," and presented it for insertion in the Greenock Advertiser: it was returned, as not worthy of a place! As he advanced into the full bloom of youth, Mr Galt entirely lost his unenergetic character, and became remarkable for that decision, which, whether for good or evil, has ever since characterised him. About the year 1804, having received an insult from a mercantile correspondent, he took upon him to resent it in a very prompt and stern manner, which seems to have rendered his situation at Greenock too unpleasant to be any longer endured. He accordingly went to London, furnished with a vast number of introductory letters, which procured him many dinners, but nothing else; and for six months he appears to have spent his time in indecision as to his future course of life. He at length began a mercantile career in company with one M'Lauchlan, and for some years prospered considerably. He devoted his extended powers of mind to his profession, and to little else; studied the principles of trade, and wrote treatises on some of the more abstruse parts of them. He read a great deal, and his reading was chiefly of an useful kind. He also studied the world, the ways of men, and the circumstances which affect their fortunes—with what success is shown in the sagacity observable in many of his works.

In the third year of his career in London, Mr Galt was involved by a mercantile correspondent in very serious difficulties, which, notwithstanding that his affairs were otherwise prosperous, involved him in bankruptcy. As he lost no character by this event, he might have gone again into business with good prospects: but it appears that his mind at this time contracted those unsettled habits to which the whole of his alleged misfortunes are to be traced. He was ambitious of a learned profession, and entered at Lincoln's Inn, with a view to the English bar, not reflecting till some time after that he had no connections who could serve him in a legal career. According to himself—"One who conceits himself to be at least equal to his neighbours in energy, is very apt to make a false estimate of the chances of life. He sees that men only get forward by their own talents, and it is not till he has obtained some insight of the world that he discovers, although this be true, yet he is apt to undervalue difficulties by attending too much to that circumstance. At the outset of life there is no profession whatever to which the aid of friends, be the individual's talent what it may, is not essential. If he possess superior ability, he will in time, with the precursor of friendship, make himself distinguished; but if he be only an ordinary person, he will never rise above his first establishment." There may, we think, be too much allowed here for the aid of friendship: the true way, in the most of the ways of life, is to trust only to one's own merits and exertions, and the public appreciation of them. At another place, Mr Galt says—less controvertibly—"It appeared to me that those destined to rise higher in the world had about them something which indicated their superiority. It could not be described, but every thing about them showed us at once that they panted for a higher element; a second class were quite at their ease, and I concluded that they found themselves in their station; but the third were altogether persons whom an inherent awkwardness marked as out of and above their sphere, to which they were destined to sink." There is great penetration in these few lines.

In the year 1809, Mr Galt resolved to make a tour of the Mediterranean, partly for his health, and partly to while away the time till he should be called to the bar. At Gibraltar he encountered Lord Byron and Mr Hobhouse, in whose company he sailed to Sicily, and whose acquaintance he thus formed. In his autobiography, he states all he can respecting his connection with Byron; but as English periodical literature, for ten years and upwards, has been overflowing with the ridiculous vagaries of that extraordinary individual, we have resolved that this little sheet at least shall be free of him—and we therefore hurry over this part of Mr Galt's life. From Sicily, the subject of our memoir proceeded to Malta, and thence to Greece, where, at Tripolizza, he conceived a scheme for forming a mercantile establishment in the Levant, to counteract the Berlin and Milan decrees of Napoleon. The conception was instantaneous, and seemed at first so promising as almost to turn his brain. After touching at Smyrna, he returned to Malta, where he found Messrs Struthers, Kennedy, and Company, apprised by Mr Kirkman Finlay's house in Glasgow, of a plan similar to his, which had been suggested by one of their partners resident at Vienna. He was astonished at the coincidence, but resolved to wait till the house at Malta should correspond with that at Glasgow respecting his scheme. In the meantime, he proceeded to inspect the coasts of the Grecian Archipelago, and to ascertain the safest route to the borders of Hungary. In going through the Pass of Thermopylæ, an armed Albanian came down upon him and his fellow-traveller, demanding money, which being refused, the man snapped a rusty pistol at Mr Galt. The two travellers then rode off in a panic, thinking the assailant a robber, and leaving all their baggage behind. The baggage by and bye came up after them, and they learned, to their great amusement, that the man was only a tollman, demanding about one shilling and ninepence sterling.

After an exploratory expedition to the borders of Hungary, in which he satisfied himself of the practicability of introducing goods into the Continent by this circuitous channel, he returned by Sardinia and Gibraltar to Britain (August 1811), landing first in Ireland. He busied himself for a time in applications to the government, on the subject of his Levant scheme, but found great difficulty in attracting any attention. Meanwhile, he prepared and published a quarto volume descriptive of what he had seen in his travels, being his first avowed work. It was not very favourably received, and has long passed out of notice. He never reaped any good from the project which had occupied his thoughts so much, though it was soon after acted upon to a considerable extent and with advantage to those concerned. Mr Kirkman Finlay proposed to give him a principal share in superintending a mercantile concern established by his house at Gibraltar, and he closed with the offer. At Gibraltar, however, he found himself out of his element: he confesses he never could lay his heart to any business in which the imagination was not engaged. His health became bad, and the concern was ruined by the successes of the Duke of Wellington in Spain. He returned to Britain, where it appears his friends were by no means pleased with his conduct. He was now, at thirty-three years of age, an unconnected adventurer in London. All his exertions in life hitherto appear to have been ineffectual in accumulating for him either money or the confidence of friends. He possessed no regular means of supporting himself, and his health was precarious. Yet this seems to have been the time of all others chosen by our author for encountering the responsibilities of a family. Of the exact date of his marriage (further than that it was a Tuesday), or the name of the lady, we are not informed. For some years after this period, we hear of no exertions made by Mr Galt for his subsistence beyond the composition of a few volumes, none of which, so far as we are aware, were very successful. He published Letters from the Levant in one volume octavo; a Life of Cardinal Wolsey; several minor biographies; and a number of plays; the most of the latter being published in a work styled the Rejected Theatre, which appeared in a series of volumes.

The first decidedly successful appearance which Mr Galt made as an author, was in a series of articles, which appeared in the year 1820, in Blackwood's Magazine, styled "The Ayrshire Legatees." In this work, which eventually formed a separate volume, he showed a power of delineating a certain line of Scotch characters, that struck the public mind, especially in Scotland, very forcibly. Sir Walter Scott had already given some admirable pictures; but he had never come so exactly into the very heart of a real Scotch matron of the middle ranks, as Mr Galt now did. Mr Blackwood, whose judgment of literary productions is generally acknowledged to be excellent, saw that this was a new vein, and he encouraged Mr Galt in prosecuting it. A volume, written earlier, but for some years neglected, was now published, under the title of "The Annals of the Parish." It was intended by the author as a kind of Scottish Vicar of Wakefield; and it certainly possesses much of the household humour and pathos of its admirable model. About this time, the author had come to Scotland, chiefly with a view to the education of his children; and for some years he lived in Eskgrove House, near Musselburgh, a seat of Sir William Rae, then Lord Advocate for Scotland. The propinquity of this residence to Edinburgh was peculiarly convenient, as it enabled him to conduct his publications there with great ease. He now issued in rapid succession The Provost, The Steamboat (each one volume), Sir Andrew Wylie, and the Entail (each three volumes), and the Gathering in the West, which related to the flocking of the west-country people to Edinburgh at the period of the king's visit. In all of these works, the peculiar vein of Scottish character which Mr Galt had hit upon, formed the main attraction, and their merits were upon the whole handsomely acknowledged by the public. It could only be urged by critics of strictly just taste, that there was an unfortunate coarseness in many of Mr Galt's pictures, and a mean style of moral feeling in many of his characters, which could not justly be considered as a fair representation of the people from whom they professed to be derived. Another series, published by Messrs Oliver and Boyd, consisted of Ringan Gilhaize, The Spaewife, and Rothelan. They fell under the denomination of historical romances, and were not generally deemed happy efforts. Upon the whole, any distinctive merit which Mr Galt possesses as an author, may be said to lie exclusively in his power of describing a homely specimen of his countrymen, which he almost always does with truth and effect, though, as intimated, with far too much of the selfish feeling attributed to the character. He generally fails in any higher flight.

From about the year 1824 to 1830, Mr Galt was occupied in the business of acting manager and superintendant of the business of an emigration company in Upper Canada, which required his almost constant residence in that country, and appears to have yielded him a salary of a thousand a-year. A large portion of his book is occupied in the details of his transactions in this capacity, and, according to his own showing, he pushed on the concerns of his employers with a great deal of activity, and no small success. The company, however, did not prosper, and his irritable disposition having afforded them an excuse which might have otherwise been wanting, he was discharged at the last, in what appears to have been a very harsh manner. The consequence was an embarrassment in Mr Galt's affairs, which obliged him once more to become bankrupt. In London he again commenced the business of an author, and produced in quick succession Lawrie Todd (a singularly happy and successful novel), Southennan, Bogle Corbet, Stanley Buxton, and Eben Erskine—all of which were in three volumes each—with the Life of Lord Byron (written for the National Library), the Lives of the Players (2 vols. for the same series), the Member and the Radical, political tales in one volume each.

In the midst of these honourable exertions for the support of his family and the discharge of his debts—for both objects seem to have been in his view, and the latter to a certain extent accomplished—he was, in July 1832, struck with paralysis on one side, which has confined him to his room ever since, and left him, as he mournfully expresses it, "three parts dead." Even in this unhappy state, he has contrived to write, or at least to dictate; and though this autobiography, which has been composed under such circumstances, is certainly not a blameless work, it shows that, however his body be affected, his mind still retains its wonted vigour almost entire.

Throughout his narrative, Mr Galt lets out numerous expressions of complaint against individuals and against the world, and endeavours, upon the whole, to convey the impression that he has been what is called "an ill-used man." It would not be humane, and could be attended with no good to himself, to point out to this unfortunate gentleman how apt he is to have been mistaken in this conclusion. We may, however, state as our deliberate impression, after a perusal of his work, that it was hardly possible for any man who went through any thing like the same course of life that he has done, to end with wealth or with comfort. All his exertions since his thirtieth year appear to have been of a desultory and irregular character. He was occasionally in the way of making much money, but he never could long remain in such a position. His own confession, that he never could apply steadily to any employment which did not engage the imagination, must, we fear, be held as an explanation of all his misfortunes, for it is almost equivalent to a declaration that he never could endure any business of a lucrative kind. If a man deliberately prefers the luxury which he experiences in following out all the freaks of his fancy, to the gains of steady plodding industry, it is mere folly to complain that he has not become rich; he could not reasonably expect both rewards. We must at the same time pronounce, that there is an absurdity in the world having enjoyed so much from the writings of this man, and his yet being in distressed circumstances. The remuneration which an author of Mr Galt's degree of merit derives from his labours, bears no proportion to the enjoyment which the public has had in them; and it appears no more than just, that such an individual should experience the public bounty in some shape or other through the medium of the government. Large sums are annually spent upon persons who have no apparent claim but influential connections, while men of genius, who spend their nights and their days, their blood and strength and soul, in instructing and amusing their species, and whose thoughts are to be a capital for the enjoyment of all future ages, perish in poverty and neglect.

We cannot permit this book to pass from our observation without remarking with regret its extraordinary deficiency in dates. We do not recollect having observed in Mr Galt's text more than two dates—that of his birth, and that of his first attack from paralysis. All the rest is a chaos, where the reader can only occasionally make out the period of an incident from the date of a letter occurring thereabouts, or some other such contingent hint. The consequence is, that Mr Galt's youth and middle age—all the facts of his life, in short—are completely jumbled, and lose a great deal of their character. In the above sketch, the reader would be equally at a loss, if we had not been able, from our own knowledge, to supply two or three of the more essential dates. Some people have a habitual contempt for dates, as if they were only of use to persons of a formal and artificial cast of mind. But how events can be *arranged* in the mind of any one by other means, how they can otherwise be intelligible, is more than we can comprehend. In reality, a mind that is distinct about events, or attaches any value to them, must retain the date also, for the mere purpose of showing the relation of those events to others; and no person can pretend to know any thing of either history or biography, who is not also somewhat skilled in chronology. To our mind, an event without a date is the most meaningless thing in the world; and any book which professes to deal in the one without attending to the other, we look upon as little better than a common fiction.

SMOKING AND SNUFF-TAKING.

Among the various follies which we have thought it necessary to hold up to general ridicule and reproach, are the smoking of tobacco and snuff-taking, two pretended luxuries, if not supposed to be necessaries of life, of the most vicious nature, as regards both their expensiveness and their effects on the constitution It is astonishing to see the silliness of mankind—we

would say of many really intelligent people—in beginning an indulgence in these intemperate habits, and continuing in them till they had injured their personal appearance, and hurt their digestive organs. We have usually remarked that young men take to tobacco and snuff more from an idea of doing what they imagine to be manful, than of increasing their comforts. Smoking has an air of listless independence about it that shows well off; and there is doubtless a deal of agreeable fiddle-faddle in the opening, and shutting, and handing about of a neat snuff-box. When conversation lags for want of intellect or invention, snuffing fills up the intervening pauses, and the mutual exchange of a pinch is supposed to be a cement of friendship fully as binding as the eating of salt together used to be in the early ages of civilization. Many pretend that tobacco and snuff are beneficial—that they are taken medicinally for the health. This is exceedingly amusing. "The observations we frequently hear (says the author of a sensibly written tract on the subject) of their being used on account of headachs and stomach complaints, are mere attempts to justify or apologize for the habit. Nay, so far from contributing to health, they destroy it. And, accordingly, it was lately stated in the newspapers, that an eminent physician in the United States imputed the unhealthy condition of the district where he practised, to the common use of cigars.

It is no less evident that these articles cannot contribute to your happiness. What happiness can arise from creating to yourselves restless, craving, unnatural appetites, which are incessantly demanding gratification? The great art of happiness is not to multiply your appetites, but to have yourselves exempted from them; and there appears a general conviction of the hollow and deceitful nature of the satisfaction which snuff and tobacco confer on their votaries; for it is well known that few ever acquired the habit of using them, without repenting it, supposing even that they were in easy circumstances. Very few indeed, who have contracted the habit, will be found to defend it. They will perhaps allege that there is something peculiar in their cases which renders it advisable, and that there might be danger in dropping it. But they will at the same time allow that it is highly proper to warn others against such habits; and this is granting in the fullest manner their unfortunate tendency, and the folly of contracting them. I have heard a saying of a late eccentric judge in our supreme courts, that if he had a thousand noses, he would give them all snuff. A more severe satire could not be pronounced on the habit. Had this eccentric character considered duly, he would have perceived, that, having a thousand such members to gratify, he would have required several active assistants to quiet his clamorous appetites, and keep them in some measure of good humour.

While these articles confer neither health nor happiness, let us attend to what they cost immense numbers of deluded people throughout the nation. The duties paid on tobacco in Great Britain and Ireland for 1829, were stated to be *two millions eight hundred and fifty-nine thousand pounds*. Add to this the cost of production, the expenses of freight, the profits of the manufacturer, wholesale merchant, and retailer, and the whole will amount to an annual sum, which, in the course of fourscore years, would almost pay off the national debt. And all this is of course paid by the consumer. The proportion of duty for Scotland in 1829 was L.273,000. Suppose L.400,000 paid for the article by the consumers, which is probably too low a calculation, and that there are a thousand parishes, being a few more than the actual number; this gives L.400 as the average for each parish. Such is the annual sum paid for an article of luxury, the using which arises from a mere idle habit, and which cannot be shown to be beneficial in any shape whatever.

I have often been amused at the various reasons assigned for this debasing habit. Sometimes a defluxion was wanted from the nose; snuff, of course, exactly fitted the case. Or there was an obstruction in the upper part of the smelling functionary, which snuff cleverly removed. There was a weakness in the eyes, and snuff strengthened them; they were arid, and lacked moisture; nothing in such a case like snuff. Then headachs, qualms, vertigo, all were found to yield to this potent magician. While snuff guarded the upper regions, I found that tobacco was no less vigilant in watching over the safety of the lower. Here, too, a defluxion was wanted; tobacco brought off all the superfluous moisture that was deluging the stomach. The process of digestion did not go on satisfactorily; tobacco corrected the bad qualities of the saliva and gastric juice, and down went the whole contents careering. The bile was overflowing; now, every person knows that the smoke or juice of tobacco makes the troublesome fellow keep within his banks. The toothach, too, I found, was made to yield without a struggle. Who does not know that the toothach proceeds from small worms that breed in decaying teeth? Tobacco makes these give up the ghost with a vengeance; while at the same time it enamels the grinders with a beautiful black.

There are reasons assigned for the habit of using tobacco, which may require a more serious answer. Some defend it on the ground of tobacco being an important article of commerce, and a source of public revenue. There is an immense capital, and much shipping employed in the trade. Many thousands of eminent merchants are supported and enriched by it. Small dealers in the article abound in every parish. Why should so many have their gains diminished, and the means of their subsistence taken from them? Now, the same argument may be used against the diminution of the trade in spirits. And the question that comes to be resolved is this: whether vice and misery should be encouraged and multiplied through the kingdom, in order to furnish sources of public revenue, and to enrich planters, ship-owners, innkeepers, and shopkeepers? It would be no great consolation to the poor inhabitants of any district, to tell them, that, by expending their money on spirits, snuff, and tobacco, instead of employing it in purchasing food and clothing, they are upholding the revenue and commerce of the country, and enriching planters, distillers, and others. If the capital of a country cannot be profitably employed in these articles, it will find its way into other channels.

As an argument for the use of tobacco, I have heard it alleged, that if the lower classes should leave off these habits, they might adopt some equally bad, or worse. Now, I am utterly at a loss to perceive how this will follow in the least. Tobacco and snuff have not been used in this kingdom above 250 years. What bad habits were our ancestors addicted to in place of this, antecedently to that period? Suppose a parish to contain a thousand inhabitants, and that one hundred use snuff and tobacco—What bad habit are the other nine hundred addicted to, from which this one hundred are free?

I have all along characterised the habit of using snuff and tobacco as degrading and debasing. There are few who have not observed the debasing effects proceeding from the use of these articles among the lower ranks. Women who smoke have usually a disgusting appearance, from their want of attention to cleanliness. And so commonly does this take place, that, as soon as one of the younger generation commences the practice, she straightway becomes a slattern, and grows regardless about her looks."

In short, concludes this writer, "with respect to such as have acquired the habit, it surely deserves their consideration, whether it may not be worth while, by submitting to some self-denial, and some uneasy feelings, for a month or two, to obtain freedom from a vile debasing slavery during the rest of their lives."

THE COCOA-NUT TREE.

THE cocoa or palm tree is one of the most valuable natural products of eastern countries, and is so useful in various ways, that, if extirpated, the warm regions of Hindoostan, and adjacent Indian islands, would barely be habitable by human beings. The cocoa, or cocoa-nut tree, to the extent of five varieties, is indigenous to the island of Ceylon; but it is seldom if ever found to that number of varieties in the same plantation, except in the vicinity of a Budhoo temple of some importance. The first variety is the king cocoa-nut, which is of a bright orange colour, and it is usually presented as a compliment by the priests to respectable Europeans, whose curiosity may have induced a visit to the shrine of Budhoo. The next in beauty is also of a bright orange colour, but of a more spherical shape; and the third is of a pale yellow, and rather heart-shaped. The fourth is the common cocoa-nut, of which many millions are annually exported to Europe. The fifth is of a dwarf size, not larger than a turkey's egg.

Cocoa-nuts are planted when ripe, and appear above the ground in three months; in about four years the trees have attained their height, and put forth blossoms. In twelve months after this, the trees bear fruit, which they continue to do for sixty years, when the property of bearing gradually ceases. The number of nuts in a bunch or cluster seldom exceeds from fifteen to twenty good nuts; and in favourable sandy situations the tree will admit of the fruit being gathered four or five times in the course of a year.

Cocoas furnish meat and drink, and are otherwise extensively useful to the Singalese, or natives of Ceylon. When the nut is fully ripe, its kernel is ground down, and water being poured on it, a white pulpy substance is produced, which, with rice, form the principal and best food of all classes of natives, from the chief to the day-labourer; and, when accustomed to them, Europeans of all ranks soon grow partial to a diet, which is not only agreeable to the palate, but light and wholesome to the constitution. The beverage which the green cocoa-nut affords is most delicious and cooling. The inside taken when quarter-ripe, may be appropriately termed a vegetable blanc-mange; in which state it may be eaten with a spoon, there being no difficulty whatever in removing the pulp from the shell. The addition of Madeira wine, with a few drops of lime juice, and a little sugar and nutmeg, so completely disguises it, that scarcely one person in a hundred would believe it to be a vegetable production.

The cocoa-nut tree yields another species of liquid, equally delicious and refreshing, called palm-wine, or toddy. Two months after the blossoming of the tree, the capsulated flower is first tied, to prevent its expansion, and then cut, so as to allow the juice to exude drop by drop. A supply is yielded morning and evening, the flower being cut a little every day. Europeans prefer toddy before sunrise, when it is a cool, delicious, and particularly wholesome beverage, acting as a gentle aperient; but the natives prefer it after fermentation has commenced, which takes place in about three hours. In that state, bread-bakers use it as yeast, for which it does admirably, the bread which is made from it being remarkably light and good. The lower classes of Singalese often intoxicate themselves with fermented toddy during the hottest parts of the day, when they may be seen in the neighbourhood of the toddy-shops, squatted on a log of wood, or on the bottom of an inverted canoe, in the full enjoyment of this vicious indulgence.

The next thing that the cocoa-nut tree yields is arrack or rack. This is a distillation of fermented toddy, one hundred gallons of which produce twenty-five of arrack. This spirit, when new, is considered injurious to the constitution; but after it has been kept some years, it becomes one of the wholesomest that can be made use of.

A recital of the duties of the cocoa-nut tree is yet far from being finished. Besides the foregoing products, it furnishes a species of honey and sugar. Eight gallons of sweet newly-drawn toddy, boiled over a slow fire, yield two gallons of a very luscious liquid called honey; which quantity being again boiled, a coarse brown sugar called jaggery, which is in general use by the natives, is the product. In manufacturing jaggery, it is formed into round cakes or buns, dried in the smoke of the huts, and, being tied in the dead leaves of the banana, is then ready to be kept for domestic use or for exportation.

The next article which the cocoa-nut tree produces is vinegar, which is made in a very simple manner from the toddy. The required quantity of toddy is collected in dry weather, put into jars, and well covered. After a month, the contents are strained, and replaced in the same jars, with the addition of a little Chili pepper, and some other hot spices. At the expiration of a month or five weeks, it becomes very excellent vinegar, nearly equal to European, for pickles, fumigation, and other purposes.

The next valuable product of the cocoa-nut tree is oil, of which there are different ways of manufacturing. The Singalese process is simple. Ripe cocoa-nuts removed from the shell are pounded in a large mortar, and having been taken out and pressed, the liquid is boiled over a slow fire; the oil which floats on the top being skimmed off, is subsequently boiled by itself. Two quarts of oil will be the product of fourteen or fifteen cocoa-nuts. When fresh, it is used in cookery, and is excellent. Cocoa-nut oil is burnt in all houses, from that of the governor to the cooley or labourer. It is also used as an ointment for the body and the hair; and the refuse from which it has been expressed, makes oil-cake for the fattening of pigs, poultry, and cattle.

This is not all the uses of the cocoa-nut. The liquid from it in a green state is used as a glue by plasterers in their white and other washes, for houses, verandahs, pillars, &c. The shells of the green nuts, when pared thin, are used as lanterns or lamps for illuminating roads and trees; also for ladles, skimmers, spoons; for making lampblack, and, when broken, they serve for fuel. The outer shells or husks, by steeping, furnish a fibrous matter, from which either large ropes or small cords may be manufactured as good as if made from hemp; also brushes, mats, and bags. The leaves of the tree are made into excellent baskets for the conveyance of fruits and other articles, and, when prepared in a particular manner, are used as torches by the natives. When the tree is in full leaf, it affords a delightful retreat beneath its shade from the heat of the sun; and the branches of this truly valuable tree, on being split, furnish a covering for houses and huts, as well as materials for many household articles; even the latches of the doors are made from the cocoa-nut tree. The branches also afford excellent stakes for the fencing of fields.

We have now to exhibit the cocoa-nut tree in quite a different character. It is the druggist of the Indians, and furnishes medicines for the cure of their diseases. A decoction drawn from the root is considered by the native doctors so efficacious in intermittent fevers as to be almost invariably employed by them. As a gargle, it removes complaints of the mouth and throat. With fish oil, the expressed juice of the leaves is a sovereign remedy in cases of hæmorrhoids. In ophthalmic complaints, the external application of the expressed juice of the nut, mixed with new milk, mitigates, if it does not entirely remove, inflammation. The expressed juice of the flower, mixed with new milk, and taken in small quantities, affords almost immediate relief, and if persevered in, a cure, in the debilitating complaints of hot climates. The bark affords an oil which cures diseases or eruptions of the skin. The shell reduced to charcoal is used as an excellent dentrifice or tooth-powder, and the water of the green nut is the best of all cosmetics for clearing the skin from wrinkles.

Such are the uses and virtues of the cocoa-nut tree, which has apparently been bestowed by the hands of a beneficent Providence for the use and happiness of the natives of tropical climates.*

* This article is the substance of a pamphlet, entitled "A Treatise on the Cocoa-Nut Tree," &c., by a Fellow of the Linnæan and Horticultural Societies, many years resident in Ceylon. London, 1831.

Column for Cottagers.

Persons in the humbler walks of life in the country have, in many instances, much spare time on their hands which they do not well know how to occupy with useful employment. After attending to their ordinary labour, and perhaps cultivating their gardens, and looking after a cow or a pig, they find little else to do, and may be induced to spend a period of their existence in listless idleness. But however profitless and discreditable it is to be idle, persons in the situation we mention can hardly be blamed. They are most likely willing to keep their minds and bodies in recreative employment, provided they knew how to set about it with a feasible prospect of remuneration. Now, we are going to put in their way a plan proposed by Cobbett, in his Cottage Economy, for the exercise of their industry, which has already been tried with great advantage in Orkney, where an immense number of individuals partially or wholly support themselves by it, and which may be pursued in any part of the United Kingdom. It consists of the cultivation and manufacture of grass or straw, for plat, used in making bonnets of the Leghorn species. "The cutting, the bleaching, the sorting, and the platting of straw (says this ingenious writer, who has the credit of introducing the process into this country), seem to be, of all employments, the best suited to the wives and children of country labourers; and the discovery which I have made, as to the means of obtaining the necessary materials, will enable them to enter at once upon that employment. Before I proceed to give my directions relative to the performance of this sort of labour, I shall give a sort of history of the discovery to which I have just alluded :—

The practice of making hats, bonnets, and other things, of *straw*, is perhaps of very ancient date; but, not to waste time in fruitless inquiries, it is very well known that for many years past straw coverings for the head have been greatly in use in England, in America, and indeed in almost all the countries that we know much of. In this country the manufacture was, only a few years ago, very flourishing; but it has now greatly declined, and has left in poverty and misery those whom it once well fed and clothed.

The cause of this change has been, the importation of the straw hats and bonnets from Italy, greatly superior, in durability and beauty, to those made in England. The plat made in England was made of the straw of ripened grain. It was in general split; but the main circumstance was, that it was made of the straw of ripened grain; while the Italian plat was made of the straw of grain or grass cut green. Now, the straw of ripened grain or grass is brittle, or rather rotten. It dies while standing, and, in point of toughness, the difference between it and straw from plants cut green is much about the same as the difference between a stick that has died on the tree, and one that has been cut from the tree. But besides the difference in point of toughness, strength, and durability, there was the difference in beauty. The colour of the Italian plat was better; the plat was brighter; and the Italian straws being small whole straws, instead of small straws made by the splitting of large ones, there was a roundness in them, that gave light and shade to the plat, which could not be given by our flat bits of straw.

It seems odd that nobody should have set to work to find out how the Italians came by this fine straw. The importation of these Italian articles was chiefly from the port of Leghorn; and, therefore, the bonnets imported were called Leghorn bonnets. The straw manufacturers in this country seem to have made no effort to resist this invasion from Leghorn. And, which is very curious, the Leghorn straw has now begun to be imported, and to be platted in this country; so that we had hands to plat as well as the Italians. All that we wanted was the same kind of straw that the Italians had: and it is truly wonderful, that these importations from Leghorn should have gone on increasing, year after year, and our domestic manufacture dwindling away at a like pace, without there having been any inquiry relative to the way in which the Italians got their straw! Strange that we should have imported even straw from Italy, without inquiring whether similar straw could not be got in England! There really seems to have been an opinion that England could no more produce this straw than it could produce the sugar-cane.

Things were in this state, when, in 1821, a Miss Woodhouse, a farmer's daughter in Connecticut, sent a straw-bonnet of her own making to the Society of Arts in London. This bonnet, superior in fineness and beauty to any thing of the kind that had come from Leghorn, the maker stated to consist of the straw of a sort of grass, of which she sent, along with the bonnet, some of the seeds. The question was, then, would these precious seeds grow and produce plants in perfection in England? A large quantity of the seed had not been sent; and it was therefore, by a member of the society, thought desirable to get, with as little delay as possible, a considerable quantity of the seed.

It was in this stage of the affair that my attention was called to it. The member just alluded to applied to me to get the seed from America. I was of opinion that there could be no sort of grass in Connecticut, that would not, and that did not grow and flourish in England. My son James, who was then at New York, had instructions from me, in June 1821, to go to Miss Woodhouse, and to send me home an account of the matter. In September, the same year, I heard from him, who sent me an account of the cutting and bleaching, and also a specimen of the plat and of the grass of Connecticut. Miss Woodhouse had told the Society of Arts, that the grass she used was the *Poa pratensis*. This is the smooth-stalked meadow-grass; so that it was quite useless to send for seed. It was clear that we had grass enough in England, if we could but make it into straw as handsome as that of Italy.

I made my experiments, and, in short, I proved to demonstration that we had not only the plants, but the sun also, necessary for the making of straw, yielding in no respect to that of America or of Italy. I think that, upon the whole, we have greatly the advantage of those countries; for grass is more abundant in this country than in any other. It flourishes here more than in any other country. It is here in a greater variety of sorts; and for fineness in point of size, there is no part of the world which can equal what might be obtained from some of our downs, merely by keeping the land ungrazed till the month of July. When I had obtained the straw, I got some of it made into plat. One piece of this plat was equal in point of colour, and superior in point of fineness, even to the plat of the bonnet of Miss Woodhouse."

Cobbett next describes the process of cutting and bleaching the grass:—"First, as to the season of the year, all the straw, except that of one sort of couch-grass, and the long coppice-grass, which two were got in Sussex, were got from grass cut in Hertfordshire on the 21st of June. A grass headland, in a wheat field, had been mowed during the forepart of the day; and in the afternoon I went and took a handful here and a handful there out of the swaths. When I had collected as much as I could well carry, I took it to my friend's house, and proceeded to prepare it for bleaching, according to the information sent me from America by my son; that is to say, I put my grass into a shallow tub, put boiling water upon it until it was covered by the water, let it remain in that state for ten minutes, then took it out, and laid it very thinly on a closely mowed lawn in a garden. But I should observe, that, before I put the grass into the tub, I tied it up in small bundles, or sheaves, each bundle being about six inches through at the butt-end. This was necessary, in order to be able to take the grass, at the end of ten minutes, out of the water, without throwing it into a confused mixture as to tops and tails. Being tied up in little bundles, I could easily, with a prong, take it out of the hot water. The bundles were put into a large wicker basket, carried to the lawn in the garden, and there taken out, one by one, and laid in swaths as before mentioned.

It was laid very thinly; almost might I say, that no stalk of grass covered another. The swaths were turned once a-day. The bleaching was completed at the end of seven days from the time of scalding and laying out. June is a fine month. The grass was, as it happened, cut on the longest day in the year; and, the weather was remarkably fine and clear. But the grass which I afterwards cut in Sussex was cut the first week in August.

The part of the straw used for platting is that part of the stalk which is above the upper joint; that part which is between the upper joint and the seed-branches. This part is taken out, and the rest of the straw thrown away. But the whole plant must be cut and bleached; because, if you were to take off, when green, the part above described, that part would wither up next to nothing. This part must die in company with the whole plants, and be separated from the other parts after the bleaching has been performed.

The time of cutting must vary with the seasons, the situation, and the sort of grass. The grass which I got in Hertfordshire, than which nothing can, I think, be more beautiful, was, when cut, generally in bloom; just in bloom. The wheat was in full bloom; so that a good time for getting grass may be considered to be that when the wheat is in bloom. When I cut the grass in Sussex, the wheat was ripe, for reaping had begun; but that grass is of a very backward sort, and, besides, grew in the shade amongst coppice-wood and under trees, which stood pretty thick.

As to the sorts of grass, I have to observe generally, that in proportion as the colour of the grass is deep—that is to say, getting further from the yellow, and nearer to the blue—it is of a deep and dead yellow when it becomes straw. Those kinds of grass are best, which are, in point of colour, nearest to that of wheat, which is a fresh pale green. Another thing is, the quality of the straw as to pliancy and toughness. Experience must be our guide here."

He next informs us that purple melica grass, fiorin grass, ray grass, yellow oat grass, crested dog's-tail grass, sweet-scented vernal grass, and brown bent grass, are those to be used in preparing to make straw plat; and then proceeds—"As it may be useful to speak of the expense of cutting and bleaching, I shall trouble you with a few words relating to it. If there were a field of ray-grass, of crested dog's-tail, or any other good sort, and nothing else growing with it, the expense of cutting would be very little indeed, seeing that the scythe or reap-hook would do the business at a great rate. Doubtless there will be such fields; but even if the grass have to be cut by the handful, my opinion is, that the expense of cutting and bleaching would not exceed fourpence for straw enough to make a large bonnet. I should be willing to contract to supply straw, at this rate, for half a million of bonnets. The scalding must constitute a considerable part of the expense, because there must be fresh water for every parcel of grass that you put in the tub. When water has scalded one parcel of cold grass, it will not scald another parcel. Besides, the scalding draws out the sweet matter of the grass, and makes the water the colour of that horrible stuff called London porter.

I cannot, in concluding these communications, refrain from making an observation or two on the consequences likely to arise out of these inquiries. The manufacture is alone of considerable magnitude. Not less than about five millions of persons in this kingdom have a dress which consists partly of manufactured straw; and a large part, and all the most expensive part, of the articles thus used, now come from abroad. Notwithstanding all this, if the manufacture were of a description to require, in order to give it success, the collecting of the manufacturers together in great numbers, I should, however great the wealth that it might promise, never have done any thing to promote its establishment. The contrary is, happily, the case: here all is not only performed by hand, but by hand singly, without any combination of hands. Here there is no power of machinery or of chemistry wanted. All is performed out in the open fields, or sitting in the cottage. There wants no coal mines and no rivers to assist; no water-powers nor powers of fire. No part of the kingdom is unfit for the business. Every where there are grass, water, sun, and women and children's fingers; and these are all that are wanted. But the great thing of all is this: that, to obtain the materials for the making of this article of dress, at once so gay, so useful, and in some cases so expensive, there requires not a penny of capital. Many of the labourers now make their own straw hats to wear in summer. Poor rotten things, made out of the straw of ripened grain. With what satisfaction will they learn that straw, twenty times as durable, to say nothing of the beauty, is to be got from every hedge! In short, when the people are well and clearly informed of the facts which I have adduced, it is next to impossible that the manufacture should not become general throughout the country. In every labourer's house a pot of water can be boiled. What labourer's wife cannot, in the summer months, find time to cut and bleach grass enough to give her and her children work for a part of the winter! There is no necessity for all to be platters; some may cut and bleach only; others may prepare the straw; and, doubtless, as the farmers in Hertfordshire now sell their straw to the platters, grass collectors and bleachers and preparers would do the same; so that there is scarcely any country labourer's family that might not derive some advantage from this discovery."

GEOGRAPHICAL DISTRIBUTION OF BIRDS.

The geographical distribution of the various races of created beings has excited considerable interest, and a mass of facts have been collected, which go far to prove that it is regulated by certain laws, chiefly dependent upon the conjoined influence of climate and temperature. Birds are equally subject to those rules, as might be expected from their more extended locomotive powers, their ranges are wider, and some groups and species are more generally spread over the world than those beings which require the assistance of a solid medium to transport themselves from place to place. Instances of this kind may be given in one or two examples. The great families of the falcons pigeons, and swallows, are universally diffused; parrots are found in every quarter of the world, except Europe; and woodpeckers are wanting only to New Holland. The peregrene falcon, so renowned in a noble but nearly forgotten sport, has its free range over the greater part of Europe, America, and Greenland, and has been sent from the distant continent of New Holland; the short-eared owl is common to Europe, Siberia, and the neighbourhood of Canton, in China; the common magpie extends over Europe, has been sent from the Himalayan range in India, and reaches to the cold regions of North America; while specimens of the glassyibis have reached this country from each of the four quarters of the world, besides from many of its far distant insulated lands.—*Naturalist's Library.*

SUNDAY AT CALCUTTA.

Forty years ago, little or no attention was paid to the Sabbath in Calcutta, so much so that there seemed hardly any difference betwixt Sunday and the other days of the week. Only one outward symbol was exhibited to assure people that it was the day of rest. "Oh," would one person say to another, "I see this is Sunday—the flag is hoisted at Fort William."

London: Published, with Permission of the Proprietors, by Orr & Smith, Paternoster Row; G. Berger, Holywell Street, Strand; Bancks & Co., Manchester; Wrightson & Webb, Birmingham; Willmer & Smith, Liverpool; W. E. Somerscale, Leeds; C. N. Wright, Nottingham; Westley & Co. Bristol; S. Simms, Bath; J. Johnson, Cambridge; W. Gain, Exeter; J. Purdon, Hull; G. Ridge, Sheffield; H. Bellerby, York; J. Taylor, Brighton; and sold by all Booksellers, Newsmen, &c. in town and country.—Chambers's Historical Newspaper, a Supplement to the present publication, is published on the first of every month; and Chambers's Information for the People, of which every number is a distinct subject of human knowledge, and which will be completed in one volume, appears once every fortnight.

FALLACIES OF THE YOUNG.

CLEVERNESS.

In the scene of human life presented to our observation, it appears obvious that there is a constant struggle going forward betwixt two great divisions of society—the aged and the youthful. Each of these parties acts upon opposite principles. The old have found, by experience, that no good can be obtained, no permanent comfort secured, without the exercise of a great deal of cool judgment and prudence. They abound in recollections of innumerable instances in their past lives, in which they lost anticipated advantages by precipitancy, and gained them by a cautious and patient line of conduct. They remember that, at every step in their career, they were impeded by the hurrying advance of others, or withheld by those who placed their sole enjoyment in gratifications by the way. In fine, they can describe that it was only by the due *control of the passions*, that they were enabled to succeed in their endeavours to attain a competence, or respectable independence.

The young, on the other hand, know almost nothing from experience. They start in the race of life with the most transcendant ideas of their own importance and abilities. Nobody that ever lived was half so clever as they are; and all the rest of the rising generation are fools in comparison with them. They will soon show the world what can be done by their cleverness in business; and they have no doubt but the whole town will very speedily be brought to admire their talent, and hasten to support them in their projects. And as for their foundering in their schemes, that is quite impossible: they will defy the cunningest sharper to cheat them; and they know perfectly well the vicious temptations which they ought to shun. Just let them alone, and give them a fair field, and they will show what can be done. All mankind have been wrong from the beginning of the world, and it is they who will now put them right.

Such is the nature of those vague notions which more or less affect the conduct of most young men entering upon a scene of active exertion, in which they are left to pursue the courses they choose to follow. It may be remarked, that at no period of life are people more averse from advice, than when they are thus let loose from the restraints of boyhood. To the admonitions of guardians, friends, or fathers, they listen with apathy, and turn away without being convinced. To the anxiously proffered advice of an aged parent, they most likely reply, "Well, father, that is all very true you say; but the world is now greatly changed since your young days, and the same measures will no longer succeed. There are ways of doing things now-a-days that you have no proper idea of; and just give me a trial, and I will soon astonish you with my skill and management." Of course, the old man withdraws his fatherly cares from the ingenious youth—perhaps only thinking of him afterwards as in a certain sense lost, or only brought to a painful knowledge of his existence by the calls privately made upon him for pecuniary subsidies.

To whatever degree of loftiness the pretensions of the young man may have aspired, it is not long before he begins to suspect that the world is neither so silly nor so easily prevailed upon to second his views as he imagined. Presuming upon his innate knowledge of mankind, in all their various classes, he affects an excess of liberality in his dealings. He enters into acquaintanceship with any body, provided they have but a genteel look; implicitly gives credit when sought for: does not heed lending a few pounds when craved with a confidential air; and even becomes security for several of his dearest friends. It is generally seen that he also reckons with an amazing degree of confidence on the effects of his personal appearance. Every thing about him is to attract universal admiration: The elegant contour of his hair; his handsomely made coat; the peculiarly genteel colour of his gloves; the graceful droop in the chain of his watch, which hangs round his neck in the most approved fashion—are all, in his estimation, to be at once productive of envy among his competitors, and the cause of the deepest admiration and love among all the young ladies who have the happiness or misery to behold him. The wise and accomplished young man further prides himself on his speculations in business. He tries to carry on trade by a sort of slight of hand, or by being up to every thing. Yet, somehow, he finds all will not do. His friends turn out unsubstantial visions: his elegant appearance fails entirely in gaining him either credit or respect: his means vanish in schemes which are proved to be unutterably ridiculous: and he at length makes the notable discovery, that other people are just as wise and as clever as himself. Thus, every succeeding year of his life, the young man thinks less and less of his own abilities, or power of swaying the world to his wishes. He learns, by dreary experience, that, after all, dullness with prudence gets on much better than activity and heedlessness. Above all, he finds that there is no possibility of attaining any great and profitable end without accommodating himself to a thousand petty circumstances that occur—without ministering to the prejudices or prepossessions of others—without submitting, perhaps, to many supposed contumelies and neglects—without manfully breasting every succeeding wave of adversity that threatens to swallow him up.

So common is the fallacy of self-sufficient cleverness among the youthful, and the corresponding disregard of advice from the aged, that it would almost appear as if our race were, in this manner, by a provision of nature, doomed to be retarded in its advancement towards perfection. If each generation were to start with the full advantage of the experience of the one which preceded it, it is impossible to conceive the height of prosperity and happiness at which mankind would have already arrived. But it seems to be nearly as difficult to endow with the wisdom of threescore the youth of five and twenty, as it is to train the muscles of a child of six years old to the energy and endurance of a full-grown man. As the body acquires strength in a regular gradation, so the mind also attains improvement by degrees. Nevertheless, we do not despond over the case of those who naturally repel admonition from their predecessors. There is at least one form in which good council presents itself without any circumstance which predisposes men to despise it, and that is the writings which the industry and learning of ages have now largely accumulated, and which the art of printing is daily extending. It is from the reiterated efforts of the press that we are principally to look for melioration in the tempers and in the behaviour of the people. In proportion as the young indulge in judicious reading, they will learn to reflect soundly—to see the absurdity of closing their understandings against the deductions drawn from familiar examples of ruin produced by self-conceit and impassioned heedlessness. They will thus, to a certain degree, acquire that which will stand them in the stead of experience in life—a dependence on the experience of those who have gone before them. In the same measure, by being made extensively acquainted with the abilities of others—the cleverness of their predecessors as well as of their neighbours—they will profitably be led to think much less of their own acquirements, and to put considerably less value on their own capabilities of action.

Occasionally we see young men who are less headstrong at the outset than those we have pointed out. A few seem to step at once, as it were, into the sagacity of the aged, and it is always seen that they prosper in proportion as their conduct is regulated by the admonitions of prudence. The success of these entrants on the stage of human life is found to have depended principally on the due regulation of their passions—for in this mainly lies the secret of advancement in society. They engage in their occupations with coolness and deliberation, warily lying in wait for opportunities of well-doing, and taking advantage of those false steps which precipitate others from the eminence they have partially gained. While the greater proportion of the young and thoughtless are dropping aside out of the ranks, and disappearing, and the aged are naturally falling away from amongst them, they are steadily pursuing their way, shutting their eyes and their ears against the various allurements that beset them—against the pretended friendships of the vicious or the simply contemptible—against, perhaps, the turbulence of their own appetites and passions—and so, by the time they have reached a mature manhood, they are already in the possession of those comforts and that honourable station that are the reward of virtue.

LEGEND OF THE LARGE MOUTH.

Arriving one evening at an inn in Glasgow, I was shown into a room which already contained a promiscuous assemblage of travellers. Amongst these gentlemen—*commercial* gentlemen chiefly—there was one whose features struck me as being the most ill-favoured I had ever beheld. He was a large pursy old man, with a forehead "villanous low," hair like bell-ropes, eyes the smallest and most porkish of all possible eyes, and a nose which showed no more prominence in a side-view than that of the moon, as exhibited in her first quarter upon a freemason's apron. All these monstrosities were, however, as beauties, as absolute perfections, compared with the mouth—the enormous mouth, which, grinning beneath, formed a sort of rustic basement to the whole superstructure of his facial horrors. This Mouth—if mouth it could be called, which bore so little resemblance to the mouths of mankind in general—turned full upon me as I entered, and happening at the moment to be employed in a yawn, actually seemed as if it would have willingly received me into its prodigious crater, and consigned me to the fate of Empedocles, without so much as a shoe being left to tell the tale.

The company of a traveller's room is generally very stiff, every man sitting by his own table in his own corner, with his back turned upon the rest. It was not so, however, on the present occasion. The most of the present company seemed to have been so long together in the hotel, as to have become very gracious with each other, while any recent comers, finding themselves plumped into a society already thawed and commingled, had naturally entered into the spirit of the rest. Soon discovering how matters stood, I joined in the conversation, and speedily found that the man with the large mouth was one of the most polite and agreeable of mankind. He was one of those old experienced gentlemen of the road, who know every thing that is necessary to be known, and are never at a loss about any thing. His jokes, his anecdotes, his remarks, were all excellent, and kept the rest bound, as it were, in a chain. The best of him was, that he seemed quite at ease on the subject of his mouth. No

doubt he was conscious of his preternatural ugliness—for, whatever may be said about the blinding effect of self-love and so forth, I hold that the most of people know pretty nearly how they stand as to personal attractions; but he had none of that boggling, unsteady, uncomplacent deportment, so remarkable in the generality of ill-looking people. On the contrary, there was an air of perfect self-satisfaction about him, which told that he either was so familiar with the dreadful fact as to mind it not, or that he was a thorough man of the world, above considering so trivial a particular, or that he was rich, and could afford to be detested. It was curious, however, that, even while he almost convulsed the rest with his jokes, he never laughed in the least himself. He evidently dared not. The guffaw of such a man must have produced consequences not to be calmly contemplated. Part, indeed, of the humorous effect of his conversation arose from the cautious way in which he managed his mouth. A small aperture at one side, bearing the same proportion to the whole that the wicket of a carriage-gate does to the whole gate itself, served for the emission of his words. Any thing else would have been a mere waste of lip.

On my ordering some refreshment, I was informed by the company, that, in consideration of this being the anniversary of a distinguished historical event, they had agreed to sup together in a rather more formal way than usual, and that they would be happy if I would join them. Having assented to the proposal, I began to reflect with some anxiety upon the probable conduct of the Mouth at table. How so extraordinary a Feature would behave, what it would ask for, after what manner it would masticate, and, above all, how much it would devour, were to me subjects of the most interesting speculation. "The wicket won't do there," thought I to myself, "or I am much mistaken." Yet, again—so ran my thoughts—many large men have been known to eat very little, while your true devourers are found to be lean, shrivelled creatures, who do not seem to be ever the better of it. "A large mouth," says the Scottish proverb, "has always a good luck for its meat." That may be, thought I, and yet the large Mouth may be quite indifferent to what it is so sure of getting. All kinds of ideas connected with this subject ran through my mind; but in the end I found it all a riddle. The Mouth might prove either gluttonous or abstemious, without exciting more surprise by the one event than by the other.

By and bye, some one asked a waiter if supper was nearly ready, and on an answer in the affirmative being given, I observed the Mouth suddenly bustle up, and assume an air of eager promptitude, that almost seemed to decide the question. The man rose, and, going to a corner of the room, where his greatcoat was hanging, brought forth a small package, which he proceeded to untie at a side-table. The only article it contained was a spoon, which he immediately brought forward and laid upon the table, accompanying the action with an air that might have befitted a surgeon in arranging his instruments for an operation. I had no longer any doubt as to the gastronomical character of the Mouth, for here was an article that might have served in the nursery of Glumdalclitch. It was an antique silver implement, with a short handle, and a rim about four inches in diameter, like an ordinary saucer. Observing the curiosity of the company to be strongly excited, the old man showed it round with good-natured politeness, telling us that he had been so long accustomed at home to the use of this goodly article, that he could now hardly discuss either soup or dessert without it, and therefore made a point of carrying it along with him in his travels. "But indeed, gentlemen," said he, "why should I make this a matter of delicacy with you? The truth is, the spoon has a history, and my mouth, none of the least you see, has also a history. If you feel any curiosity upon these points, I will give you a biographical account of the one and an autobiographical account of the other, to amuse you till supper is ready." To this frank proposal we all cordially agreed, and the old man, sitting down with the spoon in his hand, commenced a narrative, which I shall here give in the third person.

His mouth was the chieftain and representative of a long ancestral line of illustrious and most extensive mouths, which had flourished for centuries at a place called Tullibody. According to tradition, the mouth came into the family by marriage. An ancestor of the speaker wooed, and was about to wed, a lady of great personal attractions but no fortune, when his father interfered, and induced him, by the threat of disinheritation on the one hand, and the temptation of great wealth on the other, to marry another dame, the heiress of a large fortune and large mouth, both bequeathed to her by her grandfather, one of the celebrated kail-suppers of Fife. When his resolution was communicated to the tocherless lady, she was naturally very much enraged, and wished that the mouth of her rival might descend, in all its latitude, to the latest generation of her faithless swain's posterity; after which she took her bed, and—married another lover, her *second-best*, next week, by way of revenge. The country people, who pay great attention to the sayings of ladies condemned to wear the willow, waited anxiously for the fulfilment of her malediction, and accordingly shook their heads and had their own thoughts, when the kail-supper's descendant brought forth a son, whose mouth, even in his swaddling-clothes, reflected back credit on her own. The triumph of the ill-wisher was considered complete, when the second, the third, and all the other children, were found to be distinguished by this feature; and, what gave the triumph still more poignancy, was, that the daughters were found to be no more exempted than the sons from the family doom. In the second generation, moreover, instead of being softened or diluted away, the mouth rather increased, and so it had done in every successive generation since that time. The race having been very prolific, it was now spread so much that there was scarcely a face in Tullibody or the neighbourhood altogether free of the contagion; so that the person addressing us, who had his permanent residence there, could look round him upon several hundreds of kindred mouths, with all the patriarchal feelings of the chief of a large Highland clan.

If there had been any disposition in the family to treat their fate ill-humouredly, it would have been neutralised by the luck which evidently accompanied the introduction and transmission of this singular feature. So far, however, from entertaining any grudge or regret upon the subject, it had been the habit of the family to treat it as a capital joke, and to be always the first to laugh at it themselves. So much was this the case, that a wealthy representative of the family, about a century ago, founded—not an hospital or a school—but a spoon, which should be handed down from mouth to mouth as a practical and traditionary jest upon the family feature, and, though not entailed, be regarded, he hoped, as a thing never to be parted with for any consideration, unless fate should capriciously contract the mouths of his descendants to such a degree as to render its use inconvenient. This elegant symbol, after passing through the hands of a long train of persons, who had each been more able than another to use it effectively, came at length into the possession of the individual now addressing us—a person evidently qualified to do full justice to the intentions of his ancestor.

It was, therefore, with the apprehension of something awful, that, after the conclusion of the story, and the introduction of supper, I took a place at the well-spread board. In sitting down, I cast a look at the Mouth. It was hovering like a prodigious rainbow, over the horizon of the table, uncertain where to pitch itself. There was an air of terrible resolution about it, which made me almost tremble for what was to ensue. It was evident we were to have a *scene*.

The Mouth—for so it might be termed *par excellence*—was preferred by acclamation to the head of the table—a distinction awarded, as I afterwards understood, not so much on account of its superior greatness, as in consideration of its seniority, though I am sure it deserved the *pas* on both accounts. The inferior and junior mouths all sat down at different distances from the great mouth, like satellites round a mighty planet. It uttered a short gentleman-like grace, and then began to ask its neighbours what they would have. Some asked for one thing, some for another, and in a short time all were served except itself. For its own part, it complained of weak appetite, and expressed a fear that it should not be able to take any thing at all. I could scarcely credit the declaration. It added, in a singularly prim tone of voice, that, for its part, it admired the taste of Beau Tibbs in Goldsmith—"Something nice, and a little will do—I hate your immense loads of meat; that's country all over!" Hereupon, I plucked up courage, and ventured to look at it again. It was still terrible, though placid. Its expression was that of a fresh and strong warrior, who hesitates a moment to consider into what part of a thick battle he shall plunge himself, or what foes he shall select as worthy of particular attack. Its look belied its word; but again I was thrown back by its words belying its look. It said to a neighbour of mine, that it thought it might perhaps manage the half of the tail of one of the herrings at his elbow, if he would be so kind as carve. Was there ever such a puzzling mouth! I was obliged again to give credit to words; yet again was I disappointed. My neighbour, thinking it absurd to mince such a matter as a *Glasgow Magistrate*, handed up a whole one to the chairman. The Mouth received it, with a torrent of refusals and remonstrances, in the midst of which it began to eat, and I heard it continue to mumble forth expostulations, in a fainter and fainter tone, at the intervals of bites, for a few seconds; till behold the whole corporate substance of the burgal dignitary had melted away to a long meagre skeleton! When done, its remonstrances changed into a wonder how it should have got through so plump a fish; it was perfectly astonishing; it had never eaten a whole herring in its life before; it was an unaccountable miracle. I did not hear the latter sentences of its wonderments; but, towards the conclusion, heard the word "fowl" distinctly pronounced. The fowls lying to my hand, I found myself under the necessity of entering into conference with it, though I felt a mortal disinclination to look it in the mouth, lest I should betray some symptom of emotion inconsistent with good manners. Drawing down my features into a resolute pucker, and mentally vowing I would speak to it though it should blast me, I cast my eyes slowly and cautiously towards it, and made inquiry as to its choice of bits. In return for my interrogation, I received a polite convulsion, intended for a smile, and a request, out of which I only caught the important words, "breast" and "wing." I made haste to execute the order; and on handing away the desired viands, received from the Mouth another grateful convulsion; and then, to my great relief, all was over! Well, thought I, at this juncture, a herring and a fragment of fowl are no such great matters; perhaps the mouth will prove quite a natural mouth after all. In brief space, however, the chairman's plate was announced as again empty; and I heard it receive, discuss, and answer various proposals of replenishment made to it by its more immediate neighbours. I thought I would escape; but no—the fowl was really so good, that it thought it would trouble me for another breast, if I would be so kind, &c. I was of course obliged to look at it again, in order to receive its request in proper form; when, neglecting this time my former preparations of face, I had nearly committed myself by looking it full in the mouth, with my eyes wide open, and without having screwed my facial muscles into their former resolute astringency. However, instantly apprehending the amount of its demands, my glance at the Mouth fortunately required to be only momentary, and I found immediate relief from all danger in the ensuing business of carving. Yet even that glance was in itself a dreadful trial: it sufficed to inform me that the Mouth was now more terrible than before—that there was a fearful vivacity about it, a promptitude, an alacrity, and energy, which it did not formerly exhibit. Should this increase, thought I, it will soon be truly dreadful. I handed up a whole fowl to it, in a sort of desperation. It made no remonstrances, as in the case of the herring, at the abundance of my offering. So far from that, it seemed to forgive my disobedience with the utmost goodwill; received the fowl, dispatched it with silence and celerity, and then began to look abroad for farther prey. Indeed, it now began to crack jokes upon itself—a sportive species of suicide. It spoke of the spoon; lamented that, after all, there should be no soups at table whereon it might have exhibited itself; and finally vowed, that it would visit the deficiencies of the supper upon the dessert, even unto the third and fourth dish of *blancmange*. The proprietor of the mouth then laid down the spoon upon the table, there to lie in readiness till such time as he should find knives and forks of no farther service—as the Scottish soldiery in former times used to lay their shields upon the ground while making use of their spears. I now gave up all hopes of the Mouth observing any propriety in its future transactions. Having finished my own supper, I resolved to set myself down to observe all its sayings and doings. Its placidity was now gone—its air of self-possession lost. New powers seemed to be every moment developing themselves throughout its vast form—new and more terrible powers. It was beginning to have a *wild look!* It was evident that it was now *fleshed*—that its naturally savage disposition, formerly dormant for want of excitement, was now rising tumultuously within it—that it would soon perform such deeds as would scare us all! It had engaged itself, before I commenced my observations, upon a roast gigot of mutton, which happened to lie near it. This it soon nearly finished. It then cast a look of fearful omen at a piece of cold beef, which lay immediately beyond, and which, being placed within reach by some kind neighbour, it immediately commenced to, with as much fierceness as it had just exemplified in the case of the mutton. The beef also was soon laid waste, and another look of extermination was forthwith cast at a broken pigeon-pie, which lay still farther off. Hereupon the Eye had scarcely alighted, when the man nearest it, with laudable promptitude, handed it upwards. Scarcely was it laid on the altar of destruction, when it disappeared too; and a fourth, and a fifth, and a sixth look, were successively cast at other dishes, which the different members of the party as promptly sent away, and which the Mouth as promptly dispatched. By this time, all the rest of the party were lying upon their oars, observing, with leisurely astonishment, the progress of the surviving, and, as it appeared to them, endless feeder. *He* went on, rejoicing in his strength, unheeding their idleness and wonder, his very soul apparently engrossed in the grand business of devouring. They seemed to enter into a sort of tacit compact, or agreement, to indulge and facilitate him in his progress, by making themselves, as it were, his servitors. Whatever dish he looked at, therefore, over the wide expanse of the table, immediately disappeared from its place. One after another, they trooped off towards the head of the table, like the successive brigades which Wellington dispatched at Waterloo against a particular field of French artillery; and still, dish after dish, like said brigades, came successively away, broken, diminished, annihilated. Fish, flesh, and fowl, disappeared at the glance of that awful Eye, as the Roman fleet withered and vanished before the grand burning-glass of Archimedes. The end of all things seemed at hand! The Mouth was arrived at a perfect transport of voracity! It seemed no more capable of restraining itself than some great engine, full of tremendous machinery, which cannot stop of itself. It had no self-will. It was an unaccountable being. It was a separate creature, independent on the soul. It was not a human thing at all. It was every thing that was superhuman—every thing that was immense—inconceivably enormous! All objects seemed reeling and toppling on towards it, like the foam-bells upon a mighty current, floating silently on towards the orifice of some prodigious sea-cave. It was like the whirlpool of Maëlstrom, every thing that comes within the vortex of which, for miles round, is sure of being caught, inextricably involved, whirled round and round and round, and then down, down that monstrous gulf—

that mouth of the mighty ocean, the lips of which are overwhelming waves, whose teeth are prodigious rocks, and whose belly is the great abyss!

Here I grew dizzy, fainted, and—I never saw the Mouth again.*

POPULAR INFORMATION ON LITERATURE.

THE ITALIAN POETS.

Dante.

ALLUSIONS are frequently made in our literature to the Italian poets; and many persons who have seen these allusions till they are tired, perhaps hardly know who the Italian poets were, or what they did to render themselves so famous. If any one entertains curiosity on this subject, he will find it so far allayed by perusing this and the following short articles.

The Italian language, so remarkable for its vocal sweetness and delicacy, is one of the first modern tongues in which poetry was written. Poets all over Europe wrote their compositions in Latin, till about the twelfth century, when the persons called Troubadours, living in the south of France, began to write in their native language, and were highly successful in their efforts. The example was imitated in the Italian language, at first in Sicily, and afterwards in Italy itself, where there were some good poets soon after the year 1200. After that, Italy, though a scene of constant civil contention, became the birth-place of some of the greatest poets the world has ever seen—for it is a question with persons able to judge, whether even England has produced such great men in this branch of literature as the southern peninsula. It is at least certain that the Italian were the first models of the English, and also of the Scottish poets.

The chief poets of Italy are Dante, Petrarch, and Boccaccio, who flourished between the years 1300 and 1400; Ariosto, Guarini, and Tasso, who lived between 1500 and 1600; and Metastasio and Alfieri, who lived in the last century.

Dante, more properly designated Durante Alighieri, was born in May 1265; a period when the people of this island were considered as little better than barbarians, while learning was experiencing, in Italy, a revival that has gradually illuminated all the earth. He was a native of Florence, one of the principal cities in the north of Italy, and was descended from an illustrious family. He received an excellent education, and at an early period of life displayed great capacity for learning, and also a deep and refined sensibility. He fell in love, at nine years of age, with a young lady named Beatrice Portinari, of his own age, who became the subject and inspirer of his earliest poetical attempts. From an early age, he displayed a thoughtful and reserved, yet ardent character; was indefatigable in the acquisition of knowledge; and devoted himself in a peculiar manner to the study of theology. The passion he entertained for Beatrice seems to have been of too abstract and poetical a kind to suggest matrimony as its appropriate termination. He permitted Beatrice to marry another, and still loved on with as great an exhibition of poetical passion as before. At length she died, and he gradually fell in love with another lady, who had no recommendation to him but an apparent sympathy in his distress. Subsequently, the poet married a lady named Gemma di Manetto dé Donati, who is said to have proved a thorough shrew, and to have made his life very uncomfortable.

Literary and philosophical men in general are perhaps the least qualified to give or to experience happiness in married life, because they are apt to be too much bound up in their own pursuits to be good society to their wives, or to enter gracefully into that society which, in the deficiency of his own, the lady is perhaps inclined to call around her. The case, however, is infinitely worse, when there is any decided fault of temper in either of the parties. The phenomenon is then seen, of a man delighting all the world, while he is himself a prey to the most poignant vexations. Boccaccio's description of Dante's household is worth giving:—"He who before passed his hours in sacred study, and in holding communion with kings, emperors, princes, philosophers, and poets, and who could always soothe his sorrows by sympathising with those of others, was now, at the beck of his new wife, obliged to associate with whomsoever she pleased, and dragged from his own noble companions to listen to the arguments of women, and, if he did not wish to increase his misery tenfold, not only to listen to them, but to praise them. He who was accustomed, when weary of the crowd, to retire into some solitary place, and, there meditating, inquire what spirit moves the heavens, whence the living creatures of the earth draw their life, and what are the causes of things; or to meditate on some invention, or to compose something which should insure him a life after death, in fame—He, who was formerly thus employed, was now not only hindered from contemplation, but, whenever his new wife pleased, was forced into the society of persons in nowise disposed to such pursuits;—and yet more, he who was accustomed to laugh, to complain, to sing, or sigh, just as passion, pleasure, or love prompted, now either dared not do it, or must give his wife an account of why he did it; and not only in greater matters, but with respect to every little sigh, telling her whence it rose, and for what it was intended; his cheerfulness being regarded as a sign of his loving some one else; his melancholy as a proof that he hated her."

Dante was much trusted in public affairs, acted several times as an ambassador from his fellow-citizens to neighbouring states, and in the thirty-fifth year of his age, became one of the priors or magistrates of the city. The Florentine republic was then torn by the disputes of two rival families, the Donati and the Cerchi. Dante, who took part with the former, was at Rome pleading their cause with the Pope, when the opposite party overpowered the friends of the Donati, and drove them from the city. Dante, among other noble persons, was proscribed by the triumphant faction, and had his property confiscated. He never after was permitted to reside in Florence, but lived for many years as a wanderer on the face of the earth, sometimes under the protection of one noble person, and sometimes under another. The only circumstance of a consolatory nature in his fate, was, that he does not appear to have ever after been troubled with his wife.

For some time before his proscription, Dante had concentrated his genius upon a poem of great length, entitled the "Divina Commedia," which he completed during his exile, and which is one of the grandest compositions of this kind ever bequeathed to mankind. It is founded upon the religion of Dante's age and country, and describes a visionary journey through Hell, Purgatory, and Heaven, all of which are filled by the imagination of the poet with appropriate images. "We begin our journey with him," says his biographer,* "as if in company with a cowled ecclesiastic or metaphysician; but as we proceed, his voice and form seem to change, and as the darkness grows around us, he becomes greater and mightier, till when we enter the deep and woody way, and stand before the gate of the doleful city, we feel as he himself felt when his great master appeared before him in the solemn stillness of his valley, and amid forms that made even the air seem to tremble.

"The distinguishing characteristic of Dante's poetry, though it is far from wanting in occasional passages of exquisite tenderness and beauty, is its sublimity; and hence, by general consent, the Inferno [the part which describes Hell] is placed at an almost immeasurable distance above the other two parts of the Commedia, which required a milder and more brilliant fancy. In respect to sublimity, Dante has but one superior, our own Milton. The scenes he depicts have the terrible distinctness of places beheld in a vivid dream; the language of his personages makes an equally powerful impression on the mind—it is short, pointed, and abrupt, such as we might expect to hear from miserable beings dreading the fiery lash of pursuing demons, but retaining their sense of human sympathy. The same power appears in his comparisons as in the main subjects of the description. Over the images drawn from natural objects, or real occurrences, he flings the gloom or the lurid light of his subterranean caverns, rendering at the same time the abodes of condemned spirits the more terrible by the contrast of things still earthly and embodied. This sublimity, it is true, is far from being constantly sustained; and the verse not unfrequently falls off into a style as cold and harsh as it is obscure and unaffecting. But, in the first place, it was not possible that he should be always alike elevated; and, in the next, both the object of his poem, the learning which filled his mind, and the literary taste of the age, would lead him into most of the faults which disfigure the Commedia in the eye of a modern reader."

Besides this poem—written about the time of our Bruce and Wallace, and when vernacular poetry was unknown in Britain—Dante wrote an earlier and inferior work, styled the Vita Nuova, and a volume of Canzoni and Sonnets, also inferior. He likewise composed, in prose, the "Convivio," a commentary on his Canzoni, and a treatise "De Monarchia," designed for a political purpose. He died at Ravenna, in September 1321, a heart-broken exile, and was buried in that city. Not many years after, his native city, from which he had been so cruelly banished, endeavoured to get his remains, in order to give them that sure but too often sole reward of genius, a magnificent mausoleum; but the claim was indignantly refused. In a short time, although the press did not then exist to multiply and diffuse literary productions, the Divina Commedia was so highly appreciated, that public lectures were appointed in all the principal cities of Italy, for the purpose of explaining its mysterious and solemn beauties to the public. And although upwards of five hundred years have elapsed since this work first saw the light, it cannot be said to have suffered the least falling off in general estimation.

---

* This article is re-written from a small work by Mr R. Chambers, published in 1826, under the title of "Popular Rhymes of Scotland," where it was intended as a ludicrous illustration of the phrase—*the Muckle-mouthed Murrays*. The story had a slight foundation in fact, being amplified from an anecdote related to the author by a friend, as having fallen under his own observation. The writer was afterwards much surprised, when informed by Mr Howison Craufurd of Craufurdland, that in the family formerly possessed of that estate, and from a female branch of which he is descended, there was a legendary spoon similar to that described in Mr Chambers's volume, bearing the following inscription:—

This spuine I leave as a legacie
To the muckle-mou'ed Craufurds after me.

Mr Craufurd now possesses this heirloom; but, alas, the race to which it was appropriate, is, after an uninterrupted series of eighteen male descents, among the things that were—the last lineal representative being Colonel Craufurd, an ancient officer of high spirit and honour, of whom it is related, that he wilfully incurred the loss of his commission, by attending his friend and neighbour, the Earl of Kilmarnock, to the scaffold.

It may be mentioned, that, some time after the first publication of the above fantastic *jeu d'esprit*, an article bearing a close resemblance to it appeared in Blackwood's Magazine, with the signature, "A Modern Pythagorean," being the literary soubriquet, as he understands, of Dr Macnish of Glasgow, the ingenious author of the Anatomy of Drunkenness. He feels assured, that if Dr Macnish had been aware of the idea being already adopted by another person, he would either have abstained from writing upon it, or acknowleged that he was not the first to do so. It nevertheless seems necessary to make this explanation, in order that the prior writer may not fall under the suspicion of being the imitator

* The Rev. Henry Stebbing, in his late elegant work, the Lives of the Italian Poets.

THE AMERICAN STATE PRISONS.

ALMOST every civilised nation has a different mode of punishing criminals. In this country it is the practice, according to the nature of their crimes, to subject them to confinement in prisons and bridewells—to banish them from certain towns or districts—to transport them to distant penal settlements—and to put them to death by hanging. In some continental countries they are scourged—obliged to row the oars of boats or galleys—sent to dig in mines for life—and, if their outrages have been great, they are beheaded. In others there are large state prisons in which they are confined, but without any careful arrangement of classes. Generally speaking, it is the custom over the whole of Europe merely to punish criminals by certain severities, and the idea of reclaiming them to virtuous pursuits, or of quelling their passions by a peculiar system of discipline, hardly ever enters into the conceptions of the various governments. The Americans are the only people who have properly hit upon this notion. In the United States banishment is unknown, and the only crimes punished with death are murder and fire-raising. The plan generally pursued is incarceration in state prisons, in which the inmates are carefully supervised, kept from communicating with each other, and put to such a description of labour as will occupy their minds, and fit them for fulfilling the duty of good and industrious citizens on their liberation.

In the state of New York there are two or three great penal establishments, one of which is at Auburn, a flourishing town of 4000 inhabitants, situated on the outlet of the Oswesco Lake, and often made the object of a visit by travellers. Among others, it was lately visited by Mr Stuart,* whose excellent account furnishes the following details:—

"The prison is a large edifice, standing in an open space of ground 500 feet square, inclosed by an external wall 35 feet high. It contains the keeper's house, and necessary offices—the eating-hall, hospital, kitchens, and wash-rooms, and the cells, which are 7 feet long, 3½ wide, and 7 feet high. The windows in each, 4 feet by 6, are glazed, and secured by a strong iron grating. The only opening from the cell, except the ventilator, is the door, in the upper end of which is an iron grate, 18 by 20 inches. The bars of this grate are round iron, three-fourths of an inch in diameter, placed about two inches asunder, leaving orifices smaller than a man's hand. Through this grate all the light, heat, and air, are admitted to the cells. The ventilator, which is about three inches in diameter, extends from the back of the cell to the roof of the building. The door of the cell, of which the grate is a part, closes on the inner edge of the wall two feet deep. This recess in front of each door increases the difficulty of conversation and communication between the prisoners—prevents them from seeing into the galleries—and furnishes a convenient place for an officer of the prison to converse with the prisoner, without being seen or heard by those in the adjoining cells. The area round the cells, which is ten feet wide, is open from the ground to the roof, in front of five stories of cells. Of this area, three feet adjoining the cells are occupied by the galleries.

The shops or working-rooms are almost all attached to the outer wall of the prison, that wall being the outer wall of the shops. They are, when completed, to be about 1600 feet long, 26 feet wide, and 7 feet high on the side towards the yard, and 16 feet on the external wall. The side of the shops on the yard is lighted by a row of windows 4 feet by 3 feet 4 inches, and 2 feet 7 inches asunder. There is also a row of windows in the roof of the shops, consisting of an unbroken line of 7 by 9. In the rear of all the shops is an avenue or passway, made sufficiently light by numerous small openings cut in the partition, which enables the keepers to inspect the convicts without their knowledge, and also for visitors to pass through without going into the shops.

The prison is governed by a board of inspectors residing in the village, who are appointed every two years by the governor and senators of New York state, and who make such regulations as they think necessary, and appoint the keeper, deputy-keeper, physician, chaplain, and all the subordinate officers.

* Three Years in North America, by James Stuart, Esq. Cadell, Edinburgh; Whittaker, London.

When convicts arrive, they have their irons taken off, are thoroughly cleaned, and clad in the prison dress. The rules of the prison are explained to them, and they are instructed by the keeper in their duties—to obey orders, and to labour diligently in silence—to approach all the officers of the institution, when it is necessary for them to speak, with respectful language, and never to speak without necessity, even to the keepers; never to speak to each other under any pretence; nor to sing, dance, or do any thing having the least tendency to disturb the prison; never to leave the places assigned to them without permission; never to speak to any person who does not belong to the prison, nor to look off from their work to see any one; never to work carelessly, or be idle a single moment. They are also told, that they will not be allowed to receive letters, or intelligence from or concerning their friends, or any information on any subject out of the prison. Any correspondence of this kind that may be necessary must be carried on through the keeper, or assistant-keepers. A Bible is, by order of the state, put into each cell. The bodies of all criminals who die in the state prisons are, by order of the legislature, delivered to the College of Physicians when they are not claimed by their relations within twenty-four hours after their death. The state prisons being in the country—at a distance generally, it must be presumed, from the residence of the relations—such a claim can, it is obvious, be but rarely made.

For all infraction of the regulations or of duty, the convicts are instantly punished by stripes, inflicted by the keeper or assistant-keepers with a raw hide whip; or, in aggravated cases, under the direction of the keeper, or his deputy alone, by a cat made of six strans of small twine, applied to the bare back alone. Conviction follows offences so certainly and instantaneously, that they rarely occur; sometimes not once in three months.

At the end of fifteen minutes after the ringing of a bell in the morning, the assistant-keepers unlock the convicts, who march out in military order in single files to their workshops, where they wash their faces and hands in vessels prepared in the shops.

New convicts are put to work at such trade as they may have previously learned, provided it be practicable; if not, or if they have no trade, the keeper selects such trade as appears, on inquiry, best suited to them. The hours of labour vary according to the season. In long days, from half-past five A.M. to six P.M. In short days, the hours are so fixed as to embrace all the day-light.

At the signal for breakfast, the convicts again form in line in the shops, and are marched by the assistant-keepers to the mess-room, which they enter at two different doors, face around by their plates, standing till all have got their places, when a bell is rung, and all sit down to their meals: but as some eat more, and some less, waiters, provided with large vessels, pass along constantly between the tables, taking food from those who raise their right hand in token that they have it to spare, and giving to those who raise their left hand to signify they want more. The tables are narrow, and the convicts, sitting on one side only, are placed face to back, and never face to face, so as to avoid exchanging looks or signs.

When the steward perceives that the convicts have done eating, or have had sufficient time for it—generally from twenty minutes to half an hour—he rings the bell, when all rise and march to their workshops, those going out first who came in last. Twelve o'clock is the hour of dinner. The proceedings the same as at breakfast. Before quitting labour, the convicts wash their faces and hands—form line, according to the number of their cells—and proceed, in reversed order from that of coming out in the morning, to the wash-room, where, without breaking their step, they stoop, and take up their supper-vessels and water-cans, and march to their galleries, enter their cells, and pull their doors to. Each gallery is occupied by one company, which is marched and locked up by one assistant-keeper.

Assistant-keepers are constantly moving around the galleries, having socks on their feet, that they may walk without noise, so that each convict does not know but that one of the keepers may be at the very door of his cell, ready to discover and report next morning for punishment the slightest breach of silence or order. The house, containing between 500 and 600 convicts, is thus perfectly still. The convicts are required, by the ringing of a bell, to go to bed upon their framed flat canvass hammocks, with blankets, and are neither permitted to lie down nor to get up without a signal. After the convicts are rung down at night, all the locks are again tried by the assistant-keepers.

On Sundays the arrangement is the same, with this difference, that, instead of working, the convicts are marched to the chapel, where divine service is performed by the chaplain. Such of them as are ignorant, attend the Sunday school, which is admirably taught, and gratuitously by students belonging to the theological seminary at Auburn. The keeper and assistant-keepers must be present at divine service, and at the teaching in the Sunday school.

The rations for each man per day, are, 10 oz. pork, or 16 oz. beef; 10 oz. wheat flour, the wheat to be ground fine, and not bolted; 12 oz. Indian meal; ½ gill molasses—a ration. And 2 qts. rye; 4 qts. salt; 4 qts. vinegar; 1½ oz. pepper; 2½ bushels potatoes—each 100 rations.

From these provisions the convicts are supplied in the morning with cold meat, bread, a slice of cold hominy (a preparation of Indian corn), hot potatoes, and a pint of hot rye coffee, sweetened with molasses. For dinner, they have meat soup made from the broth, thickened with Indian meal, bread, hot potatoes, and cold water for drink. And for supper, a portion of mush (porridge made of Indian meal) and cold water. This quantity of food for each man is considered to be indispensably necessary when the labour is hard and constant, and not more than sufficient to enable the convicts to perform it, and to remain in the enjoyment of health. Labour, only interrupted by the time necessary for meals, is required from the convicts for eleven hours per day, when there is enough of daylight.

The convicts are so arranged in the shops, as not to face each other, and have their work entirely separate. A shop and business of a hundred are so managed, that hours frequently pass without a word being spoken. Spectators are taken through the inspection avenues in the rear, which surround all the shops, where they have a full view of the convicts without being seen. They are not allowed to speak so loud as to be heard by them. There are separate shops for carpenters, masons, coopers, toolmakers, shoemakers, tailors, weavers, blacksmiths, machinists, gunsmiths, chairmakers, cabinetmakers, and basket-makers. We saw some cabinet work beautifully finished. Indeed, all the work seemed to us well arranged, and systematically carried on. Carriage-making, polishing stone, and comb-making, have been begun during the year 1828.

The gains of the convicts during the last year averaged 29 cents, or 1s. 2½d. sterling per day, some of them earning as much as 50 cents, and others not more than 15 cents per day. The amount was sufficient to defray the annual expense, including the whole salaries of the keepers and other officers, the guard, and all the other officers.

Of 160 convicts discharged from Auburn, of whom accurate accounts have been obtained, 112 have turned out decidedly steady and industrious, and only 26 decidedly bad.

By this system, every prisoner forms a class by himself, and to all moral and social purposes he is insulated. The novice in crime may work for years by the side of the most expert felon, without making any progress in the mysteries of criminality. The prisoners are compelled to work diligently and profitably, and are deterred from spoiling their work; and we may add, as an important feature of this system, that, if any human means can, as it were, enforce repentance and amendment, it is this. The entire separation from all criminal associates—the sobriety of feelings consequent upon temperance and labour—and, most of all, the sadness of solitude, must frequently make serious impressions."

Such is the account given by Mr Stuart of this well-regulated and highly-praiseworthy American institution. It is much to be wished, that, in our own country, a plan of this kind, which seems to embrace all the objects which Howard and other philanthropists have endeavoured to attain, were established in the stead of our present singularly profitless and aimless system of punishment.

BIOGRAPHIC SKETCHES.

FLORA MACDONALD.

FLORA MACDONALD—celebrated for her concern in the escape of Prince Charles Stuart after the battle of Culloden—was the daughter of Macdonald of Milton, in the island of South Uist (one of the remoter of the Hebridean range), and nearly related to the chieftain of Clanranald, who asserts claims to be considered as the head of this distinguished Scottish name. Her father having died during her early life, her mother was married a second time to Mr Macdonald of Armadale, in the isle of Skye, who, according to the tradition of the family, accomplished the match by what was not then considered as either a dishonourable or dangerous expedient—namely, the abduction of the lady by force from her own house. Flora received the latter and better part of her education at a boarding-school in Edinburgh, from which she had just returned at the commencement of the insurrection of 1745.

The Clanranald Macdonalds, all except the aged chief himself, adopted, on this occasion, the cause of the young Pretender: the Skye Macdonalds, on the other hand, among whom was Flora's stepfather, remained at peace, though in general inclined to the same cause. After the disastrous conclusion of the enterprise, Charles fled in disguise to the Hebrides, and was concealed for several weeks in a hut in South Uist, under the protection of the chieftain of Clanranald and his lady, who resided at Ormiclade House, on that island. At length, towards the end of June 1746, the large parties of military, regulars and volunteers, who had been in pursuit of the prince, learned that he was in hiding somewhere on South Uist or the adjoining island, and I was resolved, in order that he might find no loop hole of escape, to sweep over the whole range from one extremity to the other, while the government vessels should hem the islands closely round, and prevent his getting away by sea. In this dilemma, it occurred to Lady Clanranald, as his protectress was designated, that the only chance of his escape lay in the possibility of getting him smuggled off the island, in female attire, and in the train of some young lady. It is said that two young ladies were requested in vain to enter into this scheme: the application was only successful in the third instance, when Miss Flora Macdonald, then residing with her brother the Laird of Milton, was prevailed on to hazard her life, in the hope of saving one whom she deemed a righteous prince, and the son of her sovereign. After a short interview with the prince, to whom she was introduced by his friend Captain O'Neil, she returned to the house of her brother, who remonstrated against the scheme, on account of what it exposed her to. But the heroic girl replied with the greatest coolness, that she could die but once, and situated as the prince was, she was determined to save him, or perish in the attempt. She then set out for the residence of the Clanranald family, in order to commence her perilous enterprise, accompanied only by her servant Neil MacEchan, a person who has lately been discovered to be the father of the celebrated Marshal Macdonald, created, by Napoleon Bonaparte, Duke of Tarentum. At one of the fords, she was arrested by a party of militia, and taken before their commander, who proved to be her own stepfather, Armadale. This gentleman, among others of the Skye Macdonalds, had taken up arms as militiamen in behalf of the government, but was, in reality, like many of his friends, attached to the opposite cause. From the documents we have consulted, we entertain little doubt that he was made confidant in the scheme of his daughter-in-law, and entered heartily into it. He granted her a passport to Skye for herself, her servant Neil, and a woman whom she called Betty Burke, a native of Ireland, and who, she said, was qualified to serve her mother as a spinner. Armadale even wrote a letter to his wife, recommending this unseen person to her for her alleged qualifications in that capacity. Betty Burke was in reality the name and character which it had been settled the prince was to assume in his passage to Skye.

On Friday, June 27, Miss Macdonald was conducted once more to the hiding-place of the prince, whom she found engaged in the humble office of cooking his own dinner, but nevertheless wonderfully cheerful and resigned. Next morning, Lady Clanranald received intelligence that the troops were at her own house, and had to return home to receive them. The skulking party then saw they had no more time to lose; and, accordingly, the prince having been dressed in a plain flowered linen gown, an apron and cap, so as to pass for an Irish serving-woman, they set sail at eight in the evening for Skye. They had hardly got a league from shore when the sea became tempestuous, and the wind shifting several times, the boatmen knew not in what direction they were going. Charles, seeing his companions to be much discomposed, endeavoured to sustain their spirits by singing and telling them stories. During the passage, Miss Macdonald fell asleep, and the prince took care to watch closely over her, so as to prevent the men from stumbling upon her. In the morning, they found themselves close to the point called Waternish, in the Isle of Skye, and it was with no small alarm that they saw a large body of soldiers on the shore. They immediately pulled off as hard as they could, while the soldiers made several balls whistle around them. Charles entreated his preserver to lie down in the bottom of the boat for safety; but she would not consent to do so, till he also agreed to take the same expedient.

They landed some hours after at Kilbride, near Troternish, about twelve miles north of Waternish; and while the prince remained on shore, the young lady, accompanied by her servant, walked to the house of Mugstot, the seat of Sir Alexander Macdonald of Sleat—a gentleman now in arms for the government, though originally a partisan of the Stuart family. Here Miss Macdonald was received very kindly by Lady Margaret Macdonald, wife of Sir Alexander; but it was with some alarm she found the commanding officer of a party of government troops conversing with her ladyship in the parlour. She nevertheless entered into an easy conversation with this gentleman, while Lady Margaret (a decided Jacobite, and previously apprised of the visitor she was to expect) took measures for furthering the progress of the skulking party through the country. There happened to be in the house a Mr Macdonald of Kingsburgh, who acted as Sir Alexander's factor at a distant part of the island, and whose friendliness to the Stuart cause could be relied upon. Him she engaged to go to the prince, who was still lingering on the shore, and to conduct him by byways to his own house. Kingsburgh performed this task with great adroitness, and the party was rejoined on the journey by Miss Macdonald, along with her servant MacEchan. In passing along, they met several parties of the country people returning from church, and it was with great difficulty that the prince, who was somewhat tall even as a man, contrived to escape observation. In the evening, he and Miss Macdonald were kindly entertained in Kingsburgh's house.

Next morning, the prince was again dressed in his female habiliments, Miss Macdonald putting on his cap with her own hands; and in the forenoon they set out for Portree, whence they expected to get the

unfortunate fugitive conducted to a neighbouring and safer island. At that village, Charles parted with his heroic preserver in a manner which has been thus described by an eye-witness:—"Then turning to Miss, he said, 'I believe, Madam, I owe you a crown of borrowed money.' She told him it was only half-a-crown, which he accordingly paid her with thanks. He then saluted her, and expressed himself in these or the like words, 'For all that has happened, I hope, Madam, we shall meet in St James's yet.'" He afterwards expressed the greatest concern that so amiable a man as Kingsburgh, or so heroic a girl as Flora Macdonald, should have subjected themselves to hazard for his sake.

Miss Macdonald was seized by the government troops in going home, and carried in a vessel to London, where she was confined for many months, though it would be difficult to define what law she had broken, or what punishment she deserved. Her story occasioned an intense interest in the society of the metropolis, and it is said that she received a visit from no less a personage than Frederick Prince of Wales, father to King George the Third. This individual asked if she would have protected him, if he had been in the same circumstances as the Pretender; to which she replied, that she would, if he had placed the same confidence in her. He was so much pleased with the reply, as to exert himself to procure her liberation. When enlarged from prison, she was taken under the protection of a Jacobite gentlewoman of high note, Lady Primrose of Dunnipace, who showed her off to all the persons well affected to the Stuart cause, as a pattern of female heroism and fortitude. It is the tradition of her family, that eighteen carriages belonging to visitors of distinction were sometimes seen ranked up before the door in a single evening. The flatteries and the presents which she received from these persons would have turned the heads of most young ladies; but upon the strong mind of this extraordinary heroine they produced no effect but surprise. She said, with dignified simplicity, that she never could see any thing remarkable in her conduct: it was only what the circumstances naturally demanded, and she conceived herself to have performed but a common duty.

Some years after returning to her native country, she was married (November 6, 1750) to Mr Alexander Macdonald, son of that Macdonald of Kingsburgh who had aided her in furthering the escape of the prince.* In time her husband's father having died, she became the lady of the house in which the prince and she had been entertained. Here, in 1773, she was visited by Dr Johnson and his friend Boswell, the latter of whom describes her as "a little woman of genteel appearance, uncommonly mild and well-bred." Soon after this period, she emigrated, with her husband, to North Carolina, where they purchased and settled upon an estate. It is a curious trait of enthusiasm, that she carried with her a half of the sheet in which Prince Charles had slept at Kingsburgh, intending that, whenever or wherever she died, it should serve as her shroud. Mr Macdonald had scarcely been settled on his property when the unfortunate contest between the colonists and the mother country involved him in trouble. Like most of his countrymen in America, he sided with the British government, and the consequence was, that he was imprisoned as a dangerous person. On being liberated, he took arms against the colonists, as captain in a regiment called the North Carolina Highlanders, and he and his wife met with many strange adventures in the course of the contest. At the conclusion of the war, they found it necessary to leave the country of their adoption, and return to Skye. In the voyage homeward, the vessel encountered a French ship of war, and an action ensued. While the other ladies were confined below, Flora insisted upon remaining on deck, where she endeavoured, by her voice and example, to animate the sailors. She was unfortunately thrown down in the bustle, and broke her arm; which caused her afterwards to observe, in the spirit of poor Mercutio, that she had now perilled her life in behalf of both the house of Stuart and that of Brunswick, and got very little for her pains.

She spent the remainder of her life in Skye, and at her death, which took place March 5, 1790, when she had attained a good old age, was actually buried in the shroud which she had so strangely selected for that purpose in her youth, and carried with her through so many adventures and migrations. She retained to the last that vivacity and vigour of character which has procured her so much historical distinction. Her husband, who survived her a few years, died on the half-pay list as a British officer; and no fewer than five of her sons served their king in a military capacity. Charles, the eldest son, was a captain in the Queen's Rangers. He was a most accomplished man: the late Lord Macdonald, on seeing him lowered into the grave, said, "There lies the most finished gentleman of my family and name." Alexander, the second son, was also an officer: he was lost at sea. The third son, Ranald, was a captain of marines, of high professional character, and remarkable for the elegance of his appearance. James, the fourth son, served in Tarlton's British legion, and was a brave and experienced officer. Lieutenant-Colonel John Macdonald, of Exeter, is, we believe, the only surviving son. There were, moreover, two daughters, one of whom, Mrs Major Macleod of Lochbay, in the isle of Skye, is still alive.

* Sir Walter Scott informed the writer of this narrative that he possessed the original warrant-contract of this escape.

LAST EXECUTION IN THE GRASSMARKET.

We have already presented to our readers instances of the value of circumstantial evidence in criminal cases, and of the danger which there may be in giving it more weight than is justly due to it. We now propose to narrate the case of an innocent man, who suffered death in consequence of a vicious peculiarity in the mode of giving in a verdict in Scotland.

In the month of October 1783, James Hay, James Andrews, and James Paterson, recruits in the 61st regiment of foot, then lying in Edinburgh Castle, happened to become intoxicated in a tavern a little way out of town. About seven in the evening, they set out on their return to the Castle. Andrews, who was only twenty-one years of age, proposed to go by the suburb of Portsburgh, to which they were very near; but Hay and Paterson prevailed upon him to go by the walk through the Meadows, which by night is a much less frequented passage. In going along the Meadow Walk, Hay went a little in advance of his companions, and Andrew saw him encounter and quarrel with a stranger, whom he succeeded in throwing down. Andrews hastened to interfere, and soon drew off Hay, leaving the stranger (whose name was Dykes) to go where he chose. When the party of recruits got to a little distance, Hay said, "Andrews, I've got his ticker," showing a watch which he had taken from the person of Dykes. Hay then prevailed upon Andrews, who was much intoxicated, to take charge of the stolen article; soon after which, they reached their quarters.

On awaking next morning, Andrews found himself possessed of a watch, which he was sensible was not his own, but could hardly recollect how it had come into his hands. With the directness of an ingenuous mind, he immediately proceeded to the quarters of Lieutenant Vernon, to whom he surrendered the watch, in order that it might be restored to the owner. The three young men were soon after apprehended. Andrews, in two different declarations before Sheriff Cockburn, told the whole truth so far as he could recollect it, with a candour which made a favourable impression on all who heard his story. He and his companions were nevertheless confined for trial. While lying in the Tolbooth, Hay made his escape in the manner related in a recent work by one of the editors of the present sheet.* On the 22d of December Andrews was brought forward for trial, Paterson acting as evidence against him; and so clear was the proof of his having been present at the robbery, and having afterwards possessed the stolen property, that the jury, by a majority, found him guilty, but unanimously recommended him to mercy.

This verdict proceeded from a misapprehension of the jury as to their powers. They conceived that they were only placed in the box to determine whether the facts of the accusation were proved; ignorant that, by the authority of all lawyers, they had in reality the right to judge whether the guilt of the accused was such as to render him worthy of being cut off from human society. The learned and ingenious William Smellie, known for his works in natural history, afterwards wrote a pamphlet, to show that jurors are judges of law as well as of fact, and that, when they think the crimes charged and proved too light to call for the punishment with which they are threatened, they are at liberty to give a verdict of Not Guilty, in order to clear the prisoner. This exposition, however, was too late to save the life of Andrews; and it is surprising that Scottish juries are yet sometimes found, even in cases where murder is the crime charged upon, to give a verdict of guilty, with a recommendation to mercy.

Immediately after Andrews's trial, the jury drew up a paper, in which they gave their reasons for recommending him to mercy, being chiefly what we have already stated. This paper was transmitted to the king, along with the report of the court upon the case, the minutes of the trial, and the evidence given thereon. But, by a letter from Lord Sydney, then one of the secretaries of state, the jury learned that no mercy was to be expected. The jury were afterwards informed, by a letter from their agent in London, that a report had prevailed that the foreman and some others of the jurors had retracted their former opinion, and thought the condemned man did not deserve mercy. Lest this report should have any effect on his majesty in council, the foreman wrote a letter to Lord Sydney, contradicting the report, and enclosing another copy of the reasons for recommending the criminal to mercy. To this letter no official answer was received.

James Andrews was therefore, notwithstanding his obvious innocence, hanged on the 4th of February 1784, being the last person executed in the Grassmarket. A circumstance connected with the melancholy ceremony came to be afterwards known, and deepened the impression made by the whole transaction upon the public mind. It appears that the real criminal, Hay, was at that moment concealed in the house of a friend, within a hundred yards of the scene of execution, and could hardly be restrained from going to the scaffold and delivering himself up to justice, in the hope of saving the innocent man. His mental sufferings during that hour are said to have been dreadful. Less striking situations have formed the material of tragedies.

There is now but one individual of Andrews's jury alive; and he, though advanced to that time of life when the feelings are apt to become deadened, can never hear the case alluded to, without tears of the bitterest regret.

* Reekiana, or Minor Antiquities of Edinburgh.

SCHOOLS IN ANCIENT TIMES.

By William Tennant, Esq. Author of "Anster Fair, a Poem."

Schools seem to have been established in Greece at a very early period of her history—perhaps even in the days of Homer they were common. Herodotus says that the Phœnicians, along with Cadmus, of whom the Gephyræ, who settled in Attica, were a portion, first together, with the importation of letters, established schools in Greece. About two hundred and fifty years after Cadmus' time, Pittheus, who was king of Troezene in Argolis, which he had founded, is spoken of as having taught a school in his own city. This is the first schoolmaster that we think is mentioned in history; and it is somewhat extraordinary, and certainly very honourable to the profession, that this man, so renowned for his wisdom and justice, did voluntarily, and out of pure love for his people, undertake, monarch as he was, to give lessons to his own subjects. He lived about 300 years before Homer, and 1240 years before the Christian era. He not only taught, but aided the progress of his subject-pupils by schoolbooks which he himself compiled. He composed a treatise either on grammar or arithmetic, which was afterwards published by an Epidamian, and which was extant in the days of Pausanias (A.D. 160), who says he had read it. A temple, dedicated to the Muses, was raised on the spot where this philanthropic schoolmaster-king was accustomed to give lessons. His tomb in Pausanias' time was still visible, with three thrones of white marble upon it, whence he, with other three judges, was wont to dispense justice.

The next celebrated schoolmaster to be met with, as we descend the tide of history, is no other than Homer himself, who, according to the only accounts on which it is safe to put reliance, taught, during the early part of his life, a public school at Smyrna. Homer's mother, a native of Cyme, had been hired by Phemius, a schoolmaster of Smyrna, who admitted her into his house and family for the purpose of spinning and dressing the wool received as school-wages from his pupils. As Homer grew up, old Phemius discovered more and more his talents; he adopted him at length as his son, and admitted him into his gymnasium as partner and assistant. The helper soon surpassed the master. On the death of Phemius and of Critheis, the mother of Homer, the bard succeeded to the sole management of the seminary; and having now become more prominent by having individually the direction, he very soon drew to himself the general attention and admiration, so that not only his own townsmen, but strangers, distinguished him by their special regards. He seems to have continued for several years in the quiet possession of this scholastic glory; till his thirst after knowledge, which in these days could be gratified principally by travelling, together with the unconquerable tedium of daily teaching, induced him to break up this tranquil scene of life, and to set sail for distant lands, that he might see, like Ulysses, men and manners. During his travels he was seized with blindness. On returning to Chios, he again, notwithstanding his blindness, set up school, and taught boys verses; it was there that he acquired money by these means; and there, it is supposed, he wrote his Iliad and Odyssey. In Homer's life, written by Herodotus (as it is understood), there is mention made of another schoolmaster who lived in Phoeæa, and made himself infamous by stealing and appropriating, as his own productions, the verses of Homer. In latter generations there were certainly schools not only in all the considerable or smaller towns of Greece, but even in the upland country villages—amid the rocky summits of Mount Ida in the Troad, were schools and schoolmasters to be found.

In Italy, also, schools were established contemporaneously with the earliest colonies from Greece. The first notice to be found any where in history of education being enforced upon all the youthful population by a positive legislative enactment, was the law of Charondas, who framed a code of laws for Thurium (or Sybaris), about the year before our era 450. According to Diodorus, he enacted that the children of all the citizens should be taught to read, and that, if their parents were too poor to defray the expenses, the city-funds should pay their instructors. "For," as the historian says, "he regarded education as the

foundation of all private and public happiness; he considered Nature as the giver but of life only; of living well and happily he regarded education as the great, yet easy accomplisher." The Greeks had festivals or holidays, celebrated annually in their schools, called Museia, or Feasts of the Muses. Their schoolrooms appear also to have been decorated with statues, of one, or two, or of all the nine Muses; whence the ode of Diogenes, who, passing one day into an auditorium, where were but a few scholars, with all the nine Muses, he remarked to the teacher, "With the gods, my friend, you have a good many scholars!" There was one peculiar regulation regarding the Greek schools, which is mentioned by Æschines, that no male person, unless pupils, should be permitted, under pain of death, to enter the schools, except the schoolmaster's son, his brother, or his son-in-law.

Of the philosophers and orators of Greece, many began their career by teaching reading or grammar, as Æschines, Isocrates, &c. They seem sometimes to have combined the modern departments of schoolmaster and professor, by teaching plain grammar, or reading in one part of the day to one class, and prelecting in philosophy in the afternoon to another. The number of scholars attending the Greek schools may be inferred from two circumstances, as noticed by Herodotus and Pausanias:—The former historian mentions, that, just previous to the subjugation of the Isle of Chios by Histialus, the roof of a school in that island fell upon the children while engaged at their lessons, and of the whole number, 120, only one was saved—an accident which was reckoned an omen from the gods prefigurative of their subjugation; and Pausanias speaks of one Cleanthes, a native of Astypularia, who, becoming frantic, rushed into a school of his native town, and, like Samson, plucking down the pillar which supported the roof, brought it down upon sixty scholars who were at their lessons. What vacations the Greek schools had, we know not. The philosopher Anaxagoras, who lived at Lampsacus, gave orders on his deathbed that the schoolboys of Lampsacus should enjoy play on the anniversary of his death, a festival which was kept up for many generations after the philosopher's death, and was called, from his name, Anaxagoreia, or the Feast of Anaxagoras. An enactment was once passed at Athens, that no teacher or lecturer should open a class without the authority of the senate and people, a restriction, under the evil influence of which, Theophrastus and the other lecturers left the city, and continued expatriated for one year, till the law was repealed. In Rome, during Appius Claudius's time, the public schools of the city (high schools) were all situated in the Forum.

The schools of Rome must have been celebrated before the reign of Augustus. The father of Horace, who lived in Apulia, sent his son to school at Rome. Dionysius, when divested of one species of tyranny—that over men—at Syracuse, found it expedient, as well as pleasant, to invest himself with another—that over children—at Corinth, still keeping his hand in daily exercise of rule either by the sceptre or the rod.

Of the Jewish schools, very little is known. The first mention of *writing* in the Old Testament, takes place in Exodus, xvii. 14, where reference is made to "*writing in a book*," as a practice already well known, and familiarly used by Moses and the people of Israel. As the practice of writing infers men employed for *teaching* not only *writing*, but *reading*, there must have been at this period, and perhaps long before this period, men who taught occasionally, or whose profession it was to teach both these arts. Cadmus, who was contemporary with Moses, and lived about 1490 years before Christ, not only imported letters from Palestine into Greece, but, as the Greeks themselves say, established schools for teaching them. This infers the existence of books, men of learning, and schools, in Palestine and the East, whence Cadmus, that *Man of the East*, emigrated. It is remarkable that Moses, being so well acquainted with writing himself, made no express law regarding education and the establishment of schools. He perhaps regarded it as an unnecessary injunction, being comprehended within the general directions given in Deuteronomy, vi. 7–9, where, amid other things, he bids his countrymen "*write these words upon the posts of the house and thy gates.*" Every Israelite, therefore, must have been taught to read and write, most probably by his father, in the bosom of his family, if not by the Levites, whose peculiar part of duty it was "to teach Israel the law." In being entrusted with this charge, did they merely read the law publicly, or teach to read privately, in conjunction with the former more important department of duty? Did they sometimes also hire out themselves as tutors to wealthy families, who could pay for such instruction, and who could support them? There is some appearance of evidence that the latter mode was not unpractised by them; for we have an instance of a Levite hiring himself out "*as a father and priest.*" "Dwell with me," said Micah to the Levite of Bethlehem-judah, "and be unto me a father and a priest, and I will give thee ten shekels of silver [about 25s. or 30s.] by the year, and a suit of apparel, and thy victuals." In officiating as priest, it is extremely likely that he also instructed Micah's children "as a father." Shortly after this period, and about 250 years before the era of the Jewish kings, there must have been, by profession, as it would appear, writers, as, in Deborah's song, that minstrel says, "out of Zebulun they that handle the pen of the writer" had assisted her against Sisera. Malachi, who lived near 800 years later, speaks of *master* and *scholar*; but it is questionable whether we may be warranted, from his use of these words, or rather our translation of them, to infer the existence of *schools*. Josephus speaks of his having attended a public school at Jerusalem, and outstripping at his lessons all his playmates; but was not this rather a Greek school, than one for his native language? and one for the rich, not for the poor? for, in John vii. 15, the Jews marvelled at our Saviour's knowing letters, being, as they conceived, the son of the carpenter. They said, "How knoweth this man letters, *having never learned*"—an expression which implies, that, then at least, the children of the poor were not generally taught letters. In the Bible there is mention only once made of a schoolmaster, and it is singular, as somewhat characteristic of the proverbial lordliness and autocratical assumption of the profession, that his name was *Tyrannus*, a tyrant.

NATURAL PHILOSOPHY.

GEOLOGY.

"Let us now direct our attention (says the authority from which we formerly quoted*) to a branch of knowledge which treats of the objects in nature as they really appear—Natural History. The field of natural history is wide indeed; it includes all nature. But as we cannot penetrate beyond the confines of the earth which we inhabit, we must be content to become acquainted with what it contains on its surface, or on its bosom. If we explore the animal, the vegetable, or the mineral kingdon,—if we mount into the atmosphere, or descend into the mine, we are impressed with the imperative necessity of our acquaintance with the different branches of physics. This demonstrates the mutual dependence of one branch of knowledge on another, and in the consideration of this dependence a field of interesting and delightful occupation is opened to us. Let us enter this field ourselves, and let us view these mutual relations.

It will be sufficient for our present purpose if we view the relations of natural history with the other branches of knowledge. The relations of these other branches among each other can be deduced from after consideration. It will also simplify our subject if we select some individual part of natural science, and then show its dependence upon other kinds of knowledge. The consideration of any one point will lead to that of others, and these to more, so that we have merely to choose the particular place from which we are to start; we shall have no difficulty in our way of gathering materials for comparisons.

The part of natural history which we have selected for our purpose is geology. There is, perhaps, no portion of physical science so well suited for exemplifying the relations of its different branches with each other. It treats of the '(Lyell) successive changes that have taken place in the organic and inorganic kingdoms of nature; it inquires into the causes of these changes, and the influence which they have exerted in modifying the surface and external structure of our planet.' It is the science of the earth which we inhabit—it is a science that may, at all times, be studied. If we explore the mountain or the valley, the quarry or the mine, we may every where find matter for reflection; we may read the book of creation, written in characters not to be misunderstood. The language admits of no misinterpretation—it is the language of facts.

The division of natural history that presses closest upon the attention of the geologist, is mineralogy. The mineral masses of the globe are what at first arrest his attention. If he walk through a cultivated country, he does not find geological phenomena of mineral substances so interesting as in districts more in a state of wild and uncultivated nature. Still there is much to claim his attention. The soil in the fields will differ in many places, and will furnish an index of the substratum. Thus he will distinguish the ferruginous clayey soil that indicates the underlying of basaltic rocks—the calcareous clayey soil resting upon mountain limestone—the chalky soil—the granitic soil, and various others. If he examine the low grounds, he will find the finer particles of clay accumulated in the lowest situations; along the slopes of the hills he will observe coarser parts of mineral substances, increasing in size as he approaches the rocky summits. If he enter into a mountain district, he will discover large masses of rocks in various states of disintegration, their harder parts withstanding the assaults of ages, their softer parts separated by various causes from the harder, and carried from these elevated regions to the lower parts of the country, by the agency of rivers and torrents. In examining these mineral substances, he will find his knowledge of mineralogy brought into requisition. If his knowledge of it be extensive, he may be enabled to discover something that may not have been known before. If his knowledge of it be slight, he will find this examination of nature an excellent exercise and means of improvement.

An acquaintance with chemistry is also requisite in the study of every department of natural history. In zoology and in botany we find it constantly referred to for the explanation of the vital functions and the composition of animal and vegetable substances. In mineralogy its importance is still greater, from the circumstance that the elementary bodies found in plants and animals are very few in comparison with those composing minerals. In the view of the changes that have taken place in the globe, we are struck with the important part played by chemical agency. We can conceive no alteration produced either on the surface or in the interior of the globe in which this agency was not, in a greater or less degree, exerted. If we regard the action of existing causes, still going on, in altering the surface of the earth, we shall find at every step appeal made to chemical knowledge.

A knowledge of mechanical philosophy is also required by the student of geology. The laws of attraction and of motion are always in action, and no change can take place in the globe at variance with these laws. The consideration of the subject of attraction is of great importance to the geologist; it leads him into the examination of the density of mineral masses, and of the globe itself. It will solve many phenomena which at first sight may seem anomalous. The application of the laws of motion will be also a powerful auxiliary, whether we view the movement of great mineral masses, or of their fragments; or that of currents in the atmosphere, or the ocean.

The connection of hydrostatics with geology is of the greatest importance. The vast ocean which covers so much of the earth's surface is subject to hydrostatical laws; so are the lakes and rivers. Many phenomena of the torrents that rush from the mountains upon the plains, and which are so important agents in modifying this surface, will be understood by applying the laws of hydraulics. Many geologists have conceived the globe itself to have been at one time in a state of fluidity. How are we to criticise the opinions of these philosophers, but by assigning the truth of their conclusions to the standard of hydrostatics.

The atmosphere surrounding the globe may be said to fall within the province of the geologist. In any system of cosmogony that has been, or ever can be, invented, the atmosphere will play a prominent part, as its original formation must be accounted for. It is the grand cause of most of the alterations that take place on the surface of the earth. It is the cause of the rain that fertilises one portion of this surface, while it gradually wears down another, and of the snow that caps the lofty mountains, which is the magazine for supplying rivers and lakes. It is the supporter of plants that cover the earth, and that modify its superficies in an infinite variety of ways; in fact, to dilate upon this subject would require a separate memoir.

The geologist must also take into consideration electrical phenomena. By some cosmogonists, electricity is made to play a very prominent part in the formation of the earth; we must therefore be acquainted with it in order to combat them with their own weapons. The knowledge of the different electric states of bodies is also of the first importance in the explanation of many of the natural phenomena. At times of volcanic eruptions, or of earthquakes, these phenomena become most interesting, and will, if viewed by a well-informed observer, be turned to good account in elucidating the history of our planet. The discoveries made by some philosophers in galvanism have been applied to expound geology; several have conceived they had obtained a key for the solution of all difficulties in the action of oxygen upon the bases of the alkalies and earths brought to light by galvanism. The science of magnetism is still in its cradle, but its connection with geology is most intimate. It is now under the fostering care of some of the most eminent philosophers, and will, I am sure, ere long, throw much light upon geology.

With the science of astronomy, geology is linked in the closest degree. In the early ages of knowledge, the attention of men was turned to the contemplation of the heavens, and many years of observation taught them to recognise the celestial bodies. Their imaginations invented many fables with regard to the stars and planets. This play of fancy descended to the earth, and from astronomy the mind of the ancient philosopher was led to consider the subject of cosmogony. In the ancient systems of astronomy, the earth is regarded as a vast plain, and the ancient notions of its formation and alterations, especially by deluges, are all grounded upon the supposition of its being a plane superficies, with the exception of the doctrine of the Pythagoreans. That the earth is of a plane figure, would strike the mind more forcibly than its possessing a spherical shape. This latter opinion is the result of deep and laborious reflection. The causes of error among the early cosmogonists are in this case extremely manifest. An advanced state of the science of astronomy was requisite to prove to the satisfaction of all that the form of the earth is globular.

It has been supposed by some philosophers of the last century, that there has been a change of climate in the different regions of the earth's surface, as the remains of organic beings are found in situations where, had they lived, it would have been impossible for them to have existed under the circumstances of the present temperature of those places. They have conceived a solution of this difficulty will be that the poles of the globe have changed their positions, and

* Dublin University Magazine, which contains many valuable literary articles, and may be recommended as exceedingly worthy of perusal. The permanent establishment of such a periodical work in Dublin is a gratifying indication of the improved taste for literature in Ireland.

still continue to do so—that at one time their points were in the present equator, and that the frigid regions were where the torrid now are. This supposition can only be refuted by a very refined train of astronomical investigation, and it was left to the immortal Laplace to demonstrate its incorrectness, and that, although there is a trifling shifting of the extremities of the terrestrial axis, these irregularities are confined within certain limits, and are the consequence of the extreme perfection of the system of the world. In many other particulars, the connection of geology and astronomy might be shown, but the investigation would lead us into a field that would require a separate paper to describe.

Although the connection of optics with geology may not at first strike us as being very manifest, its indirect relations are very important. Of late years, very singular discoveries have been made in optics, particularly by Dr Brewster. These discoveries refer to the action on the sight of bodies having a crystalline form; a very remarkable connection has been observed between their chemical composition, crystalline structure, and optical phenomena. These discoveries will evidently improve the science of mineralogy, and the more it is improved, the better will geology be elucidated. From the intimate connection of astronomy and geology, and of astronomy with optics, especially with regard to the instruments for observing the celestial bodies, the improvements in these instruments, by adding to our knowledge of the heavens, will enable us to extend our acquaintance with the earth. The invention of the microscope has unfolded the secret of organization, and as geology treats of the organic, as well as of the inorganic changes of the kingdoms of nature, the minuteness of which eludes the observation of the naked eye, it will be appreciated in the highest degree.

In the study of natural philosophy, we cannot proceed far without the aid of mathematics. In geology itself, there are many points that require immediately the mathematical skill of the observer; so that, viewed both directly and indirectly, mathematics must be understood by the geologist. I have shown that the philosophers of antiquity who proposed systems of cosmogony, were all geometers, and among the moderns, many illustrious names—I need only quote that of Playfair for example—have been distinguished alike for mathematical and geological knowledge. An acquaintance with civil history is likewise required. As history teaches us the progress of human society, and informs us of the changes that have taken place in human institutions, so geology instructs us in the mutations of organic and inorganic nature. Where there are records of natural changes preserved in the pages of history, its connection with geology becomes more intimate, and is often of the greatest value.

As knowledge becomes more cultivated by different nations, the language spoken by those nations should be attended to by the student. Many of the natural appearances of a country cannot be described in a manner to bring them before the eye of the reader so well as in the language of that country. Foreign literature is now so much extended, that it would be both impossible and unprofitable to translate all the eminent publications that are almost daily issuing from the continental press. Periodical literature is an invention of modern times. Periodical publications must be read in the language in which they are originally written, in order that their full force and importance may be felt. It is also proper that the opinions of the ancients should be studied in their respective tongues. The difficulty of acquiring languages has been much decreased of late years, by the improvements in the mode of learning them, and the knowledge of one or two will open to the student the gates of as many more as he may desire to study.

With intellectual philosophy, the connection of geology is very interesting. A true system of geology can be the result only of a highly refined train of reasoning. I have shown the imperfection of the ancient mode of reasoning, and its consequent influence on physical science. Bacon pointed out to men the true mode of observing the system of nature. In studying geology, we should be aware of the proper mode of conducting our reasonings from facts, and be alive to our liability to commit errors. The science of logic here lends its aid, and matter is aided by the powers of the mind.

We will readily arrive at the conclusion, that, if an improvement take place in any one department of knowledge, it cannot fail to be of use to all the others. The connection which I have endeavoured to show between geology and the other branches of philosophy, will furnish us constantly with illustrations. In fact, we cannot study any one circumstance in science in an isolated manner. We must view its relation to others in order to understand it.

Referring, again, to the definition of geology, that it treats both of the organic and inorganic changes of nature, we may recal an important observation which we made a little way before, that it requires a knowledge of the productions of the animal and vegetable kingdoms. If the attention of the geologist be confined to the consideration merely of the mineral masses of our globe, his exertions will be placed within narrow limits—his science will be incomplete—he must regard attentively the remains of organised beings enshrined in many of these mineral masses—he must compare them with existing species—he will discover many exuviæ of beings very different from the races that now inhabit the earth—he will observe the bones of gigantic mammalia and reptiles, the types of which are not now to be found—of fishes, birds, and insects—an immense variety of fossil shells, scarcely any of which agree with existing species—he will discover the remains of plants, many of which he will in vain endeavour to reconcile with those that now clothe the surface of the earth. But the knowledge of these fossil remains is still in its infancy—the geologist must therefore do his utmost to improve this knowledge—he must be previously acquainted with those natural productions, both animal and vegetable, that are now found on the earth—he must study zoology, in order to know the external forms of animals, their habits, and instincts, and anatomy, that he may be able to recognise the species of fossil bones. To understand the connection of the external forms of animals with their internal structure, he must be acquainted with physiology. The connection of conchology with geology is of the closest description. When an ignorant person observes another gathering shells upon the beach, he is inclined to despise him, considering the occupation as one belonging to children. When he sees him searching for shells imbedded in rocks, he thinks the sanity of the collector to be dubious. He little suspects that these imbedded shells are part of the language in which the history of the globe is recorded. They have been called the medals that illustrate its annals. The science of botany enables the geologist to investigate the remains of plants found in strata. To compare them with existing species is a most interesting task. The wonders of the antediluvian world are developed by this application of zoology and botany. This illustrates how intimately the different branches of natural history are linked with each other. The additions made to them within a very recent period are so great as to astonish when enumerated. At the present moment, the utmost zeal is manifested to acquire a knowledge of natural productions, both recent and fossil. The geologists of the present day vie with each other in their investigation of organic remains. The illustrious Cuvier applied his profound knowledge of anatomy to the examination of bones found in strata; his steps have been followed by a number of other ardent inquirers. The vast variety of shells, corallines, and other remains of the lower animals, discovered in rocks, are undergoing a strict scrutiny by naturalists well versed in the knowledge of recent productions. Very lately the examination of fossil plants has excited the ardour of several of the students of natural science, and their labours are likely to be rewarded ere long with an abundant harvest of facts. Geology is thus becoming based upon a sure foundation—it is showing itself worthy of the attention of the philosopher. The more facts that may be discovered, the surer will be the foundation upon which it will rest. The improvements in the other departments of physical and intellectual knowledge will contribute to cement the superstructure, while the study of the science itself will form one of the greatest means of human happiness."

ADDRESS TO THE BELL-ROCK LIGHTHOUSE.

Strange fancies rise at sight of thee,
Tower of the dim and silent sea.
Art thou a thing of earth or sky,
Upshot from beneath or let down from on high—
A thing of the wave or a thing of the cloud,
The work of man or the work of God?
Old art thou? Has thy blue minaret
Seen the young suns of creation set,
Or did but the yester years of time
Wake their old eyes on thy youthful prime,
Creature of mystery sublime?

Strange are thy purposes and fate,
Emblem of all that's desolate.
Outcast of earth, as if curs'd and exil'd,
Thou hast taken thy place on the ocean wild,
And rear'st, like a mournful repentant Cain,
Thy conscious and flame-letter'd brow on the main,
Telling all who might come to companion and cheer,
"Oh! shun my abode of destruction and fear!"

Hermit of the waste of sea,
Loneliest of all things that be,
Ev'n the pillar'd enthusiast was nothing to thee!*
In calm and in sunshine, in gloom and in storm,
Thy constancy shrinks not, nor changes thy form.
Times and seasons change—but thou never changest;
Range all other sea-things—but thou never rangest.
Morn breaks on thy head with a blush and a smile,
Noon pours all his splendours around thy lone pile;
The long level sunbeams that gild thee at eve,
Cast thy shade till 'tis lost o'er the far German wave;
Or night falls upon thee, as dew falls on tree—
But these alternations are nothing to thee.
Let the sea, as the heaven which it mirrors, be calm,
And each breath of the breeze bring its own load of balm.
Or let the bleak pavement be traversed and torn,
By those white-crested waves, on the north-westers borne,
Which seem, as they rush to Old Albany's strand,
A new troop of Norsemen invading the land.
Or let the rough mood of this long-trooping host,
In the madder conflict of the tempest be lost,
And to the wild scene deepest darkness be given,
Save where God pours his fire through the shot-holes of heaven,
In calm and in breeze, amidst tempest and flame,
Thou art still the same beautiful, terrible same.

September 1826. R. C.

* The anchorites of the middle ages, who sat for years on the tops of tall columns in the desert, are here alluded to.

WINTER TRAVELLING IN CANADA.

(From Head's Forest Scenes in North America.)

When we started this morning (January 10), the light was just beginning to dawn, and we had a heavy day's work before us before we could arrive at any habitation; however, there was no remedy but to push on with the rest. The guides to-day seemed particularly considerate, and, as if to give us every assistance, instead of driving recklessly on ahead, as they had been used to do, leaving us to follow as well as we could, and grumbling whenever they halted to collect the party, they now slackened their pace with great apparent good humour, and we all went on close together. However, we had not travelled more than half an hour before they proposed that we should all walk first by turns. And their object by this arrangement clearly was in case any of us should break in through the ice, to give us, with themselves, a fair chance of a preference. This was reasonable enough, and although they had undertaken to be our guides, we could make no objection so far to become theirs; and so it was settled that we were to exchange places every half hour. The labour was a good deal increased by being the first to break the way, and one thought of nothing else but being relieved from the task. The snow-shoe makes a large track, so that the second man has a surface to walk upon which has been pressed down by the first, who, of course, has by far the hardest work of all.

And so we fagged on, careless of consequences; for the depth of the snow upon the bed of the river made it quite impossible to pick our way. Our guides prescribed the course from point to point according to their notion of the safety of the ice, and the line being once determined on, we had only to advance straight forward, and trust altogether to good luck. Long circuitous paths became thus indispensable, and the danger of breaking in after all, certainly was not trifling. In the meantime, we were progressing heavily and slowly, hardly saying a word to each other, except when, at the expiration of each half hour, it became necessary to exchange places with the leading man. And this was not all, for the clouds, which had been all the morning unusually dark and lowering, seemed to bear strong indications of an approaching snow-storm. At this juncture, one of the party, a strong and apparently athletic young man, began to complain of lameness in his knee, which had swollen and had become very painful. Still, however, we went on, and it grew darker and darker, till a heavy fall of snow, driven by a powerful wind, came sweeping along the desert track directly in our teeth; so that, what with general fatigue, and the unaccustomed position of the body in the snow-shoes, I hardly could bear up and stand against it. The dreary howling of the tempest over the wide waste of snow rendered the scene even still more desolate; and with the unmitigated prospect before us of cold and hunger, our party plodded on in sullen silence, each in his own mind well aware that it was utterly impracticable to reach that night the place of our destination.

But, in spite of every obstacle, the strength of the two Canadians was astonishing; on they marched, drawing the tobogins after them with a firm indefatigable step; and we had all walked a little more than seven hours, when the snow-storm had increased to such a pitch of violence, that it seemed impossible for any human creature to withstand it: it bade defiance even to their most extraordinary exertions. The wind now blew a hurricane. We were unable to see each other at a greater distance than ten yards, and the drift gave an appearance to the surface of snow we were passing over, like that of an agitated sea. Wheeled round every now and then by the wind, we were enveloped in clouds so dense, that a strong sense of suffocation was absolutely produced. We all halted: the Canadians admitted that farther progress was impossible; but the friendly shelter of the forest was at hand, and the pines waved their dark branches in token of an asylum. We turned our shoulders to the blast, and, comfortless and weather-beaten, sought our refuge. The scene, though changed, was still not without interest; the frequent crashes of falling trees, and the crackling of their vast limbs as they rocked and writhed in the tempest, created awful and impressive sounds; but it was no time to be idle: warmth and shelter were objects connected with life itself, and the Canadians immediately commenced the vigorous application of their resources. By means of their small light axes, a good sized maple tree was in a very few minutes levelled with the earth, and in the meantime we cleared of snow a square spot of ground, with large pieces of bark, ripped from the fallen trees. The fibrous bark of the white cedar, previously rubbed to powder between the hands, was ignited, and blowing upon this a flame was produced. This being fed, first by the silky peelings of the birch bark, and then by the bark itself, the oily and bituminous matter burst forth into full action, and a splendid fire raised its flames and smoke amidst a pile of huge logs, to which one and all of us were constantly and eagerly contributing.

Having raised a covering of spruce boughs above our heads, to serve as a partial defence from the snow, which was still falling in great abundance, we sat down, turning our feet to the fire, making the most of what was, under circumstances, a source of real consolation. We enjoyed absolute rest! One side of our square was bounded by a huge tree, which lay stretched across it. Against this our fire was made; and on the opposite side, towards which I had turned my back, another very large one was growing, and into this latter, being old and decayed, I had by degrees worked my way, and it formed an admirable shelter. The snow was banked up on all sides nearly five feet high, like a white wall, and it resolutely maintained its position, not an atom yielding to the fierce crackling fire which blazed up close against it.

The Canadians were soon busily employed cooking broth in a saucepan, for they had provided themselves much better with provisions than I had. I had relied upon being able to put up with the fare I might meet with, not taking into consideration the want of traffic,

and distance from the civilized parts of the province; owing to which the scanty provision of the inhabitants could not allow them to minister to the wants of others, although they might be provided with a sufficiency for themselves. And I now saw the guides pulling fresh meat out of the soup with their fingers, and sharing it liberally with my servant, whom they had admitted into their mess. The poor fellows, seeing that I had nothing but a piece of salted pork, which I had toasted at the fire on a stick, offered me a share of their supper; but this I felt myself bound to decline. My servant had fewer scruples, and consequently fared better. In return for their intentions, I gave them a good allowance of whisky, which added to their comfort and increased their mirth. One by one they lighted their tobacco-pipes, and continued to smoke, till, dropping off by degrees, the whole party at last lay stretched out snoring before me.

Large flakes of snow continued to fall, and heavy clots dropped occasionally upon the ground. Our enormous fire had the effect of making me so comfortably warm, that I had deferred the use of my buffalo skin till I lay down to sleep, and, were it not for the volumes of smoke with which I was at first disturbed, and the pieces of fire which burnt holes in my clothes wherever they happened to fall, my lodging would have been, under circumstances, truly agreeable. I sat for some time, with a blanket thrown over my shoulders, in silent contemplation of a scene alike remarkable to me for its novelty and its dreariness.

The flames rose brilliantly, the sleeping figures of the men were covered with snow, the wind whistled wildly through the trees, whose majestic forms overshadowed us on every side, and our fire, while it shed the light of day on the immediately surrounding objects, diffused a deeper gloom over the farther recesses of the forest.

Column for the Boys.

My Dear Little Boys—You will recollect that when you were one day lately reading the Proverbs of Solomon in the Bible, you came to the passage, "Go to the ant, thou sluggard; consider her ways, and be wise." Now, perhaps you were not exactly aware of the full meaning of this expressive phrase, and so I shall tell you. It is one of those excellent admonitions of which the Bible abounds, directing persons of slothful or indolent habits to study the singular economy of ants, a small kind of insects, whose industry and ingenuity are beyond all measure remarkable, and, therefore, calculated to put even human beings to shame. But you will probably say, how can I study the ways of the ant? I live in a house in the midst of a great town, where there are no ants to be seen; and I have no money to buy the books which would describe them to me. This is very true; and so to supply these deficiencies, I shall devote a column of my Journal—which your papa gets, and which I know you are fond of reading—to tell you something of these funny little creatures, the ants.

There are many different varieties and species of ants, generally taking their names from their colour and peculiar habits—as the brown ant, the mason ant, the white ant, the carpenter ant, &c.; they also differ in size, the largest and the most extraordinary in character being found in Africa and other warm climates. The principal feature in the character of ants is their living in societies or communities. In this respect they resemble bees, who cannot live alone like spiders, and many other insects. In examining the communities of the white ant, it is found that they each consist of at least four different descriptions of inhabitants, each of which has its own peculiar duties to perform. The most numerous class is that of workers, who build and repair the nests or houses, forage for provisions, and attend on the eggs and the young. These workers are neither male nor female, but rather inclining to the character of females. The next class are soldiers, who are distinctly of neither sex. They are much larger than the workers, and are furnished with a pair of claws or mandibles, like two sharp little awls, projected from the head, and capable of inflicting a deadly wound. These soldiers do not work; and if they wanted the assistance of the workers, which supply them with food, they would soon starve. Their duty is to fight on all occasions that the community is in danger of attack; to go out on warlike expeditions; to stand as sentinels at the doors of the houses; in short, they are the guardians of the other classes who cannot fight for themselves. The other classes are the males and the females; but it is said that there is only one mother in the whole community, and that, like the queen bee, she is treated with a vast deal of respect and attention. As soon as she lays the eggs, the workers carry them off to nurseries, where they are hatched. It is observed by naturalists, that in these ant communities no part of the population exerts any authority over the rest. The soldiers do not tyrannize over the workers, nor show any insolence in their gait over those who furnish the food and lodgings; neither do the workers presume upon their utility as labourers; while the queen ant is quite passive among the rest. By the most unerring instinct, each of these little creatures knows its own duties, and performs them. The only idlers are the males; and as they will not work, they are generally left to starve soon after they are hatched. We are told that nothing can exceed the affection of ants towards their common mother, the queen. In whatever apartment in the nest she chooses to be present, a general gladness prevails, expressed by acts of joy and exultation. The ants have a peculiar way of skipping, leaping, and standing upon their hind legs, and prancing with the others. These frolics they make use of, both to congratulate each other when they meet, and to show their regard for the queen. Some of them gently walk over her; others dance round her; and all endeavour to exert their loyalty and attachment. She is generally encircled with a cluster of attendants, who, if you separate them from her, soon collect themselves into a body, and enclose her in the midst. She is never for a moment left without attendants in her apartment; and when she dies, her faithful children crowd around her, licking her body continually, either in token of lasting affection, or from the hope of bringing her again to life.

Ants, according to their natures, build their nests or houses on the ground, under turfs or stones, or on a tree; or erect huge structures above the surface of the earth, composed of particles of sand and dust, which they carry in their mouths to the required spot. In these ant houses, there are different sized rooms, piled, story above story, communicating with long galleries or passages, the ceilings being supported by pillars or thin walls, as may be necessary to support the weight above. It is told of the brown ant, which is an exceedingly industrious insect, that it forms its nest of stories, four or five lines in height. The partitions are not more than half a line in thickness; and the substance of which they are composed is so finely grained, that the inner walls present one smooth unbroken surface. These stories are not horizontal; they lie in a sloping direction. They are also arranged on no regular plan, but are suited to circumstances. It has been noticed that ants are incessant in their labours. They do not seem to require sleep, and work as well during the night, or in darkness, as in the light of day. In working at the building or repairing of their houses, they use their antennæ—that is, a small projecting point from their head, which serves the purpose of a hand for feeling or touching any thing. After placing the particles of earth in their proper position, they press them lightly down with their fore-feet, which thus answer the purpose of a hammer. As there are thousands engaged at once in these occupations, the labour is not severe upon any individual; while the walls and stories are raised with amazing quickness. Dampier, a celebrated English navigator, in speaking of the yellow ant of South America, says, they construct their nests of green leaves upon trees, placed on the trunk between the limbs, and that some of these nests are as big as a hogshead. In the dry season, when they leave their nests, they swarm all over the woodlands. They go out light, but bring home heavy loads of leaves on their backs. Other sorts of ants excavate nests for their abode in the branches of trees, and this they do with no small ingenuity. Some exercise the art of mining or boring wood to a wonderful extent. They will penetrate beneath the foundations of houses—which in warm climates are often composed principally of wood—and cut their way so far as to render every beam, rafter, and deal in the house, a mere shell; so that the houses so affected sometimes tumble down on the inhabitants. Most of these foreign ants are exceedingly voracious; they are called by naturalists the scavengers of creation, for they clear the fields and woods of all fallen timber, which would choke vegetation, as well as the dead bodies of every animal that fall in their way. They also destroy noxious and loathsome insects, such as beetles and cockroaches, by which means they are really useful to man. In some parts of Asia and Africa, the nests of ants have been seen to rise as high as six feet from the ground, and, if meddled with by passers by, the soldier ants sally out in myriads to attack their enemy, which they instantly put to flight.

We are farther informed by naturalists, that some descriptions of ants are remarkable for the wars which they wage against each other. Here is Huber's account of these destructive enterprises:—"If," says he, "we are desirous of beholding regular armies wage war in all its forms, we must visit the forests in which the wood-ant establishes its dominion over every insect within the neighbourhood of the colony. We shall there see populous and rival cities, and regular military roads diverging from the ant-hill like so many rays from a centre, frequented by an immense number of combatants of the same species, for they are naturally enemies, and jealous of any encroachment upon the territory which surrounds their capitals. I have witnessed in these forests the inhabitants of two large ant-hills engaged in spirited combat; two empires could not have brought into the field a more numerous or more determined body of combatants. The rival cities were situated about a hundred paces from each other, and alike in extent of population: what occasioned their discord I cannot pretend to say.

Let us figure to ourselves this prodigious crowd of insects covering the ground lying between these two ant-hills, and occupying a space of two feet in breadth. Both armies met at half-way from their respective habitations, and there the battle commenced. Thousands of ants took their station upon the highest ground, and fought in pairs, keeping firm hold of their antagonists by their mandibles: a considerable number were engaged in the attack, and leading away prisoners. The latter made several ineffectual attempts at escape, as if aware that, upon their arrival at the camp, they would experience a cruel death. The scene of warfare occupied a space of about three feet square; a penetrating odour exhaled from all sides; numbers of dead ants were seen covered with venom. The ants, composing groups and chains, laid hold of each other's legs and pincers, and dragged their antagonists on the ground. These groups formed successively. The fight usually commenced between two ants, who seized each other by the mandibles, and raised themselves upon their hind-legs, to allow of their bringing their abdomen forward, and spurting the venom upon their adversary. They were often so closely wedged together, that they fell upon their sides, and fought a long time in that situation in the dust, till a third came to decide the contest. It more commonly happened that both ants received assistance at the same time, when the whole four, keeping firm hold of a foot or antennæ, made ineffectual attempts to win the battle. In this way they sometimes formed groups of six, eight, or ten, firmly locked together, the group being only broken when several warriors from the same republic advanced at the same time, and compelled the enchained insects to let go their hold, and then the single combats were renewed. On the approach of night, each party retired gradually to their own city.

Next morning, before dawn, the combatants returned to the field of battle, the groups again formed, the carnage recommenced with greater fury than on the preceding evening, and the scene of combat occupied a space of six feet in length by two in breadth. The event remained for a long time doubtful; but about mid-day the contending armies had removed to the distance of a dozen feet from one of the cities, whence I conclude some ground had been gained. The ants fought so desperately, that they did not even perceive my presence; for though I remained close to the combatants, not one of them attempted to climb my legs, seeming to be wholly absorbed in the object of finding an enemy to wrestle with. During this furious warfare, the common operations of the two colonies were not suspended, for the paths, which led to a distance in the forest, were as much thronged as in time of peace, and all around the ant-hill order and tranquillity prevailed. On that side alone where the battle raged were seen crowds of the colonists running to and fro, some to join the army, and some to escort the prisoners. This war terminated without any disastrous results to the two republics. In fact, it appeared that its duration was shortened by long-continued rains, which compelled each of the belligerents to keep within their walls, and the warriors ceased to frequent the road which led to the camp of the enemy."

Another remarkable characteristic of some descriptions of ants, is, their expeditions to capture slaves. A colony wants workers, and a plan is followed of stealing away the unhatched working ants of other communities. Huber thus describes these predatory incursions:—"On the 17th of June 1804, whilst walking in the environs of Geneva, between four and five in the evening, I observed, close at my feet, traversing the road, a column of legionary ants. They moved with considerable rapidity, and occupied a space of from eight to ten inches in length, by three or four in breadth. Quitting the road in a few minutes, they passed a thick hedge, and entered a meadow, where I followed them, and observed them winding along the grass without straggling, their column remaining unbroken, in spite of the obstructions in their way. They soon approached a nest inhabited by a colony of those called negro-ants, the dome of which rose above the grass, at a distance of twenty feet from the hedge. Some of the negroes were guarding the entrance, but, on the discovery of an approaching army, darted forth upon the advancing legion. The alarm instantly spread into the interior, whence their companions rushed forth in multitudes to defend their homes. The legionaries, the bulk of whose army lay only at the distance of two paces, quickened their march; and when they arrived at the hill, the whole battalion fell furiously upon the negroes, who, after an obstinate, though brief conflict, fled to their subterranean galleries. The legionaries now ascended the dome, collected in crowds on the summit, and taking possession of the principal avenues, left some of their companions to excavate other openings in the exterior walls. They soon effected this, and through the breach the remainder of the army made their entrance, but in about three or four minutes afterwards issued forth again, each carrying off a pupa or a grub, with which booty they retraced their route, in a straggling, irregular march, very different from the close orderly array they had before exhibited."

The negro ants, from their pacific disposition, seem generally to be the victims of these hostile excursions, though Huber found that other and more courageous ants were similarly attacked. He also remarked that the invaders never carried off old ants, probably from the difficulty of taming them down to the condition of slaves. They take only those in an imperfectly-developed state, before any attachment has been formed to their native place or their kindred, and, coming into existence in the dwellings of those who carried them into captivity, they naturally look upon it as their home. Developed in the enemy's encampment, they afterwards become house-stewards and auxiliaries to the tribe with which they are associated. Brought up in a strange nation, not only do they live socially with their captors, but bestow the greatest care on their eggs and their young, going in search of provisions for them, building their habitation, and fulfilling other duties, apparently not once suspecting that they live with those very insects which kidnapped them in their helpless and unconscious infancy. Their servitude is, moreover, no source of misery to the slaves themselves. They are naturally fond of working, and their condition is not different from what it would have been had they never been captured.

Such are a few of the characteristics of ants, whose general economy, and unremitting labours, ought to furnish you with a subject of agreeable and profitable meditation. In this little creature, which is usually not half the size of a common pea, you see the most extraordinary instances of instinctive intelligence, rivalling in some measure the boasted wisdom of mankind. You will now, therefore, judge whether Solomon had not reason to remind us of our duties, by the admonition, "Go to the ant, thou sluggard; consider her ways, and be wise."

No. 93. SATURDAY, NOVEMBER 9, 1833. PRICE THREE HALFPENCE.

HOUSE-MONEY.

THE surprise with which Goldsmith's club learns that the reckoning is drunk out, will be fresh in the memory of almost all our readers. "Drunk out!" cried they all; "impossible!" The landlord, they thought, must be mistaken; or he must be cheating them; or there must have been a sudden rise in the price of liquors; or there must be some other mystery in the case, to account for so sudden an evanishment of all the sixpences originally deposited to defray the charges of their festivity. And yet the landlord was correct and honest, liquor was as it had been, and there was no mystery in the matter, but, simply, that people drink a great deal faster, when a few meet together, than they are apt to imagine. So it is with that wonderful thing, called "House-money;" a thing that "mocks married men," if ever any thing mocked them—a thing of the most illusory and unascertainable character; a thing bottomless; an abyss. House-money, in the general acceptation of the word, is that sum which men in the middle ranks of life are accustomed to disburse weekly or monthly, for the discharge of their household expenses during an ensuing space of time, and which is generally administered by the sage head and fair hands of the individual called the Lady of the House. A husband may have paid this sum for twenty or thirty years—for it must be paid—and yet the thing will be as great a mystery to him at the end as at the beginning. It goes away from his hands, like the arrow of the Arabian prince, which was carried on and on by genii, and never was found again on earth: it passes from him, and he sees it no more: on Saturday he looked, and it was there—snug in the bottom of his pocket—but on Monday, when he looked again, the place knew it not; it had vanished for ever. What is the strangest thing of all, he never becomes in the least degree reconciled to the wonder. Instead of tamely sitting down, and saying to himself, "Well, I fairly give up the question of house-money—it is a mystery beyond me, and I only misspend time in thinking of it," he is perpetually starting up, during the course of some half century of married life, with the vain inquiry, "But, my dear, where *does* all that money go? 'Pon my honour, I don't understand how so much should be required to keep our small family. Are you satisfied, yourself, that all is quite right, that there is no buttery-spirit secretly devouring our substance,* no strange error in your reckonings, no unheard-of overcharges in these pass-books I see flying about like evil spirits? I really wish you would see after it." Mrs Balderstone, who has had the same questions asked of her once every month for the last ten, twenty, thirty, or forty years, immediately takes fire at what she conceives to be an indirect charge against her housekeeping, and opens thus: "I really wonder, Mr Balderstone, that you will always be thus accusing me of extravagance. How often have I assured you that I am just as economical as I possibly can be. In fact, it is wonderful how I can make the money go so far as I do; and if it were not I am so *excessively careful*, it would be quite impossible. You can have no idea of the number of things required for a house, and how they mount up even in a weekly account. There's tea and sugar, butcher-meat and bread—tremendous articles! We consume no fewer than nine quarter loaves a-week. [Here Mr Balderstone raises his eye-brows in perfect astonishment.] And then there is beer and porter, and wines and spirits—all to be had, for you know you won't do without something of the kind every night. [Here the gentleman winces a little.] And coal—the single article of coal is dreadful." "Only in winter," interjects Mr Balderstone, glad to get a little flaw in his wife's argument. "Yes," resumes she, "but if I were not to *lay by* in summer, I never could stand the expense of this article in winter."

"Still," says Mr Balderstone, doggedly, "I cannot see how all these articles, even allowing the great quantity we use, and their high prices, should require such a *very* large sum as that which you get from me weekly, under the denomination of house-money."

"But do you think *these* are all? I wish they were. It is the *little things* that mount up—things that you have no idea of at all, but which, nevertheless, are as indispensable as any of the larger articles. If you only knew what a vast quantity of these we require, you would never call in question the way I lay out my money. There's soap, for instance, if that can be called a little article. We do not use less than two pounds every week of even the commonest kind. And there's pearl ashes—I lay out threepence every fortnight on that article—even although we have to give out most of our washing, for you know you won't let me have that additional servant I have been so long wanting, and of course we can't get every thing of that kind done at home. [Another dreadful wince on the part of the gentleman.] And there's *such* a sum every week for vegetables—things *I* don't care for, but you know *you* won't want them, and of course they are to be got. And pepper, and vinegar, and pickles, and salt—a shilling a-month for salt alone. In fact, it is quite endless, and my hand is never out of my pocket from one week's end to the other. You can't think"——

"Yet still," interrupts Mr Balderstone (for there is no convincing him of a truth so abstract), "big things, and little things, and all kinds of things considered, still I wonder how so much money should be requisite. For my own part, I eat very temperately; my glass of punch at night is my only indulgence. You eat and drink still more sparingly. We keep very little company—only a *few friends* now and then. Our family, too, is small, and children do with very plain food, poor things" ——

"Yes, yes," strikes in Mrs Balderstone in her turn, "all very true; but if you only knew how much these little creatures devour! They eat everlastingly, and a quartern loaf is nothing to them. There's little William—he takes five regular meals in the day, besides crusts in the intervals, and still you would think he is never satisfied. The dear pets have to grow off it: ah, you surely would not grudge your darlings their food [this, as the musicians say, *con exprezzione*]; and, now I think of it, what sums I have to pay every now and then for articles of clothing to them! To be sure, we run an account for the principal things. But, then, there is such a quantity of trifles besides, all of which I have to buy out of my money. Flannel shifts, stockings, tapes, thread for mending, and a *thousand* little things, that I never think of troubling you about. If I were to be strict, as I *ought* to be, I would have payment for all these items besides; but I am so anxious to be economical, that I have never yet said a word about it. This, it appears, is all the thanks I am to get. Really, Mr Balderstone, these suspicious inquiries of yours are very ungenerous."

The altercation now ceases. Mrs Balderstone's eloquent explanations have not left her husband a single leg to stand upon; yet he is only silent, from despair of making any thing of the discussion. He remains as wonderstruck as ever as to the nature and application of house-money, and some three months after, when the recollection of the debate is a little worn out, up perks the eternal subject once more, and all the same explanations are elicited from the lady, rendering the darkness only deeper, and the mystery only a little more profound. Mr and Mrs Balderstone perhaps live together fifty-five years and eight months, when at length the gentleman dies at a very advanced age, full of all kinds of knowledge and information—perhaps highly distinguished for his proficiency in several branches of science—but with regard to house-money, quite as ignorant, and fretful, and suspicious, as he was in the first year of his connubial condition.

* A superstition of our forefathers, which represented a gluttonous fiend as haunting larders, and fattening himself up, without, in general, being visible to mortal eyes. Sir Walter Scott somewhere tells a story of a buttery-spirit surprised at its morning meal in the pantry of an innkeeper.

THE LAND OF BURNS.

THIRD ARTICLE.

IT will be recollected, that, in the second article under this title, we glanced at that part of the vale of Ayr which includes the village of Tarbolton and its vicinity. Tarbolton was the village nearest to Burns's residence, when he lived with his father and brother upon the farm of Lochlee—that is, between the seventeenth and twenty-fifth years of his life. He removed at the latter period to the farm of Mossgiel, which he occupied with his brother in partnership, till his twenty-eighth year; and here it was that he composed the best of his poems. Mauchline, from which Mossgiel is about a mile distant, now became what Tarbolton had been to him before—the place where he chiefly enjoyed society, and whose inhabitants became the subjects of his muse.

Mauchline is a parish-town of above a thousand inhabitants, in ancient times the seat of a priory belonging to Melrose, but now differing in no respect from a common agricultural village. It is situated upon a slope ascending from the margin of the Ayr, from which it is about two miles distant. One might at first suppose that a rustic population like that of Mauchline would form but a poor field for the descriptive and satirical genius of Burns. It is wonderful, however, how variously original many of the inhabitants of the most ordinary Scotch village will contrive to be. Human nature may be studied every where; and perhaps it nowhere assumes so many strikingly distinct forms as in a small cluster of men, such as is to be found in a town of a thousand inhabitants. In such a place, every individual luxuriates in his own particular direction, till the whole become as well individualised as the objects of inanimate nature; while in a city, the individual is lost in the mass, and no one is greatly different from another. In a small town, the character of every man is well known, so that every thing he says or does appears to his fellows as characteristic. One is a wag, another is a miser, a third exaggerates all that he has to relate, a fourth delights (but this perhaps is little distinction) in strong waters. Every one is more or less a humorist, and, as such, affords a perpetual amusement to his compeers. If Shakspeare could draw lively delineations of human character from such persons as the originals of Silence and Shallow, it may well be conceived that a genius like Burns must have seen as good subjects in many of the villagers of Mauchline. To give an idea of the taste for wit and humour which might exist in such a scene as this, we may quote what was said by a shopkeeper named D—, when on his deathbed, in reference to a person who had been to him and all the other inhabitants as the very sun and soul of fun for many years, and was recently deceased. Even in this melancholy condition, D— said he accounted it no small consolation to reflect, that he had *lived in the same days with John Weir*. The mind of the honest trader might no doubt have been filled with more

fitting reflections at such a time; but it is impossible to doubt that it was from such escapes of national character that the very happiest touches of both Shakspeare and Burns were derived.

Mauchline was the scene of the poem entitled the Holy Fair, which, as is well known, describes the strange mixture of devotion and festivity that used to be observable at a country celebration of the communion in Scotland. The scene more immediately described was the preaching which took place in the churchyard, during the performance of the more solemn service within the house of worship. In front of a tent erected as a pulpit for the clergyman, sat a multitude of people, including many strangers,

> —— Some thinkin' on their sins,
> And some upon their claes—

as the satirical bard describes them. The parish church of Burns's time—a long low ungainly building—has recently been replaced by a smart Gothic edifice; but the rest of the scene is the same. The stranger still sees "the Cowgate," through which Common Sense made his escape, at the appearance of a particular clergyman on the preaching scene. [This, by the way, was not meant figuratively, but referred to the poet's friend Dr Mackenzie, who had corresponded with him under that assumed name.] He may also still see Nanse Tinnock's change-house, which used to fill, during the intervals of preaching, with "yill-caup commentators." This house adjoins to the churchyard, and has a back-door leading into that area—so that it must have been particularly convenient for such of the congregation as desired a solacement of drink and victuals. Nanse is long deceased, and no one has caught up her mantle. She is described as having been a true *ale-wife*, in the proverbial sense of the word—close, discreet, civil, and no tale-teller. When any neighbouring wife came, asking if *her John* was here, "Oh no," Nanse would reply, shaking money in her pocket as she spoke, "he's no here," implying to the querist that the husband was not in the house, while she meant to herself that he was not among her half-pence—thus keeping the word of promise to the ear, but breaking it to the hope. Her house was one of two stories, and has a front towards the street, by which Burns must have entered Mauchline from Mossgiel. The date over the door is 1744. It is remembered, however, that Nanse never could understand how the poet should have talked of enjoying himself in her house "nine times a-week." "The *lad*," she said, "hardly ever drank three half-mutchkins under her roof in his life." Nanse, probably, had never heard of the *poetical* licence. In truth, Nanse's hostelry was not the only one in Mauchline which Burns resorted to: a rather better-looking house, at the opening of the Cowgate, kept by a person named John Dove, and then and still bearing the arms of Sir John Whiteford of Ballochmyle, was also a haunt of the poet, having this high recommendation, that its back windows surveyed those of the house in which his "Jean" resided—now occupied by a druggist. The reader will recollect a droll epitaph on John Dove, in which the honest landlord's religion is made out to be a mere comparative appreciation of his various liquors.

The first person of respectable rank and good education who took any notice of Burns, was Mr Gavin Hamilton, writer in Mauchline, from whom he took his farm of Mossgiel upon a sublease. Mr Hamilton lived in what is still called the Castle of Mauchline, namely, a half-fortified old mansion near the church, forming the only remains of the ancient priory. He was the son of a gentleman who had practised the same profession in the same place,* and was in every respect a most estimable member of society—generous, affable, and humane. Unfortunately his religious practice did not square with the notions of the then minister of Mauchline, the "Daddy Auld" of Burns's Poems, who, in 1785, is found in the session-records to have summoned him for rebuke, on the four following charges:—1. Unnecessary absence from church, for five consecutive Sundays (apparently the result of some dispute about a poor's rate); 2. Setting out on a journey to Carrick on a Sunday; 3. Habitual, if not total neglect of family worship; 4. Writing an abusive letter to the session in reference to some of their former proceedings respecting him. Strange though this prosecution may seem, it was strictly accordant with the right assumed by clergymen at that period to inquire into the private habits of parishioners; and as it is universally allowed that Mr Auld's designs in the matter were purely religious, it is impossible to speak of it disrespectfully. It was unfortunately, however, mixed up with some personal motives in the members of the session, which were so apparent to the Presbytery, to which Mr Hamilton appealed, that that reverend body ordered the proceedings to be stopped, and all notice of them expunged from the records. Prepossessions of more kinds than one induced Burns to let loose his irreverent muse in satire against the persecutors of Mr Hamilton; and the result was several poems, in which it is but too apparent that religion itself suffers in common with those whom he holds up as abusing it. About two years after, when Burns had commenced the Edinburgh chapter of his life, a new offence was committed by Mr Hamilton. He had, on a Sunday morning, ordered a servant to take in some potatoes which happened to have been left out in the garden after being dug. This came to the ears of the minister, and Mr Hamilton was summoned to answer for the offence. Some ludicrous details occur in the session-records. It is there alleged that two and a half rows of potatoes were dug on the morning in question, by Mr Hamilton's express order, and carried home by his daughter: nay, so keen had the spirit of persecution been, that the rows had been formally measured, and found to be each eleven feet long; so that twenty-seven feet and a half altogether had been dug. The Presbytery or Synod treated this prosecution in the same way as the former, and Burns did not overlook it in his poems. He alludes to it in Holy Willie's Prayer, when he makes that individual implore a curse upon Mr Hamilton's

> —— basket and his store,
> Kail and *potatoes*—

and on several other occasions.

In Mr Hamilton's house, which is occupied by his son, Mr Alexander Hamilton, in the same line of business, is shown the room in which Burns composed the satirical poem entitled the Calf. He had called upon Mr Hamilton on his way to church, and being desired by that gentleman to bring home a note of the text, produced on his return those clever but certainly over-severe and wicked verses. Mr Hamilton's writing-room had then a back-door leading to the church. By this way Burns entered, and finding Mrs Hamilton writing a note at her husband's business-desk, requested a pen, and, sitting down on the other side, scribbled in a few minutes one of the most bitter *jeux d'esprits* he ever penned. This room is further remarkable as the one in which the poet was married, that ceremony being rather of a legal than of a religious complexion. From the session-record, it would appear that the ceremony took place on the 3d of August 1788, and that Mr Burns, being informed that in irregular marriages it was customary for the bridegroom to pay a small fine to the poor of the parish, gave a guinea for this purpose.

Mossgiel, or Mossgavel, as already mentioned, is about a mile from Mauchline. It is a very plain *farmsteading*, of the kind described in Ramsay's Gentle Shepherd—

> A snug thack house, before the door a green;
> Hens on the midden, ducks in dubs are seen;
> On this side stands a barn, on that a byre;
> A peat-stack joins, and forms a rural square—

except that the buildings are not thatched. Being situated at the height of the country between the vales of Ayr and Irvine, it has a peculiarly bleak and exposed appearance, which is but imperfectly obviated by a very tall hedge and some well-grown trees, which gather around it, and beneath one of which the poet is said to have loved to recline. The domestic accommodations consist of little more than a butt and a ben—that is, a kitchen and a small room. The latter, though in every respect most humble, and partly occupied by fixed beds, does not appear uncomfortable. Every consideration, however, in the mind of the visitor, sinks beneath the one intense feeling that here, within these four walls, warmed at this little fireplace, and lighted by this little window, lived one of the most extraordinary men that ever breathed; here wrote some of the most celebrated poems of modern times. The place has one touching recollection above all others—that it was the scene described in the opening of his beautiful "Vision."

> There lanely, by the ingle-cheek,
> I sat and eyed the spewing reek.
> * * *
> All in this mottie misty clime
> I backward mused on wasted time,
> How I had spent my youthfu' prime,
> And done nae-thing,
> But stringing blathers up in rhyme,
> For fools to sing—&c.

The house is in every respect exactly in the same condition as when the poet lived in it. It was occupied by his brother Gilbert down to the year 1800, and since then has had but one tenant, the individual who now occupies it. It may be mentioned that a part of the farm bears the title of Knockhaspie's Lands, which, it will be recollected, he alludes to in one of his songs—

> I wad gi'e a' Knockhaspie's Lands
> For Highland Harry back again.

We must now take a glance at the romantic scenery of the Ayr, to which allusion was so frequently made in the preceding article. The beautiful grounds around Barskimming House are the first in order after Coilsfield; this, in Burns's time, was the seat of Lord Justice Clerk Miller, and now of his son, Lord Glenlee. It is alluded to by the poet in the Vision—

> Through many a wild romantic grove,
> Near many a hermit-fancied cove,
> (Fit haunts for friendship or for love,
> In musing mood),
> An aged judge, I saw him rove,
> Dispensing good.

The river passes through this lovely park by a chasm in general upwards of a hundred feet deep, and the sides of which are almost every where as steep as the walls of a house. Here and there is seen a profound section of rock, perforated in some places by what Burns aptly terms hermit-fancied coves, and in all cases whiskered by the most luxuriant foliage. There is a bridge near the house, where the scenery is enjoyed in high perfection. Both upwards and downwards, nothing is to be seen but tremendous banks of wood, or great scalped rocks, beneath which the river passes moodily onward, dark as Cocytus, except where mottled with the foam of a recent conflict with some rude opposing crag.

Farther up the river is Kinzeancleuch, now a place of no note, but which will not be passed by any one interested in the history of our national church, without some pleasing and respectful reminiscences. Campbell of Kinzeancleuch was one of the first of the Scottish barons who espoused the Reformation—was the steady friend and protector of Knox—and was present at his death. The Reformer himself was oftener than once sheltered at Kinzeancleuch House. It is remarkable that Burns appears to have either been acquainted with no part of Scottish history except that of Wallace and Bruce, or to have had no sympathies for any other portion of it. At Mauchline there is a martyr's stone, to which he has never made the least allusion.

Immediately above Kinzeancleuch, commence the Braes of Ballochmyle, which he has commemorated in one of the most glowing of all his amatory songs. Ballochmyle was formerly the property of Sir John Whiteford, representative of the gentleman whose story supplied the groundwork of the novel of Waverley, but in Burns's time was purchased by a mercantile family named Alexander, connected with Glasgow. The scenery is much the same as that of Barskimming, except that the banks of the river are softer, and break into fine dens and glades, which are comparatively unknown farther down the stream. Amidst these romantic groves, Burns was wandering on a summer evening, when he passed a young lady, daughter to the new proprietor, with whose charms he was greatly struck. The result was his beautiful song, entitled, "The Bonny Lass of Ballochmyle," which he sent to her, enclosed in a very respectful letter. To his great mortification, no notice was taken of the communication. The young lady in all probability felt more resentment at the freedom, than pleasure from the compliment. However this may be, it is certain that, in subsequent years, when the fame of the bard overspread many lands, Miss Alexander began to appreciate the poem more than she had done. In some revolutions of the family household, when she was about to remove to Glasgow, it became a question whether the original of that document belonged to the family, and should remain at Ballochmyle. "That," said she emphatically, "is with me a settled point: wherever I go, the poem shall go with me." She permitted a copy, however, to be taken by the apograph of a neighbouring artist,* on wood; which is fixed into the back of a moss-house amidst the braes of Ballochmyle. The lady is still alive, and unmarried.

THE CONFESSIONS OF A DRUNKARD,

A TALE.

I WAS born in one of the states south of the Potomac, and am the only son of an opulent family, claiming some little distinction from two or three generations of gentility. I will not mention its name; I have disgraced it enough already. We lived in the country, in a populous neighbourhood, and here I remained at home, receiving from my parents, as well as my sisters, those mistaken indulgences which so often have a fatal influence over the destinies of only sons. I learned to think myself always in the right, because in all disputes or conflicts with my sisters they were obliged to yield: fancied myself a man at fourteen, because I was allowed to have my own way; and a prodigy of genius, because I was altogether unaware of the extent of my ignorance. I do not recollect that at this time I felt any propensity to the vice which has been fatal to myself and to all those whom the ties of existence had gathered around me. I only know that I was allowed to mix occasionally, and indeed as often as I pleased, with those of the country people, whose examples, if they operated on me at all, could only do me harm. I went to all the frolics in the neighbourhood, good, bad, and indifferent, where the country lads do many things, which, though not perhaps unbecoming in persons of their class and habits, cannot be indulged in by persons of mine, for any length of time, without more or less injury to that delicacy of feeling, those proprieties of manner, and those nice, sensitive principles, which constitute the distinctions of a gentleman. Young men destined to move in that sphere of life which places them above the necessity of employment, cannot be too careful of their company and amusements, since by associating with vulgar idlers, they almost invariably approximate themselves to their level, adopt their manners, acquire a taste for their amusements, and only sink

---

* Mr Lockhart, in his Life of Burns, both editions, has given a somewhat incorrect account of Mr Hamilton, his family, and the causes of his quarrel with the kirk-session of Mauchline. His father was a son of Hamilton of Kype in Lanarkshire, and it was only by his wife that he was in any way connected with the district of Carrick; she being a daughter of Kennedy of Daljerrock. It is related of the laird of Kype that he was once paying a visit to the Duke of Hamilton, when his grace inquired in what degree he was related to the ducal house, and whereabouts in the family tree the race of Kype was to be found. "It would be needless to seek the root among the branches," answered the haughty laird, who perhaps had some pretensions to be of the principal stock of the Hamiltons, or knew at least that the claims of the ducal house to the chiefship were by no means clear.

* This artist is Mr Andrew Smith, of W. and A. Smith, Mauchline: one of those ingenious individuals who are sometimes found in the most retired and rustic situations. Mr Smith is the inventor of the instrument above alluded to, one calculated to be eminently useful in taking fac-similes of any piece of writing, or other work consisting of lines, and that in any degree of amplification or reduction. In company with his brother, he conducts a manufactory of wooden snuff-boxes, upon a considerable scale, about sixty people being employed; and the quantity of ingenious machinery which he has brought to bear upon this humble but curious and even elegant manufacture, is such as would impress any stranger with surprise.

the lower, from the height of their descent. One of the lowest, the meanest, and most depraved of mankind, is the man of education, refinement, and accomplishments, transmuted into a low and dissipated blackguard. The impulse which carries him over the barriers of habit, education, and example, which impels him to overleap the gulf that separates him from vulgar vice, cannot, without a miracle, stop short of perdition.

With the view of finishing my education, I proceeded to college at the age of sixteen. The college was situated in the centre of a great city; and great cities, as many people believe, are the most dangerous places for young men. Certainly, this proved so to me. My inclinations soon led me into the company of the most idle and dissipated young men of the place. I now lost my money; I lost my rest; my character among my equals; my station in society; above all, I lost for ever all those delicious feelings, those innocent sources of pleasure, those aspiring hopes and anticipations, and that ambition which animates youth to reach at things above, instead of stooping to things below them.

What would my poor father and mother have said and thought, had they seen me emerging, at the dawn of day, from an obscure den, haggard with want of rest, or red in the face with the liquor I had swallowed in the course of the night? But they died without even suspecting my swift deterioration, or anticipating the disgrace I was to bring upon their name. It may be supposed that these courses incapacitated me for my college exercises. I began to descend, and at every examination approached nearer and nearer to the tail of my class. The better sort of lads drew off from my society; the professors cautioned, lectured, and threatened in vain. From the foot of the second I was degraded into the lowest class, from which I was at length expelled, for reiterated instances of negligence and impertinence.

Notwithstanding the life I led, I was not altogether debased. It is not all at once that the soul is stripped of its regalia. It is by little and little that it is cast away; although to the world it appears, perhaps, that the wretched delinquent has made but one step to the consummation of his follies and his crimes. I still preserved the exterior and the manners of a gentleman; and, in the day-time at least, associated with men and women far better than myself. My habits had not so far changed me from what I was, that either my relatives or friends had turned their backs upon me. I still cherished a liking for books, at times; read sometimes the whole of a rainy day; visited young ladies occasionally; and was reckoned by their mammas not altogether unworthy of an invitation to a tea-party. Above all, I had not actually committed any overt act, such as is, or ought to be, followed by the loss of *caste*. I had, it is true, a habit of taking brandy and water, at times; but I felt no want of it as a stimulant, and the habit was by no means confirmed. In short, when I came of age, and took possession of a handsome estate, I might still, if I would, have taken the place in society for which my fortune and connections seemed to have destined me. But my evil genius, or rather my evil habits and passions, were at length to have their final and complete triumph.

My next stage of declension was associating myself with a club of those worthless gamblers who usually haunt large towns. These, with the exterior of gentlemen, carried on the profession of card-playing. Every night they met for the purpose of playing at whist, and, by various schemes, had reduced it to a matter of certainty that they would win. In the course of a single year, these elegant companions contrived to strip me of all my ready money. I soon afterwards mortgaged my estate, and the proceeds in time also vanished. In fine, I became poor; and one hot summer's day, it came into my mind to visit my sisters, who lived on a part of my father's estate in the country, in peace and innocence; doting on me as an only brother—the hope of the family.

Well, I visited my sisters, who received me with an affectionate joy, that went to my heart of hearts. They admired me beyond any other human being, and they loved me still more. The sight of my early home, the kind flatteries of my sisters, and the sacred influence of quiet repose, of woods, waters, and meadows, birds, flowers, and all the full, combined harmony of nature, for a while awakened in my heart the rural feeling so nearly allied to virtue. I began by degrees to relish a stroll with my sisters along the little stream that skirted their grounds; to enjoy the moonlight, and the wandering glories overhead; and tried to take a pleasure in looking on or partaking in the merry hay-makings of the season.

While resident with my sisters, I received a letter from one of my gambling friends in town, dunning me in the most genteel manner for a couple of thousand pounds which I owed to him. I shudder while I relate the step I now took. I was the sole executor of my father's estate, and the property of my sisters had been left entirely under my control. Wretch that I was, I secretly appropriated the whole of the means of support of my confiding sisters. I mortgaged their portion of the estate, as I had done my own. On taking leave of these gentle creatures, I durst not look them in the face, as they hung around me, and kissed me with tears of pure and innocent love.

From the moment I robbed my sisters, and only from that moment, I felt myself degraded past all recovery, lost beyond redemption. Wherever I went, I bore about me this intolerable feeling of irretrievable disgrace; and to escape from it, I plunged deeper into guilt. But now comes another scene in my infamous career. Accident about this time threw me into the society of a young gentlewoman, of good family, and possessing a handsome fortune in her own right. Her person was attractive—almost beautiful, and her face shone bright in the lustre of a pair of intelligent black eyes, matched, or rather contrasted, with a fine set of white teeth. Hitherto I had never thought of marrying. The life I had led had in fact made me incapable of loving a virtuous woman as she deserves to be loved. Let no woman who values her happiness unite herself to a reformed debauchee.

Finding my society agreable to this lady, whom I shall call Amelia, the idea by degrees occurred to me, that she would be an advantageous speculation, as we used to say at the club. Her person, as I said before, was attractive, but that did not much matter; and her fortune was liberal, which mattered a great deal. She was young, romantic, and somewhat buoyant in spirits. I played the hypocrite finely. We rode out together through the beautiful landscapes of a most beautiful country, and she greeted every murmuring brook, twittering bird, and rocky glen, with a vivacity of admiration that would have called up a corresponding feeling in any heart but one like mine, labouring under a sense of degradation, combined with the lethargy of worn-out sensibilities. She had neither father nor mother living, but she had friends, who, though ignorant of the extent of my fall, still knew enough of my habits to think me unworthy of her hand. But young women who are rich, and mistress of themselves, are, I believe, not apt to be controlled by friends in the choice of a husband; and believing, as Amelia did, that they wronged me, she was only the more determined to do me right. She consented to trust me with herself, her happiness, her destiny—and we were married.

For some months I led a prodigy of a life. I neither drank nor gamed; and the connections of my wife began to give me credit for a thorough reformation. But, alas! when evil passions are within, they will come out at last. One of my sisters married, and it became necessary that her portion should be forthcoming. I had now a man to deal with, and farther deception became impossible. The crisis of my fate arrived. My generous, noble-hearted wife had peremptorily resisted all the cautions of her relatives to have her fortune settled on herself. No: she always replied, no, I trust him with my happiness, and my fortune shall go with it. It rested with me now, either to tell her candidly my situation, and throw myself on her generosity, or to make use of her fortune secretly, to replace that of my sister's. That strange pride which clings even to guilt and degradation, prompted me to the latter. To replace the money of which I robbed my sister, I robbed my wife of that which after-events proved she would have given me with all her heart.

I began to estrange myself from home, and, by degrees, to drink drams, to keep up the courage of dastardly guilt, and make me sufficiently a brute, to meet her, after my nightly orgies, without sinking into the earth. Now it was that my downhill course became more rapid than ever.

To meet my perpetual losses, I made other drafts upon my wife's fortune, and to dull the sense of infamy, I drank deeper of brandy. Sometimes I rallied the remnant of good principle that was within me, and abstained both from gambling and drinking for days and nights, sometimes weeks together; but again I was carried away by impulses and habits, only the more impetuous for their momentary restraint. My wife behaved with propriety; she kept my secret, and neither betrayed me to her friends, nor uttered a reproach. She bore all in silence.

During this period we had two children, a boy and a girl. I could not bear to look at them, from the moment their little eyes began to know me. I had injured them as well as their mother; and bad as I was, I never could bear the looks of those I had wronged. To the virtuous and happy father, these little strangers form those gentle links that bind him the closer to his home, and inspire new feelings of gratitude and goodness. But it was not so with me. I was rapidly becoming an outcast from the domestic circle; an alien from all that is good, and beautiful, and elegant. My tastes, my propensities, my habits, were now all assuming the same hue of infamy and irretrievable debasement.

The depredations I had committed on the inheritance of my children, were now brought to light by that inevitable train of events which never fails, sooner or later, to bring the villain to his reckoning. Nearly at the same time, my estate was advertised by the sheriff, on a foreclosure of the mortgage. It was thus discovered that I was a beggar when I married, and that I had since become a scoundrel. Even my unbending pride, aided by the maddening bowl, could not stand this. I could not endure the sight of those who, from having once looked up to me, now shunned me with averted eyes, or gave me only glances of cool contempt.

One day I happened to meet an old acquaintance in company with two or three gentlemen, in such a way that it was impossible for him to pretend not to see me, or for me to avoid him, without actually sneaking away. I accosted him, but he took no notice of me. 'I believe you don't know me,' said I. 'O yes, I *do* know you,' he replied, and turned on his heel. The emphasis he laid on this little word was admirably expressive. I understood it, and so did the gentlemen present. My blood boiled, and the more, for knowing I deserved this treatment. I poured forth a deluge of invectives, and provoked him at length so far to forget himself, as to knock me down. That very hour I sent him a challenge, for I was not yet sufficiently abject to put up with a blow; and though I acknowledged to my own heart that I deserved the treatment I had received, still I burned for revenge. It was in vain that the friend to whom the gentleman applied to carry his answer, represented me as unworthy of his notice, a man without any reputation to lose, and to whom a blow could add no deeper disgrace. 'I should have thought of all this before I gave the blow,' he replied. 'Having noticed him in the first instance, I have no right to say now that he is beneath my notice. I must offer either apology or atonement. I cannot descend to beg his pardon, and there is but one other alternative.'

Under the influence of these mixed principles of right and wrong, did this high-spirited young man consent to meet me. My habitual excesses had so shattered my nervous system, that nothing but copious draughts could steady my hand. I drank deep that morning; and though my vision was indistinct, my hand did not tremble. My second, one of my old club companions, who was an amateur of duelling—that is to say, in the second, not in the first person—gave me many special directions how to hold my pistol, and when to fire. But I was stupified by the time we got to the ground, and every object swam before my eyes, as if floating on the waves. I scarcely heard the words, 'one—two—three—fire.' I raised my pistol mechanically, and yet—strange and inscrutable dispensation!—my antagonist fell dead at the first fire. A mother lost her only son—an amiable and virtuous woman an affectionate husband—and three children became orphans—for the wife survived the shock but a few months. Thus, as my worthy second assured me triumphantly—thus, and at this price, had I vindicated my honour. What honour? The honour of an unnatural brother, a brutal husband, an unfeeling father, a beastly sot!

It is now time to speak of my poor wife and children. From time to time, during the progress of the scenes I have just been sketching, Amelia had been strongly urged by her friends to leave me, but she always mildly, yet peremptorily, refused. 'My lot,' would she say, 'was of my own choosing; and whatever it may be, I have made up my mind to bear it to the end.' Even this devotion did not touch my heart. On the contrary, I taunted her with her ridiculous attachment; and scarcely a day passed that I did not ask her, with gross barbarity, why she did not go to her friends. I did not want her company—not I; nay, I wished to get rid of it, and never see her face again. I found fault with her domestic economy; reproached her with not keeping her children decent; with being a slut in her own person, though she was neatness itself; with being ugly, disagreeable, stupid, tiresome, a millstone about my neck, the bane of my life, and the cause of all my misery. What will a good wife not submit to?—she bore it all.

If there ever was a lost, hopelessly, irretrievably lost being in this world, it was myself. I was dunned for money I could not pay. I was shunned by my neighbours; my servants left me, as one it was a disgrace to serve; and even the sots of the neighbourhood disdained to drink with me, because, as they said, 'a gentleman ought to be ashamed to make a beast of himself.' Though I literally lived without food, I had become a bloated mass of physical inanition. My hands shook; my face was swelled and livid. Then my mental tortures!—But they are past all description. The reader will think this was bad enough, but as yet he has seen nothing. The tragedy is still to be exhibited.

One day—it was an ominous day—the anniversary of our marriage—in a fit of savage hilarity I declared I would celebrate it with more than usual splendour. I got up at twelve the preceding night, and intoxicated myself before sunrise, when I went to bed and slept myself partly sober again before dinner. At dinner I again drank deeply. I proposed a toast—'Our wedding-day, and many happy returns of it.' A sudden pang seemed to cross my poor wife's mind, and produce a train of bitter recollections. 'Was it not a happy day, Amelia?' said I, tauntingly. She burst into tears, and covered her face with her hands for a minute; then slowly removing them, she replied, with a look of agony that still haunts me day and night, 'Yes, it was a happy day—but ——.' The tone and look irritated my already infuriated spirit. 'But what,' replied I—'Come, speak out—let us have no secrets on this happy day.' 'We have paid dearly for it,' she said—'You with the loss of fortune, fame, and goodness. I with a broken heart and a shattered reason.'

'And I alone am to blame for all this, I suppose.'

'No; I blame nothing but my own folly. I had my warnings, but they came too late, or rather, as my conscience tells me, I shut my ears to them. Would I had died,' added she, wringing her hands, 'before that miserable day!'

'You are no longer the gay, sprightly, animated, witty thing that won my heart,' said I.

'Your heart!' replied she, scornfully; 'but who was it that robbed me of my gaiety; that worried my sickened soul by night and day; that has broken my heart, and turned my brain? Do you know the man, the monster I would say?' Her eyes now flashed fire as she continued—'Do you know the monster, I say?—he who deceived my youth, wasted my fortune, destroyed my happiness, degraded the modesty of my sex and station, and heaped coals of fire on the heads of my children?—who rendered the past a recollection of horror, the present yet worse—the future—O my God!'

'*I*, whom you promised to love and obey all your life. Come, give me an example of obedience,' cried I, pouring out a glass of filthy liquor; 'come—one bumper more: I swear you shall drink one bumper more to this happy day—come!'

'I will not!'

I rose, and staggering to the other side of the table, where she was sitting, vehemently protested she should drink it.

'I will not!' she again replied.

Who shall answer for the actions of a man mad with drink! A struggle now ensued, during which I became irritated into fury. The children clung affrighted about us, but I kicked them away. My poor Amelia at length struck the glass out of my hand; I became furious as a demon, and threw her from me with a diabolical force, against the corner of the fireplace. She fell, raised herself half up, gave her children one look and me another, and sunk down again.—She was dead.

I am now the sober tenant of a madhouse. The jury that tried me would not believe a man who acted such scenes as were proved upon me, could be in his senses. They acquitted me on the score of insanity. My relatives placed me here to pass the rest of my days, and recover my senses if I can. But I am not mad. I live, in the full horrible perception of my past wickedness. I know not what is become of my children, for no one will answer my inquiries—no one will tell me where they are, or whether they are dead or alive. All I can understand is, that I shall never see them more. My constant companion day and night, waking or dreaming, is my murdered wife. Every moment of my life is spent in recalling to my mind the history of that ill-fated girl, and in summing up what I have to answer for to her, her friends, and her offspring. Denied the indulgence of all sorts of stimulants, my strength is gone; my body shrunk and shrivelled almost to a skeleton, and my limbs quake with the least exertion. Guilt grins me in the face; infamy barks at my heels; scorn points her finger at me; disease is gnawing at my vitals; death already touches me with his icy fingers; and eternity waits to swallow me up.

The man to whose charge I am committed has furnished me with the means of fulfilling this my last task, and making the only atonement in my power for what I have done. If there be any one who shall read this, to whom temptation may beckon afar off, at a distance which disguises its deformity, let him contemplate me as I entered on the stage of life; as I pursued my career forward; as I closed, or am about to close it for ever. Let him not cheat his soul; let him not for a moment believe that it is impossible for him to become as bad, nay, worse than I have been.*

THE ART OF DRAWING.

Drawing, one of the most useful of the fine arts, was once considered a faculty attainable only by a few gifted individuals; but experience has clearly shown, that, like other studies to which the mind may be properly directed, it is now to be acquired by ordinary application.

Drawing is not only a portion of polite education—it is as useful as elegant, and deserving of more extended cultivation, from the various purposes to which it may be applied. In our manufactories, all of which are more or less connected with the arts, the advantages derived from drawing have been very conspicuous. Combinations of forms and colours have been presented to the various artificers in a state of perfection that could never have been conveyed by oral or literal description. In mechanism and in the sciences, drawing is of the utmost importance; without its aid, demonstration would be impracticable.

The numerous advantages to be derived from drawing, as an occasional study, are worthy of consideration. It will enliven many a solitary hour—improve the understanding—add many a joy to the mind during the contemplation of works of nature or of art—and contribute essentially to the charm of existence. Those who have knowledge of the characters of the alphabet and their combinations, necessary to express an idea on paper, have accomplished more than is required to enable them to represent an object from nature, since this is simply an imitation of lines presented to the senses; but, while communicating to paper, by means of pen and ink, a number of characters which embody a thought, the mind exercises a wonderful capacity, in the effort of memory, respecting the forms proper to be used—the arrangement of them necessary to compose the different words—and the construction of the members of each sentence, so that all may be understood by every reader. All these complicated exertions of the mind are not called into action while copying from nature a leaf or a stone, a simple outline only being required, and the object placed before the copyist. What is there to prevent this simple form from being imitated, if there be an inclination? The correctness of the outline will depend on the facility with which a pencil may be used, unquestionably, but far more on the state of the mind. If there be a determination to accomplish a likeness of the object, it will not be denied to calm perseverance. Who ever gave the most approved form to a letter after a few trials? A little reflection will teach, that the same degree of assiduity is rewarded by similar results.

Drawing is regulated by rules that soon become familiar, and the progressive study of them never fails to excite a desire for farther information: "All is the gift of industry." The inclination to attempt more than the mind can arrange or the hand execute, is injurious to advancement. "Wisely and slow, they stumble who run fast." Those who determine to master the imaginary difficulties will succeed soonest by a careful selection of easy forms at first, proceeding gradually to others more complicated, then to a combination of objects, which cannot be too simple. A root of plantain growing near a rude stone is sufficient for a picture in the hands of an artist. Whatever may be selected for practice, let all be taken from nature. Look not to prints nor paintings for instruction, till you have accustomed both mind and hand to the imitating of the great original. You must endeavour to look at nature with your own gift of vision, and not as pretended to have been seen by other eyes. It is absolutely injurious to have the drawings of any artist placed in succession before pupils with the enforcement of imitation: it may be a style which does not please them. There is a possibility of their being enabled to see nature unfairly represented. They may detect mannerism, or they may have a dislike to copy that which excites no pleasing associations; yet this is too often a mode of proceeding by persons denominated drawing-masters; and to it is added the study of geometrical problems, with diagrams illustrative of perspective. The confusion thus created, and the apparent toil required to overcome so many difficulties, make an impression on the mind that no encouragement can remove; yet they are incited to undertake what may appear impracticable, till dislike is produced, and the study is relinquished. It is by beginning when the mind is disposed to receive instruction, that hope of success can be rationally entertained. To urge it beyond its comprehension, impedes the progress of information, or destroys the germ that would otherwise have flourished.

If drawing be considered only as an amusement, it will be found one of the most entertaining, and a source of pleasure that increases with the perseverance of the applicant. To the tourist it is of great importance; for buildings, scenes, and objects, perhaps beyond the power of language adequately to express, may be conveyed by a few lines and tints, with surprising correctness. Many travellers who have united the skill of the draughtsman to great literary acquirements, have stated that a few spirited lines are capable of conveying more information than pages of elaborate description. Perhaps the utility of drawing needs no farther confirmation, and that it will be better to give some hints respecting the means by which it may be obtained.

A sketch-book, about nine by six inches, is of a convenient size for a beginner; and whatever may be inserted should remain for reference and for evidence of advancement. A piece of good black-lead should be procured, and fixed in a port-crayon or a quill; a point to the lead may be obtained by rubbing it on a file; or a black-lead pencil, with a soft and bold point, may be used, because it is better adapted for sketching than a fine-pointed hard pencil, which impedes facility in the use, and gives a feeble or meagre line, incapable of detaching objects. A piece of good lead is readily made to a point sufficiently fine; and it is possessed of power, particularly if repetition be applied, to separate objects from each other with effect. The inconvenience arising from a distribution of lead too copious, may be obviated by always beginning on the left, and concluding on the right; the hand will then not interfere with the sketching. When finished, the page may be placed on a plate, and beer or skim milk poured on it, till the surface be equally wetted; when it has become nearly dry in the air, the book may be closed, the lead pencil lines will have become fixed, and the page smooth in a few hours.

Practising on the simplest objects presented to the eye, as before recommended, may not be deemed of sufficient consequence to find a place in the sketch-book, and, perhaps, till the eye and hand shall have become a little familiarised with sketching, the early efforts may be confined to pieces of paper, but not destroyed. They are, like the marks, the pot-hooks and hangers of all juvenile writers; the fair copy-book is opened, when a character can be formed with some approach to accuracy. Those who determine to learn drawing, taking nature for their master, must place on their memory, and adopt in their practice, three characteristic lines, which are thus distinguished from each other. *A perpendicular line* is upright, or in agreement with the sides of the sketch-book; *a horizontal line* is straight across, or in agreement with the top and base of the book; *a diagonal line* is slanting, either way, so as to be neither a horizontal nor a perpendicular. The knowledge of these three lines is indispensable at the commencement of sketching; they are of the first importance to the representing of objects with their natural appearances depending on linear perspective.—In our next number, we shall offer our young readers a series of simple instructions, to enable them to draw with neatness and satisfaction.

* Altered and abridged from a tale, published in the series of "Stories of American Life," edited by Miss Mitford. The authors' name is not mentioned.

SMALL TOWNS.

I lately visited a small country town in the north of Scotland, and was much amused by observing the various characteristics which distinguish a small mass of human population from a large one. The first peculiarity I had occasion to remark was the excessive anxiety of the natives, and particularly of the individual who acted as my cicerone, to impress a respectful notion of the town upon the mind of a stranger. In the course of our walk, this gentleman descanted, in terms truly eloquent, upon all the various useful and delightful properties of the town—its pleasant walks, its neat public buildings, its distinction for some particular manufacture—and so forth. To judge from the account of my guide, there never was such a school as that of Rickleton since the creation. Its scholars are known all over the world. An eminent Edinburgh professor visited it a few years ago, and gave the highest approbation to all its arrangements. A celebrated barrister was brought up at it. And then as to water—there never was a town like Rickleton for water. It is so pure, so agreeable to taste, and withal so plenty. In fact, the water of Rickleton is better than beer in some other places. And provisions, how cheap! Beef never above fivepence a pound, while it is sixpence in the city; and, above all things, it is to be had at least once every week! Vegetables in Rickleton are, like the air we breathe, things without price. Every body has his garden, which it is a mere amusement to cultivate, and thus grows his own leeks, cabbage, and potatoes. The same thing, in a manner, may be said of fruit. Pears, in particular—every body has heard of the Rickleton pear—are so very plenty, that the difficulty is, how to get them eaten. In one particular branch of trade, Rickleton is allowed to be unrivalled in the country—that is, in the preparation of red-herrings. "Rickleton Red-Herrings" is an inscription to be seen in all the shop windows over the country. It is an article in which the town prides itself, and whenever there is any public festivity among the inhabitants, "Success to the Red-Herring Trade of Rickleton" is the grand patriotic toast of the night. And such a fine old abbey there is in the neighbourhood of the town! Edinburgh has many fine things, but *we* beat them in the article of a fine monastic ruin. People come from far and near to see our abbey." And only look at our river—there is another thing in which we beat the Edinburgh folk—considered the second stream in the country. We have capital inns, too: the Cross Keys is as good a house as any in the country—keeps two post-chaises and a gig. The view from the window of the travellers' room is said to be almost unrivalled on this side the Grampians. And such a place it is for producing distinguished men! —— the poet, and —— the historian, and —— who is a minister in Glasgow, were born here. All owing, sir, to the capital schools. In short, it is made out, that, if respectable annuitants would come and reside in the place, they would live almost free of cost, enjoy the most delightful walks and country recreations, and have the satisfaction of becoming the fathers of almost all the eminent men of the next generation, literary, philosophical, and otherwise.

To speak more seriously, there is always to be found in small towns an intense appreciation of every thing about them that is in the least peculiar—and just the more intense in proportion to the smallness and unimportance of the place. This feeling is just an extended species of self-love, the *place that is ours* coming instead of *ourselves*. It is a feeling which may be permitted to excite in other persons a gentle merriment, but it should never be made the subject of cutting sarcasm or ridicule. The truth is, every person, whatever be the town or city of his residence, is liable to be possessed by such sentiments, and to become a subject of amusement, on account of them, to the native of a somewhat larger place. The native of a town of three thousand inhabitants, supplies, with his fondness for it, amusement to him who resides in one of five thousand; he, in his turn, to one of eight thousand; he, again, to one of twenty. The pride which a citizen of Perth, for instance, feels and expresses (and justifiably so) in his fair city, may bring a smile to the cheek of an inhabitant of Edinburgh; and the "Modern Athenian," in his turn, if he expatiates in the hearing of a Londoner respecting the highly-estimated beauties of his capital, will be treated in a manner not greatly different. It is, upon the whole, a fortunate peculiarity in human nature; for without such attachments to minor places, their in-

habitants would lead a life of perpetual discontent, or centralise into large masses, and leave the country deserted. It is to such a sentiment that we are to ascribe the fact, that there are human beings living beyond the arctic circle, as well as in the torrid and temperate zones.

Another characteristic of small towns is the aristocratical spirit which pervades the upper class of citizens. This is a conspicuous feature, and much developed. A small town may in truth be considered as an epitome or miniature picture of a large kingdom, consisting of king, lords, commons, and the populace. Here, on a small scale, each of these classes is faithfully represented, as in a reducing reflector. The provost, or chief magistrate, represents the king, and very often he displays, if not all the dignity and grace, yet fully all the pomp and pride of majesty, in his bearing towards the general mass of his subjects. To his equals, or even, it may be, superiors, in every thing but official dignity, he is courteously affable, familiar, and polite, but from all the rest of his realm he looks for abject submission, the most implicit obedience, and the profoundest homage. The provost's lady takes the tone from her husband, and affects a supremacy over her gossips, from whom she is equally rigorous in exacting obedience. Nay, even the children assume the same lofty superiority over their fellows, and the very youngest of them learns to play the kingling over his tiny subjects.

In a small town, the different grades and the distinctions of rank are formed and adhered to with almost the same pertinacity as in China itself. Here are *castes* as in India, and, without wealth, it would be nearly as difficult to step out of them. Wealth is the main basis of respectability, but there are some other necessary ingredients; such as, the family having had a long standing in the town; having been respectable citizens for several generations, and some of their forefathers having been in the magistracy. The nature of the profession, too, is of considerable consequence. *Writers* take the lead every where, and, with the medical profession, and any genteel annuitants who may happen to cluster about the town, form a class who profess to hold all the trading people at a distance. Manufacturers, in proportion to their wealth and weight of character, rank next in precedence; and to them succeed merchants and members of the guild. Handicraftsmen of all kinds form an inferior *caste*; but even among them there is a gradation of rank.

This aristocratical spirit likewise extends to what pertains to dress. It supplies, in some measure, *sumptuary laws*, or laws which regulate the expense of dresses to be worn by the different classes of society. In so far it has a very proper and beneficial influence, by restraining within due bounds that foolish vanity which would lead the maid to dress as gaily as her mistress, and to assume airs unbecoming her rank in life. All this is very well; but it goes farther than this. It is understood that the ladies of those in authority, and at the top of the tree, should enjoy the exclusive possession of some articles of fashion for a certain period, before they descend farther down the scale, and become too common to excite much popular admiration. It would cause some mortification, were a lady out of this sphere (unless acknowledged wealth were an apology) to display a new fashion almost as soon as the former exhibited theirs, at church or at a party. Such conduct would be reckoned an encroachment on privileges—an infringement of vested rights—and animadverted on with rancorous asperity. No, no; in small towns such liberties cannot be taken with impunity. The newest fashion from Edinburgh or London, of a bonnet or a shawl, a muff or a boa, must be exhibited at church or dinners, by two or three of the ladies of the topmost grades, for a certain period before it would be decorous for others to assume them, or the world would be thought to be turned upside down.

With regard to the prevalence of the aristocratical spirit in country towns, it must be remarked, that generally the women are most conspicuous in adhering the most pertinaciously, and in guarding, with rigorous vigilance, the supposed privileges of "their order;" and farther, that the *parvenus*, or new people, male and female, exceed in these respects all the families of long established respectability, and, in every point of view, are the least amiable and the least popular.

Another feature in the provincial portrait is the practice of gossiping and talking scandal. In those country towns where the population is very small, the sphere of observation is so circumscribed, that the inhabitants have a thorough knowledge of the origin, past history, and present circumstances of every individual residing in the place: hence every action of every man is taken into rigorous consideration by his neighbours, and, if in the least assuming, as it is called, condemned or ridiculed without mercy. There is not a dinner, nay, a supper, given in the whole town, but the fact is known next day by all the inhabitants, from the highest to the lowest—along with a thousand minute particulars, true or false, respecting the dishes, the guests, and even the subjects of conversation. Even if a lady is seen entering the door of a neighbour to make a call, it is observed by hundreds of curious eyes peering from behind green baize screens in the adjacent windows, and speculated upon and canvassed, as if it were a transaction of diplomatic importance. Almost every thing that any man does, and every thing that he says, becomes the subject of comment in other quarters; and whether a good or an ill construction is put upon it, depends entirely on the mood of the parties who take it under their consideration. The most of the people, not having full occupation in their own business, devote the remainder of their time to that of other people; and it is amazing what a disinterested expenditure of criticism, censure, and regret, takes place every day in one of these small communities, in reference to each other's concerns. It presents perhaps the most splendid picture in the world, of that generosity which places us above our own paltry and narrow interests, and sends our thoughts abroad yearning after the good of our fellow-creatures. One unfortunate result is, the repression of independent and manly feeling, which it is apt to produce in the best constituted natures. A man of the very best intentions finds himself so closely under surveillance, and so severely commented on, that he finds it necessary at length to put a mask upon his whole character and system of acting—speaks obliquely, and in a few well-chosen words—circumvents rather than approaches any objects he has in view—and even has to make the crossing of the street a matter of ambuscade. It is certainly much to be regretted that the comfort of many very worthy people is marred, in such scenes as those we are describing—often by the lightest and most thoughtless words of others. How much is it to be wished that men in general could treat each other, in absence, with a little more of that courtesy which is so useful in presence! How much is it to be wished that we were all a little more disposed to put a benevolent and liberal construction upon the actions and habits of our fellow-creatures!

Every small town has its *wag* or *wit*, whose jests keep it in amusement, much after the manner of a court buffoon of old. The town wit is frequently a cobbler, and sometimes a blacksmith or other artizan; but one thing is almost always the case—he is as poor as his wit is rich. If the town wit be a man of a good-natured turn, he is generally a humorist only—a mere sayer of droll and eccentric things; and in this event, he is commonly a very popular and beloved character. He is to be seen at resting hours, seated, it may be, on a stone, and surrounded with a group of neighbouring artizans, who listen with much delight to his humorous stories, and the still more humorous manner in which he relates them; while roars of hearty laughter frequently both interrupt and applaud him, until the hour be expired. But if, on the other hand, the wag be rather a wit than a droll, the probability is, that he delights in caricature, in sarcasm, and keen-pointed sallies of fancy. He takes a roguish pleasure in exposing to ridicule even personal defects, as well as frailties and foibles of the mind, and errors in the conduct of his neighbours. He feels he has got a sting, and he will use it, not for self-defence, but for the mere sake of annoyance, and from the vanity of showing off his gift. This character is never generally beloved; he is rather feared and shunned. A few admire his wit, and applaud his fine hits and thrusts, and this keeps his vanity alive, and urges him to continue his satirical course. Should such a thing as a sarcastic paragraph touching the place or its inhabitants appear in a newspaper, or should a poetical burlesque of any incident or public character be handed about in print, of course it is he who has done the deed; he is the sole delinquent, and must accordingly suffer the reproaches secretly bestowed upon him.

POPULAR INFORMATION ON LITERATURE.

THE ITALIAN POETS.

Petrarch.

Petrarch, more exactly designated Francesco Petracco, or Petraccolo, was born at Arezzo, in July 1304, being the son of Pietro Petracco, a Florentine notary, and the fellow-exile and intimate friend of Dante. The poet was brought up amidst all the difficulties proper to the condition of a banished family, the head of which could hardly obtain any regular means of subsistence. His father, after many vicissitudes, settled at Avignon, in the south of France, which was then and for many years after the seat of the Pope. Young Petrarch was educated at first by one Convennole, a humble schoolmaster at Carpentras, near Avignon. He very soon displayed a great fondness for the Latin classics, which he pored over from choice, while his young companions could hardly comprehend the rudiments. An attempt was afterwards made to give him a legal education, but in vain. He forsook and neglected all the necessary studies, in order to spend his time with Cicero, and other masters of Roman eloquence. His parents died while he was still a mere youth, and for a number of years it is not very clear how he contrived to live, though he appears to have finally embraced the ecclesiastical profession. His devotion to study seems to have at length recommended him to the attention of various great men, who were successively his patrons and supporters. In time, he collected a considerable library of classical manuscripts, including some which have since been altogether lost to the learned world

Though Petrarch was a man of profound learning, and in his own time was chiefly distinguished by his erudite essays in Latin prose, the attention of posterity has been exclusively directed to him as the author of several hundred sonnets in his native tongue, which he addressed to a lady named Laura, the object of a passion similar to that entertained by Dante for Beatrice. The story of Petrarch and Laura is perhaps one of the most remarkable which the history of amatory passion presents. Petrarch was in his twenty-third year, when, on Good Friday 1327, he encountered this fair vision in the church of St Claire, at Avignon. She was about twenty, had been married some time, and, according to the poet's own description, was remarkable for the elegance of her person. Her hair was of a golden brightness, her complexion purer than snow, her eyes as bright as stars, yet so soft and tender in their expression, that they inspired only feelings of love and reverence. In stature she was tall, and exquisitely graceful in her carriage; her voice was clear and musical, and her manner of conversing indicative of the dignity and sweetness which had an equal share in her character. The splendour of her dress corresponded to the richness of her beauty. Her hair was generally left to flow loose over her neck and shoulders, but was sometimes fastened up in a knot, and parted plainly on her forehead. Of her mind, it is said that she possessed a natural flow of wit and intelligence, but had received little advantage from study or education.

The manners of the ladies of Avignon are said to have been at that time by no means remarkable for delicacy; Laura, however, was a striking exception from the general rule. The breathings of the poet's affection must have soon met her ear; and as Petrarch quickly advanced in fame and public estimation, they could not fail to make some impression upon her. It is, nevertheless, allowed on all hands, that she never swerved for a moment from the dignity of the matron in favour of her admirer: it is not even plain that they ever so much as conversed together. For upwards of twenty years, Petrarch continued to write sonnets respecting her, every variation of his thoughts becoming the subject of one of those compositions. She, on the other hand, continued to act the part of a virtuous wife, became, it is said, the mother of eleven children, and was universally respected and beloved. The whole story, in fact, affords a striking instance of passion kept up without the hope, or perhaps even the wish, that it should come to a satisfactory termination. To blame the one for entertaining, or the other for not checking, a sentiment which generally meets the reprobation of the world, were vain, for it is impossible to divest ourselves of the idea that the whole affair was a convenience for poetical exercise; a notion which derives strength from the non-appearance of any resentment at any time manifested by the husband of the lady.

During the most of the time of Petrarch's supposed passion for Laura, he resided like a hermit in the romantic valley of Vaucluse, his only real object being, in our apprehension, the perfection of himself in poetry, so that he might become worthy of the laurel crown occasionally bestowed at Rome upon individuals who had eminently distinguished themselves in verse-making. His ambition was at length gratified, when, in one day, in August 1340, messengers arrived from Paris and Rome, proposing to him the honour of a public coronation. He preferred the latter, and the ceremony was performed under circumstances of great splendour. He was now acquainted with princes and nobles, any one of whom would have considered himself as honoured in no small degree by being allowed to maintain Petrarch at his court or residence. He seems to have been content, however, with the profits of an archdeaconry, which some of these patrons bestowed upon him.

In 1348, on the twenty-first anniversary of her first meeting with Petrarch, Laura died of the plague, and was tenderly bewailed by the poet in a number of sonnets. Of the general character of these celebrated compositions, we shall now quote the opinion of Mr Stebbing, as expressed in his Lives of the Italian Poets.

"Petrarch's reputation has now for many years rested solely on his Italian poems, which occupy less than two hundred pages out of thirteen hundred, of which the folio volume containing his works consists: Studying these productions without reference to the controversies which have been maintained respecting them, we find them possessing a charm sufficient to soothe and delight us, but not to awaken passion, or give birth to any feeling of power or sublimity. If

they were intended to convey an idea that the writer was under the influence of strong emotion, they are, in that respect, undoubted failures; for there is little poetry of any repute that makes a less vivid impression on the feelings. But it is not essential to all amatory poetry that it should be uniformly expressive of violent or intense excitement. The deepest seated passion is not always the readiest to reveal itself, and the lover may adore his mistress without addressing her in their ordinary intercourse in the language of ecstacy. In any case, Petrarch would seldom write in a highly impassioned style; and those who have most censured him for want of warmth and energy, should have first considered the circumstances under which he composed his poetry. However strong his love might be for Laura, his respect for her was equal to his love; and whether he intended the sonnets he wrote for her eye only, or for that of the world at large, he would scarcely address her in a manner unbecoming her situation and the purity of her character. Still farther:—Petrarch had rarely any means of addressing Laura but by his verses; and from the commencement of his passion to her death, he employed them as the common medium of communicating his sentiments. It was not merely on great occasions, when taking long farewells, or inspired with some sudden emotion, that he thus addressed her. Not a week, perhaps, passed without his writing on the subject of his love, and he was sufficiently Platonic, while breathing forth his verse, to believe that his spirit held communion with that of Laura. He wrote sonnets, in fact, not to make known his love, but to console himself under its disappointments: denied the pleasure of conversing with her who possessed his affections, he sought to deceive himself into the momentary belief of her presence, and he wrote as if he were speaking in the hearing of one who was day after day listening to his voice; whom he loved deeply, but to whom the strong language of passion would have been ill applied in this daily intercourse of thought.

Whether, therefore, we consider the situation of Laura, or the feeling which prompted Petrarch to dedicate such a multiplicity of sonnets to her name, we may find a reason for their being less expressive of strong emotion than many critics would have wished. In the one instance, he would have offended against the modesty of her whom he addressed; in the other, he would have written with more apparent vigour, but not in a manner more truly expressive of deep feeling. The heart becomes in time familiar with passion, as the body, it is said, may do with pain; and as the sufferer, who at the first feeling of anguish expresses himself in loud cries, but afterwards only in the low murmur of complaint, so passion of any kind uses a calmer language when of many years' continuance; and we might properly suspect its sincerity, if, after being long experienced, it spoke in the same tone as at first. The latest of Petrarch's sonnets are acknowledged to be his best. Laura's situation prohibited his expressing himself in a manner natural to the state of his feelings when first enamoured; but as his emotions became subdued, and her image grew familiar to his thoughts, he wrote with more ease and pathos, because with more freedom.

If we may thus account for the subdued style of Petrarch's amatory poetry, it lays claim for its other qualities to the highest praise. In what compositions shall we find more pleasing imagery, tenderer sentiments, or superior versification? Laura, it is true, is the constant theme, but it is only by the repetition of her name that the poet tires our patience. She appears before us adorned with some new grace in every sonnet, and though love only inspires the sentiments, they are almost infinitely varied in the expression. Sometimes yielding entirely to his fancy, at others availing himself of his learning, Petrarch was never at a loss for the ornaments of verse, and he not unfrequently abounds in the most beautiful figures and comparisons: but the chief charm of his sonnets is the soft and tranquil melancholy which breathes in both the thoughts and language—a gentleness of spirit which makes us feel that they could only have been written by a man delighting and living much in solitude. The air of Vaucluse seems fanning us as we read, and the murmur of its fountains, the song of birds in its laurel shades, and the sighs of the poet, steal pleasantly upon the imagination.

No poetry, without being either descriptive, impassioned, or romantic, ever gained so strong a hold on both the feelings and the fancy as Petrarch's. His sonnets are read with delight by persons who would turn with contempt from the amatory verses of other writers, and the greatest admirers of such poetry find a beauty in them which they look for in vain in any other of the kind. The sentiments of an elevated mind, rather imbued with passion than conquered by it, loving meditation the more because it has experienced agitation, and conscious of a pleasure in loving which exists independent of hope, or its other appliances—the sentiments of a mind like this find their way into all hearts, and by their mild and quiet influence, often make a deeper impression than others of a more stirring character. It is hence that the sonnets of Petrarch possess such a power of charming us; that they have so long retained their popularity, and have been taken as models by so many writers, but have scarcely ever been successfully imitated."

Petrarch was a man of warm feelings as a patriot, and exerted himself zealously on many occasions to advance the interests of his country. He was employed as an ambassador to different states, and both in that capacity, and by the use of his pen, seemed to have made the restoration of Italy to independence and tranquillity one of the leading objects of his life. Charles the Fourth, Emperor of Germany, while meditating some measures for the latter object, had an interview with Petrarch, at Mantua, and elicited some remarkable proofs of the unbending integrity of the man. The emperor spoke of his works, and manifested a wish to see them, especially that on Illustrious Men. To this Petrarch replied, that it was not yet completed, and that he required time and quiet to put the last hand to it. Upon which Charles intimated, that he should be glad to have it appear under his name. "But," says the poet, "I answered with that freedom which nature has given me, and which age and custom have confirmed and authorised, 'Great prince, to have it appear, and under your name, there is need of virtue on your part, and of leisure on mine.'" Astonished, as was natural in a monarch, at an answer so little flattering, the emperor desired him to explain his meaning; to which Petrarch replied, that much time was requisite for a work which was to comprise much in a little space; and that with regard to the dedication, he must labour to merit having his name placed at the head of the work; that it was not sufficient to wear a crown and possess a lofty title, but that he must possess the virtues, and perform the great actions which might worthily place him among the illustrious men whose portraits he was describing. "Live," continued he, "according to their example, in order that after having read their lives, your actions may render yours worthy of being read by posterity." The emperor smiled, but looked far from being displeased at the freedom of the exhortation.

The latter years of this great man's life were spent in lettered seclusion, first at the village of Garignano, about three miles from Milan, and finally near the small town of Arqua. In a letter to a friend, he describes, in the following pleasing terms, his mode of living at the former place:—"The tenor of my life is tranquil and uniform, for I am no longer tormented by the passions which held me captive in my youth. Like a weary traveller, I redouble my steps, as I approach the termination of my journey. I read and write day and night, and my only rest is sometimes doing the one, and sometimes the other. These are my sole occupations, and my sole pleasures. My health is so strong, my body so robust, that neither a more mature age, nor more serious occupations, nor abstinence, nor scourges, could have rendered me less subservient to the passions with which I have so long waged war. With regard to the gifts of fortune, I am equally distant from the two extremes, and indeed enjoy that mediocrity which is so much to be desired. In one thing only can I be an object of envy to others—which is, that I am more esteemed than many would wish me to be, and more so than wholly agrees with my quiet. Not only does the greatest prince of Italy, with all his court, love and honour me, but his people even respect me much more than I deserve, and love me without either knowing or seeing me—for I rarely go out, which, however, may be the very reason why I am so esteemed. I have passed at Milan an olympiad, and begun the last year of a lustrum. The kindness with which I am treated by every one, attaches me so much to Milan, that I love the very houses, the air, and the walls, to say nothing of my friends and acquaintances."

The esteem in which Petrarch finally came to be held, even in an age when his works could only be very sparingly circulated, is curiously exemplified by an anecdote thus related by Mr Stebbing:—"Henry Capra was a rich and noted watchmaker, possessing by nature a lively and penetrating mind, which he had diligently cultivated; but having begun his studies too late in life, he was more enthusiastical and fanciful than might have been expected from his age or character. His greatest ambition was to know and be known to Petrarch, and he employed every means that this ambition could suggest to effect his purpose: the poet became acquainted with his wish, and good-naturedly said, 'He shall have his desire gratified; it would be barbarous to refuse him that which will make him so happy, and cost me so little.' Nothing could exceed the delight with which he received the intimation of Petrarch that he was willing to accept his acquaintance. He immediately employed persons to copy all the works of his illustrious friend; placed his arms and portrait in every part of his house, and at last bade adieu to his profession, notwithstanding the advice of Petrarch on the subject, to devote himself entirely to letters. But he had not yet received a visit from the object of his veneration—this was all that he wanted to make his happiness complete. 'Let him but honour my house with his presence for only one day,' said he, 'and I shall be happy and glorious through all ages.' Some years, however, it seems passed away before the much-desired visit was paid. At length the happy day arrived which was to crown him with fame, and on the 18th of October 1358, Petrarch proceeded to Bergamo. The governor and several of the chief inhabitants came out to meet him, and offer him a lodging in the palace. Poor Capra was in great distress while these invitations were being given. He had accompanied his friend from the commencement of the journey, and to secure him, had associated with himself some men of literature whose conversation might render the way less tedious. His anxiety was at last removed by Petrarch's declaring that he was the guest of Henry Capra solely, and that he would lodge nowhere but in his house! His reception there was such as might have been expected. The furniture of the chamber in which he slept was all purple, and the bed superbly gilt, Capra declaring that no one had ever yet slept in it, or ever should again, except Petrarch. The next day our poet took his leave, but the watchmaker accompanied him a long way on the road, and was at last torn from him by violence, his friends fearing that the joy he had experienced would either make him ill or mad. Some time before this, a poor blind old grammarian had walked over the best part of Italy to express the same feeling as Capra."

Petrarch was found, July 18, 1374, dead in his study, with his head leaning on a book. His remains were interred in the church at Arqua, with almost royal magnificence.

If we put out of view one misplaced passion, which after all appears an exceedingly doubtful and obscure affair, the character of Petrarch is one of the most spotless of which we have any record. His whole life seems to have been spent in perfect innocence. He had the good of his country and of his fellow-creatures constantly at heart. All unworthy passions he had succeeded in trampling down, and he only indulged in the most virtuous and beneficial. He never employed his pen for any purposes which were not strictly honourable and pure; and this is the more remarkable, in so far as he lived in a very dissolute and turbulent age. His manners and discourse, on the other hand, were so free from malevolence, that he hardly appears during life to have made a single enemy. In personal appearance, he was thin, with a long aquiline face, in which there ever shone a sweet and studious gravity.

FISH-PRESERVES.

Various country gentlemen have in recent times attempted the establishment of *fish-preserves* on their estates, from which they might, as suited their pleasure, draw a supply of fish for their table, without the trouble of casting nets or employing boats; and it appears exceedingly probable that such a practice may be pursued with a considerable degree of pleasure and satisfaction, especially on our sea-shores, or the banks of the numerous estuaries and large streams that intersect the land. Those who have suitable premises, or an opportunity for establishing fish-preserves, as well as those who take an interest in details illustrative of natural history, will be pleased with the following account of a celebrated fish-pond, at Logan, in Galloway, on the south-west coast of Scotland, written by the ingenious Mr M'Diarmid of Dumfries, and published by him in a volume of amusing pieces.*

"In July 1824, I visited for the first time the beautiful bay and harbour of Portnessock, waiting on Colonel M'Dowall, and, with his permission, paid my respects to the finny tribes that people the far-famed fish-pond at Logan; and rarely has my curiosity been more highly gratified. This fish-pond is unlike any thing I ever met with. It was formed in 1800, at an expense of several hundred pounds, and has furnished a wholesome article of food, fatter than it can be found in the open ocean, for considerably upwards of a quarter of a century. The pond, according to Mr Matheson, builder's measurement, is thirty feet deep, by one hundred and sixty in circumference—that is, at the top, where a wall of solid masonry, several feet high, encircles the rock on every side. The area within was wholly hewn and blasted from the living rock, and communicates with the tide by one of those fissures so common on bold and precipitous coasts. Indeed, if I remember right, it was this circumstance that led to its formation. A ledge of rock, marching with the beach, and lashed by the waves of a thousand winters, was known to be partially undermined; and it occurred to the proprietor, Colonel M'Dowall of Logan, that, by excavating the central or principal mass, a basin might be formed, not only open to the influence of the sea, but so deep, even at neaps, as to enable fishes to disport freely in their native element, though dependent on man for their daily food, and somewhat hampered in their migratory propensities. And this project he successfully executed. By blasting the rock, in a lateral direction, a communication was opened with the natural tunnel, and a barrier erected at the inner extremity, formed of large loose stones, arranged so as to prevent the ingress and egress of any body less insinuating than water. Attached to the pond, and forming its gateway, is a neat Gothic cottage for the accommodation of the fisherman, and round and round, the rock is surmounted by a stone wall, grey with lichen, and beautifully festooned with honeysuckle, 'bin-wood,' and other creeping plants. In every state of wind and tide—in summer, when the cod seek the deep water in quest of herrings—in winter, when not a boat dare venture to sea—Colonel M'Dowall can command a limited supply of the finest fish, and study at his leisure their instincts and habits. From the back-

* Sketches from Nature. Oliver and Boyd, Edinburgh; Simpkin and Marshall, London.

door of the lodge, a stair, neatly cut from the solid rock, conducts the visitor to the usual halting-place—a large flat stone projecting into the water, and commanding a view of every part of the aquatic prison. When the tide is out, this stone is completely dry, though the pond remains filled to the depth of eight feet (its bottom being excavated below the level of the sea), and the stranger perceives, not without surprise, a hundred mouths simultaneously opened to greet his arrival. Fishes, in fact, hear as well as see; and the moment the fisherman crosses his threshold and descends the steps, the pond is agitated by hundreds of fins, and otherwise thrown into the greatest commotion. Darting from this, that, and the other corner, they move as it were to a common centre, elevate their snouts, lash their tails, and jostle one another with so little ceremony, that they appear, on a first view, to be menacing an attack on the poor fisherman, in place of the creelful of limpets he carries. Conceive a lady feeding her poultry, a knot of urchins scrambling for coppers, or a pack of fox-hounds disputing the property of a solitary bone, and you will have some idea of the ludicrous scramble which, even in this watery world, attends the distribution of the *loaves* and *fishes*. Loaves, however, is an improper term, for as the guardian of the pond truly averred, the cod, &c. 'will take nothing but what comes out of the sea.' Touching this point, I naturally felt a little sceptical, and to remove all doubt, purposely dropped into the pond a few crumbs of bread, composed both of oatmeal and flour. In an instant they were darted at by countless competitors, and as often voided, the moment their palates discovered the cheat, until the experiment had made the round of the pond, and the crumbs were left floating about, to be picked up by the less fastidious swallow. This part of their economy is exceedingly curious, and though we know for certain that trouts have been taught to eat potatoes and porridge, it is probable that nothing but the direst necessity could induce the cod and blochin to partake of the same vegetable fare.

In July 1824, and for some years previous, not a few of the fishes were actually so tame, that they fed greedily out of the hand, and would have bit their benefactor's fingers into the bargain, if he had been foolish enough to allow them; while others were so shy, that the keeper discoursed of their different *tempers* as a thing quite as palpable as their different sizes. One gigantic cod, the patriarch of the pond, which, the fisherman asserted, answered to his name, and who not only drew near, but turned up his snout most beseechingly when he heard the monosyllable Tom, very forcibly arrested my attention. This unfortunate, when I first saw him, had spent fifteen years in a state of comparative captivity, increasing gradually in bulk and weight, though from old age, accident, or disease, he at last became totally blind. From this infirmity he had no chance in the scramble for food, and perhaps the same cause (necessity) which renders the redbreast so pert and familiar in winter, made poor old Tom the tamest fish in the pond. The fisherman, on his part, was very kind to him, and it was really affecting, as well as curious, to observe the animal raising himself in the water, resting his head on the feeding-stone, and allowing it to be gently patted or stroked, gaping all the while to implore that nourishment which he had no other means of obtaining. It was evident, however, that he could distinguish between the fisherman's voice and touch, and those of any other person; for when the writer of this article approached, and attempted to pat his back and head, he winced considerably, and retreated to the water, though he always returned to the same spot. In 1826, old Tom died, after his body had been greatly wasted, and was perhaps the first cod on record, whose remains, by being interred under the fragrant turf, escaped the general, if not the universal fate of animals, whose home is the great deep.

The exact number of the fish in the pond was not known when I visited Port-Logan; but, judging from the eye, it could not be under three or four hundred. Cod appeared to be the prevailing species, but there were also blochin or glassin, haddocks, flounders, and various other kinds. The flounders, however, were shyer than the rest; and although they could be caught with set lines, and were sometimes seen peering timidly near the surface, they never joined in the scramble for food. Salmon, though they may live, cannot breed in an artificial basin, bulwarked in by rock on all sides, unless special measures were taken for enabling them to communicate with some neighbouring burn, and in July 1824, there was only one specimen of this favourite fish in the pond.

It is a popular, if not a scientific opinion, that fish continue to increase in bulk as long as they live, though the patriarchal cod mentioned above, fell off visibly long before he died; but this, no doubt, arose from his blindness, which prevented him, when rations came to be divided, in spite of the friendship and solicitude of the fisherman, from obtaining any thing like his proper share. Although regularly baited every second day, the fish are so voracious that you have only to attach a limpet to a hook, and drop it into the pond, when a hundred mouths will be opened to receive it. A selection can thus be made of any trout the angler pleases, and the whole population could be taken out, marked, weighed in scales, and reconsigned to the pool, without sustaining the least harm. I myself tried the experiment with the clumsiest possible apparatus, and after determining to which mouth I should give the preference, captured two or three bulky cod, with all the complacency of a dandy angler.

That the cod, blochin, &c. deposit spawn, there can be no doubt, but the moment the fry appears, it is so greedily devoured, that the renovating principle is, and must remain, in abeyance. The same thing no doubt occurs to a great extent in the open ocean; where the stronger uniformly prey upon the weaker, but there the supply either exceeds the demand, or is scattered over such an extensive surface, that a portion of the fry is left undevoured—a wise and beneficent provision of nature for recruiting the numbers of a class of animals that form so important a part of the food of man. That salt-water fishes are not unfrequently put to their shifts, may be inferred from the fact, that the cod at Logan are both better and fatter than those caught any where else, although it may be true that the confinement they endure tends to promote the same end. To cater for them is no easy task, and the fisherman must employ part of his time in gathering sand-eels, crabs and limpets, the former of which are given raw, while the latter must be scalded in order to disengage the meat from the shell.

Not a few individuals with whom I have conversed, are decidedly of opinion that a fish-pond, constructed on a similar principle, would prove a good speculation in the neighbourhood of London; and however this may be, one thing is clear, that Colonel M'Dowall and his family possess facilities which, if carefully cultivated, would enable them to make, not merely popular, but scientific contributions to natural history."

In a number of the Quarterly Journal of Agriculture may be found an article more minutely descriptive of the plan of forming fish-preserves in inland situations, as well as on the sea-shores.

LINES BY GALT.

The following pathetic verses are given by Mr Galt in an early part of the narrative of his life, as a description of his unfortunate condition:—

Helpless, forgotten, sad, and lame,
On one lone seat the live-long day,
I muse of youth and dream of fame,
And hopes and wishes all away.

No more to me, with carol gay,
Shall mounting lark from pasture rise,
Nor breezes bland on upland play,
Nor far fair scenes my steps entice.

Ah, never more beneath the skies
The winged heart shall soar,
Nor e'er be reached the goal or prize—
The spells of life enchant no more.

The burning thought, the boding sigh,
The grief unnamed that old men feel,
The languid limbs that withering lie,
The powerless will's effectless zeal;
All these are mine, and heaven bestows
The gifts, but still I find them woes.

NARRATIVE OF THE JEWS OF YORK.

Almost every one has heard or read of the sufferings to which various classes of people in this country were at one period subjected, not on account of their misdemeanours, but their peculiar opinions on abstract subjects. In the melancholy enumeration of these dismal passages in our history, none presents us with such a dreadful example of what human nature is capable of enduring when forced to sink under the last efforts of despair, as the destruction of the Jews of York. No narrative that we are acquainted with is so able to make us appreciate the blessings of modern civilization, and the improved state of feeling betwixt one class of thinkers and another, as that to which we refer, and which is thus given by D'Israeli, in his interesting work, "The Curiosities of Literature:"—

"When Richard the First ascended the throne [in 1189], the Jews, to conciliate the royal protection, brought their tributes. Many had hastened from remote parts of England, and appearing at Westminster, the court and the mob imagined that they had leagued to betwitch his majesty. An edict was issued to forbid their presence at the coronation; but several, whose curiosity was greater than their prudence, conceived that they might pass unobserved among the crowd, and ventured to insinuate themselves into the abbey. Probably their voice and their visage alike betrayed them, for they were soon discovered; they flew diversely in great consternation, while many were dragged out with little remains of life.

A rumour spread rapidly through the city, that, in honour of the festival, the Jews were to be massacred. The populace, at once eager of royalty and riot, pillaged and burnt their houses, and murdered the devoted Jews. Benedict, a Jew of York, to save his life, received baptism; and returning to that city, with his friend Jocenus, the most opulent of the Jews, died of his wounds. Jocenus and his servants narrated the late tragic circumstances to their neighbours, but where they hoped to move sympathy, they excited rage. The people at York soon gathered to imitate the people at London; and their first assault was on the house of the late Benedict, which having some strength and magnitude, contained his family and friends, who found their graves in its ruins. The alarmed Jews hastened to Jocenus, who conducted them to the governor of York Castle, and prevailed on him to afford them an asylum for their persons and effects. In the meanwhile, their habitations were levelled, and the owners murdered, except a few unresisting beings, who, unmanly in sustaining honour, were adapted to receive baptism.

The castle had sufficient strength for their defence; but a suspicion arising that the governor, who often went out, intended to betray them, they one day refused him entrance. He complained to the sheriff of the county; and the chiefs of the violent party, who stood deeply indebted to the Jews, uniting with him, orders were issued to attack the castle. The cruel multitude, united with the soldiery, felt such a desire of slaughtering those they intended to despoil, that the sheriff, repenting of the order, revoked it, but in vain; fanaticism and robbery once set loose, will satiate their appetency for blood and plunder. They solicited the aid of the superior citizens, who humanely refused it; but having addressed the clergy, were by them animated and conducted.

The leader of this rabble was a canon regular, whose zeal was so fervent, that he stood by them in his surplice, which he considered as a coat of mail. Their attacks continued, till at length the Jews perceived they could hold out no longer, and a council was called to consider what remained to be done in the extremity of danger.

Among the Jews, their elder Rabbin was most respected. It has been customary with this people to invite for this place some foreigner, renowned among them for the depth of his learning and the sanctity of his manners. At this time the *Haham* or elder Rabbin was a foreigner, who had been sent over to instruct them in their laws, and was a person, as we shall observe, of no ordinary qualifications. When the Jewish council was assembled, the *Haham* rose, and addressed them in this manner—'Men of Israel! the God of our ancestors is omniscient, and there is no one who can say, why doest thou this? This day he commands us to die for his law; for that law which we have cherished from the first hour it was given, which we have preserved pure throughout our captivity in all nations, and which, for the many consolations it has given us, and the eternal hope it communicates, can we do less than die? Posterity shall behold this book of truth sealed with our blood; and our death, while it displays our sincerity, shall impart confidence to the wanderer of Israel. Death is before our eyes, and we have only to choose an honourable and easy one. If we fall into the hands of our enemies, which you know we cannot escape, our death will be ignominious and cruel; for these Christians, who picture the spirit of God in a dove, and confide in the meek Jesus, are athirst for our blood, and prowl around the castle like wolves. It is, therefore, my advice, that we elude their tortures; that we ourselves should be our own executioners; and that we voluntarily sure render our lives to our Creator. We trace the invisible Jehovah in his acts; God seems to call for us; but let us not be unworthy of that call." Having said this, the old man sat down and wept.

The assembly was divided in their opinions. Men of fortitude applauded its wisdom, but the pusillanimous murmured that it was a dreadful council.

Again the Rabbin rose, and spoke these few words in a firm and decisive tone—'My children! since we are not unanimous in our opinions, let those who do not approve of my advice depart from this assembly.' Some departed, but the greater number attached themselves to their venerable priest. They now employed themselves in consuming their valuables by fire; and every man, fearful of trusting to the timid and irresolute hand of the women, first destroyed his wife and children, and then himself. Jocenus and the Rabbin alone remained. Their life was protracted to the last, that they might see every thing performed according to their orders. Jocenus, being the chief Jew, was distinguished by the last mark of human respect, in receiving his death from the consecrated hand of the aged Rabbin, who immediately after performed the melancholy duty on himself.

All this was transacted in the depth of the night. In the morning the walls of the castle were seen wrapt in flames, and only a few miserable and pusillanimous beings, unworthy of the sword, were viewed on the battlements, pointing to their extinct brethren. When they opened the gates of the castle, these men verified the prediction of their late Rabbin; for the multitude, bursting through the solitary courts, found themselves defrauded of their hopes, and in a moment avenged themselves on the feeble wretches who remained."

Such is the dreadful narrative of the Jews of York, of whom five hundred thus destroyed themselves. It is impossible, on any right principle, to vindicate their act of self-immolation; but who can withhold their sympathy from men who were forced by the brutality of their oppressors to such a fearful extremity? If history teach by examples, let this lesson which it affords, at least, sink deeply in the heart; and may we thence learn to cultivate the blessings of peace and good will among all classes of men, without respect of party, or any abstract distinction whatsoever.

Column for Mothers.

Mrs Child, an American authoress, who, like the excellent Miss Edgeworth, has done a great deal to instil rules of conduct into the minds of young people, by means of a series of useful little works, gives the following valuable advices to mothers on the subject of teaching children politeness:—

"In politeness, as in many other things connected with the formation of character, people in general begin outside, when they should begin inside; instead of beginning with the heart, and trusting that to form the manners, they begin with the manners, and trust the heart to chance influences. The *golden rule* contains the very life and soul of politeness. Children may be taught to make a graceful courtesy, or a gentlemanly bow; but unless they have likewise been taught to abhor what is selfish, and always prefer another's comfort and pleasure to their own, their politeness will be entirely artificial, and used only when it is their interest to use it. On the other hand, a truly benevolent kind-hearted person will always be distinguished for what is called native politeness, though entirely ignorant of the conventional forms of society.

I by no means think graceful manners of small importance. They are the outward form of refinement in the mind, and good affections in the heart, and as such must be lovely. But when the form exists without the vital principle within, it is as cold and lifeless as flowers carved in marble.

Politeness, either of feeling or of manner, can never be taught by set maxims. Every-day influence, so unconsciously exerted, is all-important in forming the characters of children, and in nothing more important than in their manners. If you be habitually polite, your children will become so, by the mere force of imitation, without any specific directions on the subject. Your manners at home should always be such as you wish your family to have in company. Politeness will then be natural to them; they will possess it, without thinking about it. But when certain outward observances are urged in words, as important only because they make us pleasing, they assume an undue importance, and the unworthiness of the motive fosters selfishness. Besides, if our own manners are not habitually consistent with the rules we give, they will be of little avail; they will in all probability be misunderstood, and will certainly be forgotten.

Foreigners charge the Americans with a want of courtesy to each other in their usual intercourse; and I believe there is some truth in the accusation. On all great occasions, however, they are ready, heart and hand, to assist each other; but how much more gracefully and happily the French manage in the ten thousand petty occurrences of life! And, after all, life is made up of small events. The golden chain of existence is composed of innumerable little links; and if we rudely break them, we injure its strength, as well as mar its beauty.

It is a graceful habit for children to say to each other, 'Will you have the goodness?'—and 'I thank you.' I do not like to see prim, artificial children; there are few things I dislike so much as a miniature beau or belle. But the habit of good manners by no means implies affectation or restraint. It is quite as easy to say, 'Please to give me a piece of pie,' as to say, 'I want a piece of pie.'

The idea that constant politeness would render social life too stiff and restrained, springs from a false estimate of politeness. True politeness is perfect ease and freedom. It simply consists in treating others just as you love to be treated yourself. A person who acts from this principle will always be said to have 'sweet pretty ways with her.' It is of some consequence that your daughter should know how to enter and leave a room gracefully; but it is of prodigiously more consequence that she should be in the habit of avoiding whatever is disgusting or offensive to others, and of always preferring their little pleasure to her own. If she have the last, a very little intercourse with the world will teach her the first.

I believe nothing tends to make people so awkward as too much anxiety to please others. Nature is graceful; and affectation, with all her art, can never produce any thing half so pleasing. The very perfection of elegance is to imitate nature as closely as possible; and how much better it is to have the reality than the imitation! I shall probably be reminded that the best and most unaffected people are often constrained and awkward in company to which they are unaccustomed. I answer, the reason is, they do not act themselves—they are afraid they shall not do right, and that very fear makes them do wrong. Anxiety about the opinion of others fetters the freedom of nature. At home, where they act from within themselves, they would appear a thousand times better. All would appear well, if they never tried to assume what they did not possess. Every body is respectable and pleasing so long as he is perfectly natural. I will make no exception—Nature is *always* graceful. The most secluded and the most ignorant have some charm about them, so long as they affect nothing—so long as they speak and act from the impulses of their own honest hearts, without any anxiety as to what others think of it.

Coarseness and vulgarity are the effects of education and habit; they cannot be charged upon nature. True politeness may be cherished in the hovel as well as in the palace; and the most tattered drapery cannot conceal its winning charms.

As far as is consistent with your situation and duties, early accustom your children to an intercourse with strangers. I have seen young persons who were respectful and polite at home, seized with a most painful and unbecoming bashfulness as soon as a guest entered. To avoid this evil, allow children to accompany you as often as possible, when you make calls and social visits. Occasional interviews with intelligent and cultivated individuals have a great influence on early character and manners, particularly if parents evidently place a high value upon acquaintances of that description. I have known the destiny of a whole family changed for the better, by the friendship of one of its members with a person of superior advantages and correct principles.

But it must be remembered that a call, or a social visit, may be made almost as injurious as a party, if children be encouraged in showing off, or constantly habituated to hearing themselves talked about. Much as the failing has been observed and laughed at, it is still too common for mothers to talk a great deal about their children. The weariness with which strangers listen to such domestic accounts is a slight evil compared with the mischief done to children, by inducing them to think themselves of so much importance: they should never be taught to consider themselves of any consequence, except at home in the bosom of their own families.

Nothing tends to foster the genuine politeness which springs from good feeling, so much as scrupulous attention to the aged. There is something extremely delightful and salutary in the free and happy intercourse of the old and young. The freshness and enthusiasm of youth cheers the dreariness of age; and age can return the benefit a hundred-fold, by its mild maxims of experience and wisdom. In this country, youth and age are too much separated; the young flock together, and leave the old to themselves. We seem to act upon the principle that there cannot be sympathy between these two extremes of life; whereas there may be in fact a most charming sympathy—a sympathy more productive of mutual benefit than any other in the world.

The aged, from the loneliness of their situation, the want of active employment, and an enfeebled state of health, are apt to look upon the world with a gloomy eye, and sometimes their gloom is not unmixed with bitterness; hence arises the complaint of their harshness and asperity towards the follies of youth. These evils, so naturally growing out of their isolated situation, would seldom gain power over the old, if they were accustomed to gentleness, attention, and deference from the young; they would be softened by juvenile love, and cheered by juvenile gaiety. Such intercourse sheds a quiet brightness on the decline of life, like sunshine on a weather-beaten tree, or a moss-covered dwelling. What is there on earth more beautiful than an aged person full of content and benevolence!

One very prevalent fault among children is a want of politeness to domestics. Young people should not, from mere whim and caprice, be allowed to make demands upon the time and patience of those who are hired to attend upon the family. They should make no unnecessary trouble in the kitchen; and when they ask for any thing, they should speak politely, saying, 'Will you have the goodness?' 'I thank you,' &c. Such conduct greatly tends to make domestics more respectful, kind, and obliging.

Mrs Madison was esteemed the most thoroughly polite woman in America. Others might perhaps enter a room as gracefully, or superintend at table with as much dignity; the secret of her power lay in her wonderful adaptation to all sorts of characters. She was emphatically an *observing woman*. As Jefferson had no wife, she presided sixteen years at Washington, during all which time she is said never to have forgotten the most trifling peculiarities of character, that had once come under her observation: she always remembered them, and fashioned her conversation accordingly. Some may object to the exercise of this power, lest it should lead to insincerity; and the charge may well be brought against that kind of false politeness, which springs merely from a love of popularity. Politeness is not the only good thing corrupted by an unworthy motive; all precious coins have a counterfeit. When we are polite to others entirely for *our own sakes*, we are deceitful; nothing selfish has truth and goodness in it. But there is such a thing as true politeness, always kind, but never deceitful. It is right to cherish good-will towards all our fellow-creatures, and to endeavour to make them as happy as we conscientiously can. The outward forms of politeness are but the expressions of such feelings as should be in every human heart. It would be wrong to tell people we love them dearly, when in fact we know nothing about them; or to urge them to visit our houses, when we do not want to see them. But we are bound to be kind and attentive to all our fellow-creatures when they come in our way, and to avoid giving them any unnecessary pain, by our manners and conversation.

In order to teach children the right sort of politeness, it must be taught through the agency of a pure motive. They should not be taught to observe and respect the feelings of others for the sake of making themselves pleasing, but merely because it is kind and benevolent to do so.

Outward politeness can be learned in set forms at school; but at the best, it will be hollow and deceptive. Genuine politeness, like every thing else that is genuine, must come from the heart."

JANET AND HER WEB.

Many years ago, in the parish of Carsphairn, in Galloway—a rude and sequestered district—there were only three freemasons, the minister, and a tailor, and a mason. The mason, being desirous to introduce his son to the same mystery, caused a lodge to be called for the purpose at a lonely cottage, where the ceremonies were proceeding when a knock was heard at the door. The mason, whose name was Dun, went to see who it was, and found an old woman, who addressed him as follows:—

"The masons are met the nicht?"

"Yes."

"Weel, ye ken my web was stolen last week."

"Yes, Janet; but what business has that wi' the mason meeting?"

"Ou, ye ken, ye'll be raising the de'il, and I wad just like if you wad ask him, *since he's there at ony rate*, wha stole the web."

"Oh, ay, Janet; just you gang away, then, and we'll see what we can do."

Mr Dun then returned to the interior of the cottage, and mentioned to the minister what had passed between him and the old woman. The clergyman rebuked him severely for conceding to the superstitious notions of the aged crone, and said he feared that it would "affront them a'." "Nae fear o' that," answered the mason; "just leave it all to me."

Next day, when Janet called upon Mr Dun, he told her that "the de'il" had not exactly communicated the name of the thief, but he had mentioned that if the goods were not returned before Thursday next, the house of the guilty person would fall upon him in the night-time, and the whole family would be killed. This, he said, was a great secret, and he strictly forbade her communicating it to more than one person.

Away went Janet, quite satisfied; although it might have been expected to occur to her, that the prediction of punishment to a thief was not exactly a characteristic piece of conduct on the part of Old Nick. The secret was speedily imparted to her next-door neighbour, with many injunctions as to the propriety of letting it go no farther; notwithstanding which, it was known to the whole parish before night.

On the third morning thereafter, Janet's web was found lying at her door, with a part which had been cut off attached to the main body of it with pins. The story is here (for the first time) put into print, as in two respects illustrative of the superstitions which at no distant period prevailed among the rustic people of this country. If a web were now stolen in a country place, neither would the loser think of consulting the devil for the name of the culprit, nor would the culprit be in any fear of immediate vengeance from that spirit.

LACE MADE BY CATERPILLARS.

A most extraordinary species of manufacture (says Mr Babbage, in his work on Manufactures) has been contrived by an officer of engineers residing at Munich. It consists of lace and veils, with open patterns in them, made entirely by caterpillars. The following is the mode of proceeding adopted:—Having made a paste of the leaves of the plant on which the species of caterpillar he employs feeds, he spreads it thinly over a stone, or other flat substance, of the required size. He then, with a camel-hair pencil dipped in olive oil, draws the pattern he wishes the insects to leave open. This stone is then placed in an inclined position, and a considerable number of the caterpillars are placed at the bottom. A peculiar species is chosen which spins a strong web, and the animals commence at the bottom, eating and spinning their way up to the top, carefully avoiding every part touched by the oil, but devouring every other part of the paste. The extreme lightness of these veils, combined with some strength, is truly surprising. One of them, measuring twenty-six and a half inches by seventeen inches, weighed only 1.51 grains, a degree of lightness which will appear more strongly by contrast with other fabrics. One square yard of the substance of which these veils are made weighs four grains and one-third, whilst one square yard of silk gauze weighs one hundred and thirty-seven grains, and one square yard of the finest patent net weighs two hundred and sixty-two grains and a half. The ladies' coloured muslin dresses cost ten shillings per dress, and each weighs six ounces, the cotton from which they are made weighing nearly six and two-ninth ounces avoirdupois weight.

London: Published, with Permission of the Proprietors, by Orr & Smith, Paternoster Row; G. Berger, Holywell Street, Strand; Bancks & Co., Manchester; Wrightson & Webb, Birmingham; Willmer & Smith, Liverpool; W. E. Somerscale, Leeds; C. N. Wright, Nottingham; Westley & Co. Bristol; S. Simms, Bath; J. Johnson, Cambridge; W. Gain Exeter; J. Purdon, Hull; G. Ridge, Sheffield; H. Bellerby, York; J. Taylor, Brighton; and sold by all Booksellers, Newsmen, &c. in town and country.—Chambers's Historical Newspaper, a Supplement to the present publication, is published on the first of every month; and Chambers's Information for the People, of which every number is a distinct subject of human knowledge, and which will be completed in one volume, appears once every fortnight.

SMALL AFFAIRS.

We learn, by common experience and observation, that life does not consist of a repetition of great or apparently important actions, but of duties generally of the most trifling nature. The young, in entering upon a scene of active exertion, miscalculate seriously when they suppose that they will be called upon to distinguish themselves by some glorious deed, or to gain celebrity by a series of great and difficult actions, before they receive the approbation of their fellows, and come into the enjoyment of an honourable and luxurious repose. There are comparatively few whose fate leads them into enterprises of such a description. By far the greater proportion of persons move in a sphere of life in which they are called on to perform the simplest and the easiest duties. Life consists of a round of minute trifling actions, unworthy of notice in a biography, and in general no way interesting even to the actors themselves. A man rises in the morning and dresses himself; he breakfasts, dines, and perhaps sups; he then sleeps, and in due time rises again, and again goes through the same dull routine. As for his fore and afternoons, he fills them up by attending to his business, whatever it is; and in the intervals of leisure recreates himself in the bosom of his family. And so his life is spent, from, probably, his thirtieth year, till the close of his existence.

But although most men thus pass away their time, and are rarely obliged to put forth any very extraordinary effort either for subsistence or applause, they are necessitated to pay a pretty close attention to that on which they are ordinarily employed. In this consists one of the great secrets of worldly success. Once in twenty years, or so, we hear of an individual who is crowned with honour and loaded with wealth, by making a dash—by some bold enterprise, carried to a fortunate conclusion. But these are exceptions—they afford no rule for general guidance. On making our choice of a profession—and it does not seem of the last consequence what the profession is—or in engaging in any piece of business whatsoever, the trick of success, as we have just said, lies in pursuing it with such a scrupulous attention to trifling details, that hardly any thing is suffered to escape notice.

While we believe few men will exactly contest the propriety of attending to the trifling duties of life, most men will differ as to the exact degree to which the attention should be ultimately carried. Every one stops short at a stage regulated by his personal feelings or convenience. Now, we can safely say, from all that has ever come under our own observation, that far more—ay, a thousand times more—err, from paying too little than too much attention in this respect. Many imagine that they are sufficiently attentive to their interests, if they only heed the great things, and let the little alone, which they believe will take care of themselves. They think and think about some grand speculations they will by and bye enter into, or what astonishing feats they will perform next spring, or what efforts they will make when some particular law is abrogated, to allow them to carry on some particular branch of trade; and so they spend an immense deal of time in theorising, while in the interval they are forgetting the main chance; that is, they are giving up attention to their present occupation, which is falling into decay for lack of supervision.

Oh! I cannot be troubled doing this or that—or going to such a place—or what signifies it that I am not at my place of business for an hour an hour is neither here nor there—those I have employed can do all that is wanted—it would be a hard case, indeed, if I were to be a drudge all my days. With this species of fond indulgence, men treat fortune as if it were to be always at their beck—as if the world would stand still till they found it convenient to move forward. It is a fallacy of many young, and of some middle-aged persons, to suppose that protracted evening amusements are allowable, seeing that they do not interfere with business hours. If they really did not encroach on the time allotted to exertion, there might be little to say on the contrary. But that they do so, must be obvious to all except those whose self-indulgence has exposed them to the delusion. No man who squanders his spirits and energies in nocturnal debauch can possibly re-address himself to the business of the world next day with the same *power*, as if he had retired to rest at the proper hour, after a moderate recreation. If he takes his usual quantity of sleep, he is belated; if not, he comes to his labours with but a part of himself. Nor is this all: systematic indulgences of this kind cannot be carried on without arrangements, and saunterings, and meetings with boon companions during the day, all of which divert the attention of an individual from that which most truly concerns him. And what is the result of a habitual practice of this kind?—a dislike of all steady employment, a failure of the powers of application, an impaired constitution, deranged circumstances, ruin, and death. A prudent man knows that a proper spending of the time of relaxation is as necessary to success as is the proper spending of the hours of business.

Innumerable instances are at present in our recollection, of young men in business losing great advantages by taking small things too easily. Although possessed of a considerable amount of capital, good connexions, good education, and good abilities, they allowed the possibilities of success in great things to engross so much of their notice, that they were heedless of the minutiæ of ordinary affairs, as well as of the value of their hours of relaxation, and therefore lost themselves in a maze of difficulties. The time they were planning their wonderful projects, and amusing themselves, and leaving their trifling duties to be performed by dependents, others were improving their condition by the closest and most effectual exertions, by seeing almost every detail executed under their immediate inspection, so that in the end they outstripped those who commenced under much more advantageous circumstances, and had at first far higher promises of well-doing.

One of the silly reasons which young men sometimes give for not being more extensively acquainted with the details of not only their own profession, but the general business of life, is, that it would be *low* to stoop to make themselves masters of such minutiæ. This dread of doing what is thought to be *low* is a sad barrier in the way to wealth and respectability. The lives of most men who have distinguished themselves either in military or civil professions, abound in instructive examples of what may be accomplished by attention to the lesser details of any species of occupation; and we frequently find, that the greater the celebrity to which a man has attained, the closer has been his observation of the minor duties of his profession. It is told that Bonaparte considered no detail too *low* for his inspection, and nothing too trifling to be unworthy of notice. The Duke of Wellington acted upon the same principle in his campaigns: one day, inquiring of an officer about some minute details regarding the equipage of the troops, the officer replied, "that he did not consider the knowledge of such things within his province." "Not within your province!" exclaimed the Duke; "why, sir, I know the number of nails in every soldier's shoe."*

The amount of valuable information, on all kinds of subjects, with which many individuals have it in their power to store their minds, and which by incidental circumstances may be brought to bear on some useful object, merely by attending to things apparently trifling—by considering no source of information too low, provided it be an honourable one, is altogether astonishing. The time that most people are consuming in indolence, or with a disregard of the minutiæ of general occupation, others, who are aware of the value of knowledge, are assiduously picking it up wherever it is to be found, and carefully applying it wherever it is discovered to be useful. By this means a man becomes impregnable at all points; he is able to say something on all subjects; he obtains the reputation of a man of intelligence; and his force of character, as well as his known application, lead him to offices of distinction and respectable opulence.

BEGINNINGS.

The number of people who have the ambition of attempting literary composition is one of the remarkable features of this age. There is hardly a well-educated person who has not, some night or other in the course of his life, after reading a captivating article in his favourite periodical, sat down with paper, pens, and ink before him, resolved to write something in the same manner, upon a subject which, to use his own phrase, has long been in his head. In general, however, the result of these attempts is only a heap of blotted and interlineated scraps, upon which, if you could gather them up and piece them together, you would find from thirty to forty initiatory sentences, and not so much as an attempt at a second one. The difficulty with these inexperienced gentlemen is how to begin—how to get language of sufficient emphasis to excite attention at first, and to be worthy of the mighty subject that is to follow. Accordingly, after spending a whole evening and half a quire of paper, and cutting down seven good quills in pure agony of spirit, they rise from their unfinished, uncommenced task, wondering what magic there can be in literary labour, and resolved to remain members of the *reading* public all the rest of their days.

The writer of the present little essay, at an early period of life, experienced all this difficulty in commencing his compositions; and if he had not been endowed with a rather uncommon share of perseverance, he would never have to this day written a *second sentence*. After toiling a long time in vain, I discovered [the reader must allow him to use the first person] a plan for obviating the difficulty, which, though I do not now practise it, was of service to me at the time, and may be so to others also. I adopted the project of making my opening clauses first—to strike the key-note, as it were—and then proceeding with my composition, just as reason should direct or fancy dictate. There was more rationality in this than some people may suppose. We are all more or less creatures of impulse; and it depends very much upon the way we begin any thing—the spending of the day, for instance—how we are to follow it out. My opening clauses were generally recollected from some book of essays formerly read; and it was amazing how cleverly my ideas ran, after these were once fairly set down on paper, and how suitable all the rest of the article was to the com-

* This anecdote is given by Dr Wardrop, of London, in his excellent Lectures on Surgery.

mencement, both in matter and in manner. When I began, for instance, with "It was the remark of an ancient Greek philosopher," the essay was sure to turn out very abstract and metaphysical, something like a paper in the Rambler. If my first line happened to be, "In the morning of life, when passion assumes the empire of our reason," then the article was sure to be a solemn preaching upon the absurdity of permitting love and all that kind of thing to beset us so dreadfully in youth. Sometimes I would open with, "It was a dark night in December, and the winds rattled through the deserted corridors:" then, of course, the work turned out a story in the Ratcliffe style, entitled a Romance of the Danube, the Rhine, or the Po, as the case might be. Perhaps I would set out with, "It is now three and twenty years since a farmer in the county of Norfolk, on going forth one morning to his fields, found a child suspended in its cradle at his door, with a paper pinned to its breast," &c.; in which case, the result was sure to be a novel in the manner of Anne of Swansea, that is to say, in five thin volumes, published by Messrs Newman and Company, at five and twenty shillings. Occasionally, the thing would go off thus: "Every one who has been in Paris must recollect a street leading from the Pont Neuf;" which generally answered for an article in one of the Annuals. I have sometimes dashed off as follows:—"Of all the subjects which have interested mankind for a century past, there is none which has more claims upon our attention than"—such and such a thing—no matter what it was—it was always sure to be shown up, in the approved manner of my contemporaries, as the most important thing on earth. Or it might be—"There is hardly any modern writer who has done more service to the cause of truth and morality than"—so and so—no matter who—he did well enough for the time. Among other styles which I attempted, was the plump-in style, thus—"'Death and destruction,' said the major, one morning as he descended into the breakfast parlour, where the family had already assembled, and was proceeding to the morning meal." This, of course, turned out a random Shandean sketch. Other beginnings I shall here set down in the manner of a list of proverbs, without troubling the reader with a specification of what kind of thing each led to—a matter which he will himself be able to imagine as accurately as I could pretend to inform him.

There are few things in life—One day in June—There is no sentiment more difficult to be understood than—Whatever may be said by philosophers—In that part of Spain which is watered—It is an apophthegm as old as the days of Solon—When the learned Scaliger was on his death-bed—Strange as it may appear—It has often been remarked—It has frequently been the subject of remark—We do not remember of ever having been more interested than on one occasion when—

In later times I have discovered that the difficulty of commencing an article lies in the absurd and unnecessary effort to have something very fine at the beginning, by way of introduction. A writer of little experience always thinks it indispensable that he should preface what he has to say with a few general remarks, which, however, so far from creating a favourable impression, or doing any other good, generally serve only to deaden the curiosity and spirit of the reader, if he do not indeed choose the wiser plan of passing them over altogether. The only judicious way of beginning an article is to begin at the place where the *matter in the mind* begins, assuming a simple demonstrative style, and leaving all comment and philosophising to the conclusion, when, if the sympathy or attention of the reader shall have been properly engaged, he will be disposed to pause and linger over what has given him so much pleasure, and not only read what is added in the way of remark, but will dwell fondly even upon the printer's name and colophon, and finally only lay down the document when not another word remains any where unperused.

BUTTERFLIES.

Who can behold the butterfly, without associating with it the delightful scenes of his childhood? We can remember, that, in our early days, these short-lived but beautiful beings of the sunbeams attracted our admiration, and were amongst the first of our treasures. Their existence was an enigma to us. How was it that we could never find them in a young state, so that we might watch their gradual progress to maturity? We were ignorant of the fact, that

> "Unconscious of a mother's care,
> No infant wretchedness she knew;
> But as she felt the vernal air,
> *At once* to full perfection grew.

Butterflies, like most other tribes of insects, undergo *four* distinct changes; that is, they exist in so many distinct conditions. We are unable to trace with certainty the purposes for which these separate states were destined by creative wisdom, and why they do not, like other animals, preserve the same general form from infancy to perfection. This, like many other of nature's mysteries, is hidden from mortal sight. One important office we know assigned to insects in their caterpillar state, is the destruction of redundant animal and vegetable matter in a state of decay; and few agents could be more effectual, for they are extremely voracious, and are provided with a stomach nearly the size of their whole body, endowed with such rapid powers of digestion, that they are capable of consuming an immense quantity of food.

We have said that butterflies undergo four changes: these are, the egg, the caterpillar, the pupa, and the perfect state with wings.

In depositing her eggs, the female butterfly has an unerring foresight, and always places them on the very plant on which nature has destined them to feed; for it is a remarkable fact, that almost all caterpillars have a particular plant allotted to them for food, and will seldom eat any other. When the eggs are extruded by the parent, they are enveloped in an adhesive cement, which fixes them to the spot where they are laid. If the caterpillars are such as live in societies, the female deposits her eggs in one spot; but if they are solitary, she places them on different plants.

When eggs are thus deposited by the female, they are not hatched by her care, as in the higher animals, but are left to be brought to perfection by the genial influence of the sun. In some species of butterflies, the eggs remain in that condition till the succeeding summer, while others are developed in a few weeks after they have been laid.

The intensity of cold which the eggs of butterflies can withstand, is truly astonishing; for it has been found, that, even after the most severe winter, their eggs have proved equally prolific with those which have been exposed to open winters. It was found, that, in the year 1709, celebrated for the intensity of its cold, and its fatal effects on animals and plants, that insects were as numerous in the spring as in any other season. The thermometer fell in that year to one degree of Fahrenheit's thermometer.

The celebrated Boerhaave, after this remarkable year, was desirous of ascertaining what degree of cold the eggs of insects could bear, without destroying the vital principle. He prepared a mixture of rock salt and nitrate of ammonia, and reduced the thermometer to twenty-three degrees below zero, and, after subjecting the eggs to this rigorous treatment, he found that they were hatched in their due season, and that the caterpillars were as strong as those produced in the mildest seasons. Boerhaave found that the contents of the eggs, at this low temperature, remained perfectly liquid; while insects themselves were killed at fourteen and sixteen degrees, and their members became as hard as ice.

Spallanzani observes, regarding this remarkable phenomenon, "If eggs do not freeze, it is probable that the included embryos do not freeze. Is there any thing surprising, therefore, that they are capable of resisting that cold which proves fatal to their contained insect when produced? Perhaps, for the same reason (and I can perceive no applicable objection), animalcula concentrated, or in the germ, can support a degree of cold which they are incapable of enduring when emerged."

It may be asked, as the temperature of freezing still retains a portion of heat, why should it not develope the germs of the most minute animalcula? If we had never seen any eggs hatched but those of birds, which require one hundred and four degrees, we should have naturally concluded that all others required the same. A slight knowledge of the physiology of minute animals, instructs us how many kinds produce at a much lower temperature. The eggs of butterflies, and many other insects, hatch at a temperature so low as forty-five degrees. If these eggs emerge at fifty-nine degrees lower than is required for the hatching of birds, what difficulty can we have in believing, that, at thirteen degrees less than the freezing point, other animals are capable of being hatched? Nor should I be surprised at being told that there are animals whose eggs would hatch in a much greater degree of cold, after being aware that there are plants, which are beings so similar to animals, that flourish amidst the regions of winter, and even fructify."

The eggs of butterflies are subject to great variety of form, according to the species by which they are produced. They are for the most part externally ornamented with a variety of beautiful figures; while others are ribbed in a variety of ways, others scaly.

When the egg has remained its appointed time in that state, it bursts, and the caterpillar or grub starts into life. At first it is extremely minute, as may well be supposed from the smallness of the egg from which it has emanated. They, however, go on rapidly, and reach a great size, in proportion to their original dimensions. The caterpillar of the goat-moth, when it has attained its full size, is seventy-two thousand times heavier than when it leaves the egg.

As we before observed, caterpillars have most voracious appetites, for they generally consume double their own weight of leaves daily. The reason of this is, that their stomachs have not the power of dissolving vegetable matter, but merely the faculty of extracting the juice. The rapid growth of the animal occasions it to change its skin several times before arriving at maturity.

When the caterpillar has reached its full size, it soon afterwards ceases to eat, becomes very restless, seeks for a place of retirement, wherein it may undergo another of those changes destined by nature. It begins to spin some web or covering with exquisite fine silken threads, which it has the power of drawing from its mouth. When it has accomplished this task, it ceases from its toil, becomes quiescent, and prepares for its metamorphosis into the pupa condition; the body contracts considerably, its skin splits once more, and discloses a uniform mass, without exterior eyes, mouth, or limbs. The term pupa was employed by Linnæus, because the animal, when in this state, has the appearance of being concealed under a mask resembling a mummy, or a child wrapt in swaddling clothes, as practised by the Laplanders.

In this state the animal continues motionless, suspended by a silken thread to the under side of a leaf or other substance, without any sort of nourishment, and in this death-like casement, only gives indications of life by a slight motion after being touched. The duration of its pupa condition depends upon the species. Some are only in this form for a few weeks, while others remain in the pupa state till the succeeding summer. At the appointed time, the casement bursts, and the perfect insect emerges in all its beauty and perfection, expands its nicely-folded wings, and prepares for flight. This is the peacock butterfly, one of the most beautiful of our British insects which we have traced through these remarkable metamorphoses. This insect, like various others which are allied to it, when it takes its first flight, discharges a few drops of a reddish-coloured fluid, and sometimes of the intensity of blood, and which has occasioned many superstitious stories of showers of blood, as more particularly mentioned in No. 6 of the Journal, to which we beg to refer the reader.

Captain Brown, in his "Book of Butterflies," &c. makes the following observations on this curious subject:—"The transformations of insects, more correctly speaking, consist rather in a series of developements than in any absolute metamorphosis, being only a transition of changes in organs which lay concealed from human view, the caterpillar being compound in its nature, with the germs of the butterfly hidden in a succession of cases. The first is the covering of the *pupa*, which is concealed within three or four mantles, the one over the other; these will in succession enrobe the larva; and as it enlarges, the parts become visible, and are alternately thrown off, until the perfect insect emerges from its confinement. The celebrated Swammerdam found, by dissection, the skins of the caterpillar and pupa enveloped in each other, and also the butterfly with all its organs, but these in a fluid state. Malpighi discovered within the pupa of a silk-worm that was only a few days old, the eggs of the future moth; and Reaumur discovered those within the caterpillar of another moth, seven days before its change into the pupa state. Although these discoveries disprove all miraculous intervention, still we are wonder-struck on reflecting that this simple caterpillar, when first it emerges from the egg, not thicker than a thread of silk, should contain its own triple, or, in some cases, its octuple covering—the mask of a pupa and a butterfly, folded in the most astonishing manner over each other; and, besides these, different respiratory and digestive organs, a nervous system, and muscles of motion peculiar to each stage of its existence. It is inconceivable how these successive changes should be effected through the agency of the food which it takes into its stomach during the caterpillar state. And what is still more incomprehensible, is, that this stomach at one time is incapable of digesting vegetable food, the nectar of flowers being all it can contain. In this perfect condition (the butterfly state), it is deprived of the very organs by which it could feed on vegetable matter, and is supplied with a proboscis for sipping the honey. It is no less remarkable, how, at one period of its existence, it emits from that stomach a substance for the formation of silky filaments, which, in its butterfly state, it is incapable of doing."

In the caterpillar state it has sixteen legs, and only six in the butterfly condition; the jaws also are lost, which enabled it to masticate its food, and these are replaced by the proboscis; and it has now acquired the addition of two long horns or antennæ on its forehead, and the twelve eyes which it had in the caterpillar state are superseded by two, which are composed of at least *twenty thousand* convex lenses, each supposed to possess distinct and effective vision!

THE ART OF DRAWING.

(Concluded.)

To render instruction in the art of drawing as clear and simple as possible, it will be assumed that the learner for the first time looks at an easy object to sketch, and that he is desirous to render it a subject for a picture by the introduction of a few accessories. Suppose, on a gently rising ground, he sees two large stones placed on each other—a piece of masonry in ruins. If he place himself immediately in front of this object, it will appear a perpendicular parallelogram, standing on its smaller base. Suppose, also, that there are a few bushes on the left, a tree on the right, a little rising ground farther off, and the sea in the distance, this will be the most insipid of all the points of view; for the mouldings and inscription, if there be any, on the pedestal or lower stone, will be all horizontal lines, and there would be no other objects to assist in making it a picture. But if the learner change his position a little to the right, the ruin will exhibit two of its sides, the bushes will appear behind the ruin, contrasting their forms with the horizontal lines of the ruin and the distant sea; so that the subject will receive considerable improvement as far as such slight materials may be rendered interesting. Let this imagined scene be reconsidered with

reference to measurements, merely to assist in placing it before the eye more evidently.

The page of the sketch-book is nine inches wide; let the ruin stand one inch from the lower edge of the paper, two inches from the left edge, one inch and a half in width, and four inches high. This will determine the size and situation of the ruin, when exhibiting only one side. Let it be sketched with perpendicular lines on the sides, horizontal lines on the top, at the base, and across the middle, to give an idea of a moulding. Now, as by the change in position to the right, another side of the ruin becomes evident, the true direction of the lines necessary to show this side as it would appear in nature, are to be found thus. Suppose the learner, at his change of position, stood about three inches from the right edge of the paper, and on the lower edge, or base, he must determine on the horizontal line of the subject. This line is evident in nature when the ocean forms the back or most distant part of the prospect; it is always the height of the eye of the spectator. If he place his eye near the ground, the boundary line of the sea descends to that level; if he place himself on a hill, the line of the sea ascends to the level of his eye, and this line, called the horizontal line, exists in a view of whatever it may be composed. Therefore the height of the horizontal line may be fixed at pleasure. But it should be noticed that if it be low, or near to the base, the landscape will be very compressed; if it be placed high up, the landscape will be expanded in proportion, or what is called a bird's-eye view. There is a medium which must be regulated by the nature of the subject; about one-third from the base will avoid either extremes. Returning to the subject to be sketched: the *horizontal line* should be faintly drawn across the subject at the height determined upon, and on this line, immediately over the spot on which the spectator is placed, as determined by the change of position before mentioned, a dot should be made: this is called *the point of sight*, because it is the point into which the lines must be directed that regulate the diminution of that side of the ruin that recedes from the spectator.

Now, the ruin being sketched, as described, by two perpendiculars for the sides, and horizontals for the top, the mouldings, and the base or lower line of the ruin, the lines called *visual rays* must be diagonally drawn from the upper angle, from the moulding, and from the lower angle of the ruin, all to the point of sight, which will determine the descending top, the nearly parallel mouldings, and the ascending base line. It is then necessary to determine the width of that side of the ruin seen in perspective. A continuation of the surface of the drawing should be supplied by another book, on which must be drawn an extension of the horizontal line five or six inches. Now, the space between the eye of the person drawing and the paper, is perhaps about eight inches; it is the expanse of vision for this sized drawing, while the eye is on the point of sight; this space must be measured from the point of sight along the continued horizontal line, and a dot made there: this is the *vanishing point.* Now, a diagonal line drawn from that angle of the ruin at its base farthest from the point of sight, on the left, to the vanishing point just determined, will show the width of that side of the ruin seen in perspective; it is where the lines, drawn from the angles of the ruin to the point of sight, and to the vanishing point, cross each other; from this intersection of the lines, raise a perpendicular line to that which has been drawn from the top of the ruin to the point of sight, and the true perspective of the object will appear. All other lines to describe mouldings, inscriptions, &c., on the side seen in perspective, must be drawn to the point of sight. There is but one point of sight which is distinct from a vanishing point.

Perhaps at a first reading, accompanied by an attempt with the pencil, the process may fail from an apparent confusion of terms and directions; but you, the learner, should attentively consider every line before it is drawn, and then examine the effect intended, that you may feel convinced you are proceeding correctly, and be satisfied the principle rests on a certain foundation. If it should be the first attempt at drawing an object in perspective, two or three repetitions of the process are recommended, that the several lines and points may become familiar to the mind. By having a companion, who will have the kindness and patience to read the process carefully, and wait while the learner is applying the pencil, the knowledge of perspective will be greatly facilitated.

When all that relates to linear perspective has been completed, the lines of direction may be obliterated with Indian rubber. The ruin will then stand clearly defined. Then, proceeding to give a pictorial effect to a subject so simple, an irregular line, to represent the *foreground* on which the ruin is supposed to stand, may be drawn from the left towards the ruin, a little above its angle, and, as if passing behind, continued from a little above the other angle in perspective, drawn in an irregular curve towards the right edge of the paper.

Then an indication of a mass of bushes may be sketched, in forms rather circular and irregular, from the ground on the left ascending about two-thirds the height of the ruin, and continued on the other side of the ruin rather lower, but above the horizontal line, in circular and irregular forms, to the foreground, so that the ruin and the bushes may assume a pyramidical shape.

Then a mass of trees on the right, near the edge of the paper, projecting an inch or two on the subject, may be sketched in the manner of the bushes, much stronger, but not so high as the ruin, yet connected with the foreground, as conducive to effect. Then an irregular line, drawn from near the lower part of the bushes, ascending towards the trees, yet beneath the horizontal line, will give the *second plan* to the picture. The horizontal line will represent the boundary of the ocean, and give the *distance* of the picture. Thus will be arranged the constituent portions of a composition in outline—foreground, second plan, and distance.

The light and shade are next to be considered. The term light generally means that side of the subject whence it receives its illumination. *Light* particularly means that side of an object which receives the greatest portion of brilliancy or sunshine. *Shade* is that part of an object on which there is no brightness. *Shadow* is a degree of darkness occasioned by an object being on the ground, and opposed to the light. The application of these to our subject will teach their relative value, and show the unison of the rules of art with the effects of nature.

Let it be determined to illume our subject from the right: it then follows that the side of the ruin, seen in perspective, will be illuminated; the other side will of course receive some perpendicular markings with the pencil, to place it in shade; and from its base a shadow will be cast by strong markings to the left, in the diagonal direction which the sun would cast a shadow. The bushes will require to be shaded by a number of waving markings on the sides opposed to the light, which may be repeated, but with less power than was given to the shadow of the ruin. The ground, or the second plan, may be covered by wavings of the lead-pencil, but less powerful than the shade of the bushes. A few horizontal lines may be tenderly marked, to separate the sea from the sky. The trees on the right may then be waved in with that degree of power which shall give decision to their situation on the foreground, and opposed to the light: their shadows must be strongly marked in the diagonal direction, agreeing with the shadow of the ruin. Observe well that the degrees of power produced by waving of the lead-pencil, are in agreement with the gradations of remoteness—the foreground strong, the second plan less strong, and the distance feeble, so as to appear evidently one, two, and three degrees of aërial perspective.

This sketch should be repeated two or three times, with attention to the reasons for each line and each shade; after which, the learner will have acquired a knowledge of the terms and the process—a sure foundation on which to raise the hope of improvement.

JACK CASSADA,

A SKETCH OF THE WAYSIDE.

WALKING one day in the vicinity of London, I was driven by a heavy shower of rain to take shelter in a public-house of the better order. I found in the coffee-room three young men who had been driven in by the storm; two were laughing at the third, in consequence of failure in some enterprise.

In the midst of their hilarity, an elderly gentleman entered, and seated himself opposite to me. He occupied himself in wiping his coat with his handkerchief, and looking at the clouds which continued to pour out their heavy drops. He ordered brandy and water, glanced at me, looked at the noisy party, and turned his face from them so as to present his profile to my view. His head was cast in a fine mould, it was like the bust of Franklin, but rather thinner; the forehead was particularly good—little hair, and that silvery.

I sat contemplating his features, and associating them with a powerful and benevolent mind, when, by raising his liquor to his mouth, the shaking of his hand caused a few drops to be spilled on the table between us. He apologised for the accident caused by his infirmities. I entreated him not to think he had incommoded me. He remarked that he was furnishing me a proof that he had lived sufficiently long. I replied that I could perceive no such evidence. He spoke of his fast impairing faculties; that he had ceased to be worthy of any one's regard; thus situated, he grew weary of the sameness of every-day occurrences; that he felt like a leaf quivering on a naked branch in an autumnal eve; the night-wind comes, the leaf drops, and mingles with the earth. "When," said he, "all the world can offer has been enjoyed, when nothing is left to anticipate, is it surprising that an old man should willingly resign a lingering existence?" I endeavoured to brighten this view, by expatiating on the charms of nature, and the value of his long experience. He smiled, admitted the former, but denied that he possessed ought worth communicating; for that he was often indebted to younger men for precepts and examples; that he did not think man was entitled to respect merely because he had lived a number of years; it should be rendered to his usefulness, not his grey hairs.

The young men in the room here broke in with some rude observations, but they failed in the intention of irritating the old gentleman. Turning from them with placid indifference, he continued his conversation with me. He said that he had seen some service in the navy; that he had resided for fifteen years in the West Indies, and now intended to remain in London until the time came for him to lie down in peace. I strove to relieve his mind from a gloom which every now and then came over him with increasing effect. He heard with attention all I could offer, and replied with calmness, as if willing to take comfort; yet his remarks ever led to the conclusion, that a solitary individual might desire to die. He had done with the world, and the world had done with him; therefore the grave was a retreat best suited to one so forlorn.

We were sitting in melancholy reverie, when a stage-coach drove up to the door. The fellow in attendance, with a large bugle-horn, blew a loud and discordant blast into the ear of a negro sailor who was passing. He started, and asked why that was done? He was told, to teach him music. The youngsters in the room, and the blackguards outside, were much delighted with this. I opened the window; the old gentleman looked out to see if the weather were likely to be fair. Seeing the negro surrounded by persons treating him unfairly, I spoke to the coachman, of whom I had some knowledge, requesting him to interfere. The negro came to me at the open window, and said, "Tank you, sir. Too many for one." The coach drove off, and the party became silent.

I asked the negro where he came from, and how long he had been in England. He told me he had been eighteen years at sea, and that he came from Antigua. The old gentleman said something which I did not understand, to which the negro replied, "Yes, sir." I resumed my seat, pleased that something had occurred to dissipate the old gentleman's melancholy. "Well," continued he, "did you work on board a drogger that carried sugar round to Saint John's?" "Yes, sir." "What became of that vessel?" "Carry too much sail, so capsize in Willoughby Bay, sir." "Come in," said the old gentleman. "This is extraordinary! I know this man, sir," addressing himself to me; "I have reason to know him."

The waiter endeavoured to prevent the negro from entering the coffee-room. The old gentleman rang the bell, and requested his friend the negro might be admitted. He came, twisting the rim of his hat round and round, while he gazed at the old gentleman. "Eh!" exclaimed he, "Jack Cassada berry glad"—— The waiter expressed uneasiness at the negro's being there, which the old gentleman perceived, and requested grog to be brought, his countenance brightening into benevolence. "Had you been rich, Jack, your nose would have been Roman, your lips Georgian, your complexion lilies and roses." "Ah! sir, dat berry true," said Jack; "I tink say now you"—— "Yes, yes," interrupted the old gentleman, "we know each other well." Taking a card from his pocket-book, and giving it to the negro, he said, "Go to that address this evening at eight o'clock. Waiter! put on that table the roast beef I saw in the larder; my friend will dine." Jack passed his hand over his head, and tugged up the waistband of his trousers, while all was prepared for him.

This proceeding gave great offence to the youngsters, whose clamour had softened into expressions of contempt, till one of them, unable to repress indignation, said, "However excellent may be the charitable intention, it is not respectful to the gentlemen present that you should feed a negro beggar in a room not appropriated to such exhibitions." The old gentleman sat unconcerned, while Jack paid his respects to the beef. The youngster continued: "I address myself to you, sir—you," exalting his voice, "you, sir, whose age should teach something superior, but your conduct reduces you to the level of the being you are ostentatiously feasting." The old gentleman turned to the speaker, his eye lighted up with an extraordinary brightness, while a smile of affability pervaded his countenance; "Did I not hear you remark, sir," said he, "that this room was appropriated to gentlemen? How, then, by the terms of your remonstrance, can you render that assertion doubtful? You are silent. If caused by reflection on the injustice of your attack, I will atone for the rebuke I have offered." "Sir," replied the youngster, "I am considering which I shall do first—pull your old nose, or kick your sable cormorant out of the room." "This," said the old gentleman, "is the impetuosity of youth, expressed without an intention so to act." This was wormwood to the youngsters; they received it as despising the threat to use brutal force. They looked at each other, grew pale in the face, and talked louder, as if to call their courage up. Jack occasionally glanced his full eye at them, looked serious, but finished his hearty meal.

"Have you dined?" said the old gentleman. "Yes, tank you, sir," replied Jack; "Eh! just te ting; all dis make me tink o' long time ago, sir." The youngsters continued to express their dissatisfaction; unwilling to go, yet loath to remain, they made some reflections on Jack that were painful to his feelings. "Yes, young gemmen," said he, "he black, but he no like de debil, and he no hab white fedder in de tail; so put dat in your pocket." One of the youngsters called him an insolent rascal. "Eh!" said Jack, "dere more dan one in de room." The old gentleman smiled at Jack's remarks, and asked me if I had any objection to the presence of his negro acquaintance. I replied not the least, but that I was pleased to find he could be interested in the circumstance. He looked a thankfulness that language would fail to convey.

Notwithstanding my desire to be in town, I was held, as if by magic; my curiosity had been strongly excited by the old gentleman's change of manner on the discovery of the negro, and I felt desirous to learn the cause. The youngsters affected to treat all of us with contempt, yet continued to utter sarcasms of the grossest kind on poor Jack. Each of them had taken so much of the gentleman into his elevated character, that they could no longer think of acting as they had proposed. They therefore deputed the waiter to kick the black rascal into the street. The waiter smiled, while the old gentleman hoped his friend was not to be thus treated on account of his colour; during which, something was said by one of the youngsters, that pressed so hard on Jack's feelings, that he appealed to the old gentleman. "Oh," replied the old gentleman, "never mind what they say; the tongue is an unruly member." "Berry good, sir; day hurt noting we day flash in de pan." At which, the most violent of the trio sprang like a lion on Jack, and gave a sharp hit or two, in a pugilistic style, before Jack could clear for action. But the negro stood out, and gave such a tremendous repetition of blows on the aggressor's face, that he fell as if a horse had kicked him, bleeding profusely. "So," said Jack, "dat unship you bowsprit, an splinter you figure-head." The other gentleman would have picked their friend up, for a regular set-to, but he declined having any more of Jack's right and left hard-hitting.

The scuffle brought in the waiter, who, though uneasy at what had occurred, said he thought how it would terminate. Water and towels were brought, the fallen hero was cleansed, and, as it is said, made fit to be seen. He, however, appeared with a nose twice its former size, of which he convinced himself by frequently feeling it; and his eyes were, as the waiter expressed it, "buttoned up tight." All this was distressing; the old gentleman was much concerned; but the past could not be recalled. A piece of raw beef was applied to each eye of the wounded man, and, one on each side of him, the trio made their exit.

It was a transition from turbulence to tranquillity, in which we rejoiced. The waiter was asked by the old gentleman, who and what were the persons just departed? "They are," replied the waiter, "the sons of very respectable gentlemen in the neighbourhood. The wounded one has a situation under government, which I think he pays little attention to, for he is quite a sporting man, and in their seasons is engaged in cricket matches, shooting, racing, rowing, and dog-fighting. Some persons say he is a very good one with his fists. I was surprised to see him give in so readily. But I guess he did not like the idea of receiving another such a facer; they make a gentleman look most confoundedly queer." Jack repeated the term gentleman. "Eh, he tink he berry grand; but he nebber gentleman."

I could perceive by Jack's perfect composure that he felt he had upset a bully, and that he had revenged the insolence the old gentleman had received. A glass of rum-grog was placed before Jack; he rose, and bowed most respectfully to the old gentleman, who requested him to be seated, and candidly tell how he came here. "Ah! sir," replied Jack, "shame to tell. You make Jack free, you pay for him freedom, and Jack hire himself out, but get tire of Antigua, so go in Merica brig to New York, den go in ship to Canton, make good trib back, den come to England. Eh! nebber see de day so happy—ebbery ting go well, so go in Company ship to Canton again, come home, so paid off, stay in Wapping, an get rob all to noting." "Sailor like," said the old gentleman. "Where were you stationed on board the Indiaman?" "On forecastle, sir," replied Jack. "Last trib make to Smyrna, in merchant ship—all just de ting: come home—go to old quarters in Wapping—so now look out for ship." "Ay! I see," said the old gentleman. "I thought you were not skulking like a long-shore lubber." "No, sir," said Jack. "Then," continued the old gentleman, "all is right. Have you any shot in the locker?" Jack, smiling, showed a few shillings. The old gentleman gave him a sovereign, saying, "Get yourself a hat, in place of that tarpaulin castor, and come as I have directed." Jack, bowing, said, "Bless you heart, sir," and left the room, with a tear stealing down his cheek.

"There, sir," said the old gentleman to me, "you heard that poor fellow run over several transactions of his life without glancing at the circumstance of his having preserved me in the hour of peril. When the drogger was wrecked in Willoughby Bay, Antigua, that man swam with me, after I had lost all consciousness of existence; he bore me safe to shore, and now he sheds tears of gratitude on my giving him a piece of money. You see, sir, there is truth and courage in his composition." Then with emotion he exclaimed, "That negro is a man, in the best acceptation of the word Man." "Most sincerely," said I, "are you congratulated on the circumstance of your thus meeting the man who had saved your life. You have now the means to reward him as your heart dictates, in proof that it was worthy to be preserved. This also shows that life is not so wanting in all that may be in the highest degree gratifying. I perceive your intentions, sir, and I respect your feelings. I shall remember this hour to the latest of my existence, since I have been taught the value of a good deed. The services that one man may render another, is indeed bread, cast on the waters, that returns after many days.'" "You are right," said the old gentleman; "it is so."—I bade him farewell, while he was cogitating in which way he could render the most beneficial services to his preserver, Jack Cassada.

UTOPIA.

INGENIOUS men have at different times conceived to themselves the idea of a *perfect republic;* that is, a state or system of government which should provide for the happiness and improvement of the people in as complete a manner as human nature will allow. All of these have been ingenious theories, contrived without attending to that very wide experience which makes the perfecting of a government the work of many generations. Some of them have, however, attained much celebrity, and, among the rest, none more than that which was published by Sir Thomas More, under the name of *Utopia*. The author was Chancellor of England in the time of Henry the Eighth, and was a man of the highest and most honourable character. The elegance with which he propounded his benevolent but fanciful scheme, has made the name of his imaginary republic, Utopia, to be adopted in our language as a current expression to denote any plan which is founded on too favourable views of human nature to be practicable. Imagining that our readers may be curious to know the views of a man of so much celebrity, and to contrast them with the sounder doctrines which in many cases have been established from experience since his time, we have made the following abstract from the original Latin work. We give the story, as it were, in miniature, adopting the same style as the author himself, condensing his statements or abridging them, but leaving out nothing which is necessary to give an idea of the fancied commonwealth of Utopia. It is right to mention, that somewhat of the interest of the original work depends upon certain philosophical digressions, as well as on many adroit satirical strokes at existing institutions, in which it resembles Dean Swift's voyages of Gulliver. These of course are omitted, as not essential to the principal design of the author. We need only add, that the work was written shortly after the discovery of America, in which the country of *Utopia* is supposed to lie somewhere south of the line. The impression the work created at the time was so powerful, that many even of the learned believed the whole to be a real history.

"I had been sent (says the author) to Flanders, as ambassador, in charge of some business which remained to be settled between King Henry and the Emperor Charles the Fifth. While waiting at Antwerp, I one day observed a friend of mine in conversation before the great cathedral there, with a stranger, somewhat advanced in years, whose sunburnt countenance, and long beard, with the careless manner in which his cloak was thrown over his shoulder, gave him the appearance of a seafaring man. When my friend saw me, he detained me a little as if to speak with him, and said, without being overheard by his companion, "I was just thinking of bringing this person to your house." "He would have been welcome, on your account," I answered. "Yes," replied he; "but more for his own sake, if you knew him properly. There is not an individual now alive who has travelled farther, or seen more extraordinary things, than he has done; and he is, besides, well acquainted with most kinds of learning, so as to make his observations of some value." I begged to invite him to accompany us to my lodgings: he went with us accordingly; and, seating ourselves on a bank of green turf in the garden, we entered into conversation concerning his travels. It appeared that he had been in many foreign countries, and was a man well acquainted with the ancient philosophy. He had accompanied Americus and his companions, in order to gratify his thirst for knowledge, and for observing the manners and institutions of these new nations.

He told us, that, after the departure of Americus, he and five companions who were left with him in the fort, began to use every effort to become acquainted with the people of the country, and that they at last so far won upon their good will, that one of the chief men supplied them with provisions and boats, for making expeditions to such places as they wished to see. He gave them a guide also, to recommend them to persons of influence on their journey; so that they travelled without molestation, and visited many strange towns and cities, several of which appeared thriving places, and by no means ill governed.

Among other countries through which the travellers passed, there was one which appeared particularly worthy of attention: this was an island situated not far from the mainland, and called the Utopia, from an old chief of the name of Utopus. The island was about five hundred miles long, and about two hundred in the broadest part; but it lay in the form of a crescent, bent together at the ends, which were narrow, and not more than eleven miles apart; so that there was a large bay of the sea, as it were, in the very centre of the country. The entrance to this vast natural harbour was, however, obstructed by rocks, and hardly safe to any except natives, who were acquainted with the landmarks in view. The other side of the island had a number of harbours; but the coast, being generally rocky, the roads leading from them into the country were steep and difficult. There are in the country twenty-four large towns, all magnificently built and spacious; the situation of each is chosen so like that of the rest, that, in the very arrangement of their streets, and their general appearance, when you see one, you have a complete idea of all the others. The same language is spoken over the whole island; and the laws, institutions, and manners of the towns, are similar throughout. There are none of them above a day's walk from each other, and several only about twenty-four miles. The chief town is Amaurotum, which has been chosen, on account of its central situation, as being convenient for the general meeting of deputies, of whom three are chosen from each town, generally men of some age and of experience in business, for deliberating on the public affairs. The cities are so situated that each has a large country district lying around it, which is well stocked with farm houses, and all the materials of a thriving husbandry. The land is cultivated by the town's-people themselves, who take it in turn, one set going to labour in the country while another remains at their occupations in the town.

The cultivators are arranged while in the country into families of forty free persons, and two slaves; with each family there is an elder and a matron of respectable characters; and over every three hundred families there is an officer called a Phylarch. Of the forty persons who compose a family, twenty return each season to the town, and are replaced by twenty others sent from thence; so that each person remains on the farm two years together, where by this means there is always a moiety acquainted with country labour, and able to instruct the others; numbers, however, request to remain a longer time, from the pleasure they take in farming and field-work. Their business is to attend to the crops, to rear domestic animals, and to prepare wood, and take it to the towns. They rear immense flocks of chickens, which, however, they hatch not in the usual way, but by the heat of an oven, a process in which they are very expert and successful. They raise corn for bread only, not for brewing or distilling; and for drink they have the vine, as we have, as well as the liquor of apples and pears. In laying out their land, they calculate how much corn, meat, and other produce, will be wanted for a city and its dependent territory, and take care always to have a much larger quantity than is necessary, that after each district has supplied its own demand, they may be able to afford a portion in any quarter where there may be a deficiency. Whatever articles of the manufacture of the towns are wanted, the cultivators receive them on demand, without offering any thing in exchange and when the crops are ready for harvesting, the country phylarchs, or overseers, give notice to the authorities in the towns, when the whole population is set to work, and the crops are secured almost in a single day.

A description of the city Amaurotum will give a complete idea of all the others, which are as exactly like each other as may be. This place, then, is situated on a gentle slope, with a river flowing along the bottom of the declivity which is navigable, with the waters of the tide, as far as the town; and there is a stone quay all along the bank, at which vessels lie to for delivering their cargoes. The town is of a square form; the streets long and straight, with a row of well-built houses on each side, before which there is always a paved footpath; in the rear, every house has a garden with a door opening into it. The doors, both in the front and behind, are made in such a way as to open readily with the hand, and to shut again of their own accord; but they are never locked, so that no one has any place of secrecy. They pay the greatest attention to their gardens, in which they raise abundance of the finest fruits, flowers, and herbs. Nothing can be more splendid or useful than the treasures of vegetable beauty exhibited there; and the founder of the town seems to have paid particular attention to the laying out of the gardens, which the successive generations of inhabitants have continually improved.

With regard to their magistrates, every thirty families in the towns elect yearly a representative, who is called a Syphogrant; and to every ten Syphogrants with their constituencies, there is an officer or representative, who is styled a Tranibor. Lastly, the whole of the Syphogrants, who are two hundred in number, after taking an oath to select the most useful candidate, choose by secret votes a chief magistrate, who is always one of four, of whom a list is given them by the people, each quarter of the city naming one. This chief retains his office during life, except there be reason to suspect his aiming at arbitrary power: but the Tranibors and all the other officers are elected yearly. The Chief meets with a council of the Tranibors every third day, or oftener, if there be occasion, to deliberate on public business, or the suits of individuals; and there are always two of the Syphogrants (or inferior representatives) present. It is a capital crime for the magistrates or chief to discuss public business any where except in the senate or great assemblies; a regulation which is enforced, that the authorities may not conspire in secret against the public liberties. In matters of great moment, a communication is made to the Syphogrants, who consult their families (constituencies), and give in their opinion to the senate.

All the people are acquainted with farming, which they learn from their infancy, partly by instructions in the schools, and partly from practice, when their families are in the country. Besides this, every one is taught some other business—such as weaving, carpentry, or smith-work; and these constitute the most of their crafts. There being little variety of dress used in the island, except that those of the men and women are different (and both of them are very becoming), each family makes their own clothing. But of the other businesses, every person, male or female, learns some one, the women generally performing some of the lighter portions of the work, and every person for the most part following the profession of his ancestors. Their labour is not heavy; for if the day be divided into twenty-four hours, there are only six of these devoted to work, three in the forenoon, and three in the afternoon. All the remainder of the time they have at their own disposal, not for idleness or dissipation, indeed, but for any rational amusement, such as reading, or hearing lectures on various subjects, delivered by persons who make literature their business. It may be supposed that, if they labour only six hours a-day, they must be very poor, and that the country will be ill supplied with every thing—but this is far from being the case; and the few hours which they devote to work are quite sufficient to procure all that is wanted for the necessaries and comforts of life; of which you may be convinced, if you have remarked in other countries what immense multitudes of people go entirely idle, and produce nothing; or what a vast number, again, are employed in arts which are mere luxury and superfluity, or which injure the community instead of benefiting it: and yet these idle people and triflers consume much more of the labour of others than those who exert themselves to produce something really useful. In Utopia, on the other hand, there are but a very few persons in each city who are not employed in useful labour; even the Syphogrants themselves (though exempt from working by the law) give what time they can spare from the public business to some profitable occupation, that they may afford an example to others. Students, who have been selected by the Syphogrants and priests, and approved by the people, in order to follow the pursuits of literature, are exempted from manual labour; but if any of them disappoint the hopes entertained of him, he is returned to his work: and, on the contrary, any tradesman, who in his leisure hours displays a talent for learning, is admitted into the class of students, and enjoys all their privileges. It is only from this class that ambassadors, priests, the senate (or Tranibors), and the chief magistrate, are selected.

Another circumstance contributes to the abundance of every thing useful in Utopia; which is this, that no more labour is employed upon any matter than is necessary to make it useful. In other countries, the pulling down, remodelling, or rebuilding of houses, which have no fault but that they do not please the heir of the person who originally built them, occupies an immense number of workmen: among the Utopians, however, such waste of labour would be held ridiculous. In respect to dress, also, each person, while at work, wears a suit of clothes made of leather, or other stout materials, which will last for several years; and when they go abroad, they wear an upper garment, which is every where of the same colour and fashion; so that the only attention required for their clothes, is, to keep them clean, and in good repair. That waste of labour which is elsewhere expended upon the changing of fashions and different colours of dress, is never wanted in Utopia; and no one would either feel himself more comfortable, or be more esteemed by his neighbours, by having those endless changes which occupy so much idle time and expense in other countries.

I must now tell you about the way in which they carry on their intercourse with each other, and how the labour of one set of tradesmen procures them the necessaries which are manufactured by others. The whole people, as I mentioned, is divided into families, or small clans: and I should add, that, when marriages take place between members of different clans, the females (who are not allowed to marry till the age of twenty-two) leave their own, and live with that into which they are married; while the sons (who must not marry till twenty-six) remain in the paternal family, under charge of the oldest surviving parent: no family, however, is permitted to have more than sixteen members, or fewer than ten. The city being divided into four quarters, there is a market-place for each: to this rendezvous every family brings the produce of its labour, for each species of which there is a separate storehouse. At the same time that they thus deposit what they have produced, they take away with them what they have occasion for at home; and there is no danger that they should either bring too little, or take away too much. Why should they be indolent when they have so little labour? or rapacious, or greedy, when they know that there is abundance, and to spare, for all?

Through the different parts of the town there are public halls, where the inhabitants eat together, every thirty families having a common table. They are summoned to their meals at stated hours by a trumpet or conch; but every person has liberty to eat at home if he pleases—a permission of which very few avail themselves, since the dishes at the public table are prepared by far more skilful cooks than they are themselves. The old and young are intermingled together at table, so that the latter may hear and profit by the conversation of their seniors. For the sick there are public hospitals in pleasant airy situations without the walls, where they are nursed with all care, and where every person is sure of meeting with more attention than he could command at home, so that no one is reluctant to go and reside there while affected with any disease.

The Utopians have but a small number of laws, society being so regulated among them by their excellent customs, that a very few are sufficient to preserve order. They think that there is nothing more absurd among other nations than the innumerable multitude of volumes which are occupied with laws; and they ask with great reason, how can people obey rules which are either so obscure that no one can understand them, or so numerous that they cannot be read? With regard to their own laws, they think them useless if they seem obscure to the dullest peasant; and none but the plainest and most obvious meaning is admitted, all subtle and refined interpretations being cast aside.

They never make war but for some gross injury done to themselves, or, more especially, to their allies; but they carry on their hostilities in a very singular manner. An Utopian general would gain no credit by a bloody victory, however complete: if he cannot overcome his enemies by stratagem and artifice with little loss of lives, he is reckoned an unskilful commander.

There are different kinds of religion in Utopia: sometimes there are even different forms of worship in the same city. The sun is adored by some, and by others the moon; while a third class pay adoration to some of the planets, reckoning these as in some sort images or representatives of the Deity. When they were informed by us of the nature of the Christian religion, it is impossible to conceive the eagerness with which many among them listened, and made inquiries. A goodly number became Christians, and no one belonging to the old religion offered the least hindrance or obstacle to any of the converts. I recollect indeed no instance of any person being molested on account of his religion, it being an ancient law in the state of Utopia, that no man's religion shall be made a reproach to him.

The stranger recounted to us a number of other circumstances regarding Utopia, which cannot be mentioned now. I was much inclined to dispute the propriety of a number of the regulations of the community, which appeared to me exceedingly absurd; such as their mode of carrying on war, and some of their ideas as to religion; but more especially that which seemed the key-stone of the whole, their custom of possessing all things in common, and prohibiting the use of money—two regulations which would overthrow, according to the common opinion at least, every thing which makes the splendour and power of a commonwealth desirable to its subjects."

THE CONDEMNED SOLDIER.

[By the Author of "Stories of Waterloo."]

In our days the high-born and the wealthy have small inducement to violate the salutary restrictions of the law. However the moral code may be infringed, the criminal one is respected. In breaches of privilege and honour, aristocratic delinquency is chiefly comprised, and loss of character and caste the severest penalty incurred by the offenders.

There are, however, within our own recollection, some melancholy exceptions to be found. Men of superior rank have occasionally presented themselves as criminals; and as the well-being of society demands, the impartial hand of justice visited the offence with unmitigated severity.

Of the few unhappy cases, *one* will be remembered with lively regret. For no crime were there more apologists—for no punishment more general sympathy—and while his sentence was accordant to the letter of the law, the sternest ethic lamented that justice required a victim like Major Alexander Campbell.

This unfortunate gentleman was the descendant of an ancient family in the Highlands. Having entered the army at an early age, he served abroad under Sir Ralph Abercrombie, and in Egypt had particularly distinguished himself. He was transferred to the 21st Fusileers from a Highland corps, and his promotion to a brevet majority, it was said, had given offence to the senior captain of the regiment. Certain it is, that between these officers no cordiality existed—little pains were taken to conceal a mutual dislike—frequent and angry altercations took place, and the temper of Campbell, constitutionally warm, was often irritated by the cool contradictory spirit of his unfortunate victim.

The 21st regiment was quartered in Newry when the half-yearly inspection occurred. As senior officer, Major Campbell commanded on that occasion. After dinner, in the course of conversation, Captain Boyd asserted that Campbell had given an order incorrectly on parade. A hot and teasing argument resulted—unfortunately that evening the mess table had been deserted for the theatre, where the officers had patronised a play, and the disputants were left together at a moment when the presence of a judicious friend might have easily averted the catastrophe. Heated with wine, and exasperated by what he conceived a professional insult, Campbell left the table, hastened to his apartments, loaded his pistols, returned, sent for Captain Boyd, brought him to an inner mess-room, closed the door, and, without the presence of a friend or witness, demanded instant satisfaction. Shots were promptly interchanged, and in the first fire Boyd fell, mortally wounded. The dying man was removed to his barrack-room, and Campbell hastened from the scene of blood. The storm of passion had subsided, and the bosom of the wretched homicide was tortured with unavailing remorse. In a state of mental phrenzy he rushed to the chamber where his victim lay, supported by his distracted wife, and surrounded by his infant family. Throwing himself upon his knees, he supplicated pardon, and urged Boyd to admit "that every thing was fair." The dying man, whose sufferings were intense, to the repeated entreaties of his opponent, replied, "Yes, it was fair—but, Campbell, you are a bad man—you hurried me," and shortly afterwards expired in his wife's arms.

When the melancholy event was communicated, at the solicitation of his friends Campbell left the town. No attempt was made to arrest him, and he might have remained in partial retirement had he pleased. But his high spirit could not brook concealment; and, contrary to the entreaties of his family, and the opinion of his professional advisers, he determined to risk a trial, and in due time surrendered himself, as the summer assizes were approaching.

From the moment the unfortunate duellist entered the prison gates, his mild and gentlemanly demeanour won the commiseration of all within. The governor, confident in the honour of his prisoner, subjected him to no restraint. He occupied the apartments of the keeper—went over the building as he pleased—received his friends—held unrestricted communication with all that sought him—and, in fact, was a captive but in name.

I shall never forget the 13th of August 1808. I arrived in Armagh the evening of the major's trial, and when I entered the court-house, the jury had retired to consider the verdict they should pronounce. The trial had been tedious—twilight had fallen, and the hall of justice was rendered gloomier, if possible, from the partial glare of a few candles, placed upon the bench where Judge Mayne was seated. A breathless anxiety pervaded the assembly, and the ominous silence that reigned through the court was unbroken by a single whisper. I felt an unusual dread, a sinking of the heart, a difficulty of respiration, as I timidly looked round the melancholy crowd. My eyes rested on the judge—he was a thin bilious-looking being, and his cold and marble features had caught an unearthly expression, from the shading produced by an accidental disposition of the candles. I shuddered as I gazed upon him, for the fate of a fellow-creature hung upon the first words that should issue from the lips of that stern and inflexible old man. From the judge my eyes turned to the criminal, and what a subject the contrast offered to the artist's pencil! In the front of the bar, habited in deep mourning, his arms folded across his breast, the homicide was awaiting the word that would seal his destiny—his noble and commanding figure thrown into an attitude of calm determination, was graceful and dignified—and, while on every countenance beside a sickening anxiety was visible, not the twinkle of an eyelash, or motion of the lip, betrayed on the prisoner's face the appearance of discomposure or alarm. Just then a slight noise was heard—a door was softly and slowly opened—one by one the jury reluctantly returned to their box—the customary question was asked by the clerk of the crown, and—*Guilty*, was faintly answered, accompanied with a recommendation to mercy.

An agonizing pause succeeded—the court was silent as the grave—the prisoner bowed respectfully to the jury—then, planting his foot firmly on the floor, he drew himself up to his full height, and prepared to listen to his doom. Slowly Judge Mayne assumed the fatal cap, and, all unmoved, he pronounced, and Campbell heard his sentence.

While the short address that sealed the prisoner's fate was being delivered, the silence of the court was broken by smothered sobs; but when the sounds ceased, and "Lord have mercy on your soul" issued from the ashy lips of that grave old man, a groan of horror burst from the auditory, and the Highland soldiers who thronged the court ejaculated a wild "Amen," while their flashing eyes betrayed how powerfully the fate of their unhappy countryman had affected them.

Nor did the result of his trial disturb the keeper's confidence in the honour of the condemned soldier. On his return to the jail, an assurance that he would not escape was required and given: and to the last, Campbell continued to enjoy all the comfort and liberty the prison could afford.

Meantime, strong exertions were made to save him—petitions from the jury, the grand panel of the county, and the inhabitants of Armagh, were forwarded to the Lord Lieutenant. But the judge declined to recommend the convict, and, consequently, the Irish government refused to interfere. A respite, however, was sent down, to allow the case of the unfortunate gentleman to be submitted to the king.

The mental agony of Campbell's attached wife was for a time severe beyond endurance, but by a wonderful exertion she recovered sufficient fortitude to enable her to set out in person for London to throw herself at the queen's feet, and implore her commiseration.

To cross the Channel before steam had been introduced was frequently tedious and uncertain, and when the lady reached the nearest point of embarkation, her journey was interrupted; a gale of unusual violence was raging, and every packet storm-stayed at the other side. She stood upon the pier in a state of exquisite wretchedness. The days of that being whom she loved best on earth were numbered, and to reach the seat of mercy was forbidden! The storm was at its height—a mountainous sea broke into the harbour, while a crowd anxiously watched the progress of a fishing boat, which under close-reefed canvass was struggling to beat up to the anchorage.

The success of the little bark was for a time uncertain. The spray flew in sheets over the mast-head, and frequently shut the vessel from the view of those on shore. But seamanship prevailed—the pier was weathered—and amid the cheers of their companions, and the caresses of their wives, the hardy crew disembarked.

At that moment the sorrow of the lady attracted the notice of the crowd, and it was whispered that she was wife to the unhappy convict, whose fate even in that remote spot had excited unusual sympathy. An aged fisherman stood near her, and Mrs Campbell inquired "if the weather was likely to moderate?" The mariner looked at the sky attentively, and shook his head. "Oh God! he will be lost," she murmured. "Could I but cross that angry sea, he might yet be saved!" Her words were overheard by the crew of the fishing boat, who were securing its moorings. A momentary consultation took place, and with one consent they offered to carry her across, or perish. "It is madness," said the old man; "no boat can live in yonder broken sea." But the courage of the hardy fishermen was unshaken. The lady was placed on board; the skirt of the main-sail set, and after a passage as remarkable for its shortness as its danger, they reached the Scottish shores in safety. To the honour of these noble fellows be it recorded, that they refused to accept one shilling from the mourner, and followed her carriage with their eyes, invoking blessings on her journey.

The commiseration of all classes was painfully increased, by the length of time that elapsed between the trial and death of Major Campbell. In prison he received from his friends the most constant and delicate attention; and one lady, the wife of Captain ——, seldom left him. She read to him, prepared his meals, cheered his spirits when he drooped, and performed those gentle offices of kindness, which are so peculiarly the province of woman. When intelligence arrived that mercy could not be extended, and the law must take its course, she boldly planned an escape from prison, but Campbell recoiled from a proposition that would compromise his honour with the keeper. "What," he exclaimed, when assured that otherwise his case was hopeless, "shall I break faith with him who trusted in it? I know my fate, and am prepared to meet it manfully; but never shall I deceive the person who confided in my honour."

Two evenings before he suffered, Mrs —— urged him earnestly to escape. The clock struck twelve, and Campbell hinted that it was time she should retire. As usual, he accompanied her to the gate, and on entering the keeper's room, they found him fast asleep. Campbell placed his finger on his lip—"Poor fellow," he said in a whisper to his fair companion, "would it not be a pity to disturb him?" Then, taking the keys softly from the table, he unlocked the outer wicket. "Campbell," said the lady, "this is the crisis of your destiny—this is the moment of escape—horses are in readiness, and"——. The convict put his hand upon her mouth—"Hush!" he replied, as he gently forced her out, "would you have me to violate my promise?" Bidding her good night, he locked the wicket carefully, replaced the keys, and retired to his chamber, without awaking the sleeping jailor.

The last scene of his life was in perfect keeping with the calm and dignified courage he had evinced during his confinement. The night before his execution, the chaplain slept in his room. This gentleman's exertions to obtain a remission of punishment had been incessant, and now that hope was at an end, he laboured to prepare the doomed soldier for the trying hour that awaited him. On that melancholy night he never closed his eyes, while Campbell slept as quietly as if no extraordinary event should happen on the morrow. To the last, his courage was unshaken; and while his friends were dissolved in grief, he was manly and unmoved. He mounted the stone stairs leading to the scaffold with a firm and measured step; and while the rope was being adjusted, the colour never left his cheek, nor did his countenance betray the slightest agitation.

One circumstance disturbed his equanimity for a moment. On entering the press-room, the executioner, frightfully disguised, presented himself suddenly. Campbell involuntarily shrunk from this loathsome being, but as if annoyed that the wretch should shake his firmness for an instant, he calmly desired him to proceed, and take care that the arrangements for death were such as should make his transit from the world as brief as possible.

It was a curious incident attendant on this melancholy event, that the 42d regiment, with whom he had served in Egypt, then garrisoned the town; and the same men he led to a bayonet charge against the invincibles of Napoleon formed the jail guard to witness his execution. The feelings of the Highlanders when drawn out to be present at the ignominious end of their lion-hearted comrade, were indescribable. When the sufferer first appeared at the fatal door, a yell of anguish pealed along the ranks, and every bonnet was respectfully removed. Campbell addressed a few words to them in Gaelic. Instantly every face was upturned to heaven; every cheek was bathed in tears; every lip uttered a prayer for mercy at the judgment-seat; and when the board, descending with thundering violence, announced the moment of dissolution, the fearful groan that burst from the excited soldiery will never be forgotten.

After being suspended only till life was extinct, the body was placed in a shell, and a hearse in waiting received it, and drove off rapidly. The remains of the ill-starred soldier were conveyed to Scotland. There the clan and relatives of the deceased were waiting to pay the last tribute of their regard. In immense numbers they escorted the body to the family cemetery, and in the poet's words, "they laid him in his father's grave."—*Dublin University Magazine, October.*

POPULAR INFORMATION ON LITERATURE.

THE ITALIAN POETS.

Boccaccio.

At the sale of the Duke of Roxburghe's library, about twenty years ago, one book—a folio volume—was purchased by Earl Spencer at the enormous sum of *two thousand two hundred and sixty pounds!* This volume, which was perhaps the most famous one on earth, as it now appeared to be the dearest, was a copy of the first edition of Boccaccio's Dicamerone, printed at Venice by Christopher Valdarfer in 1474, and the only complete copy of that edition known to exist. It had been purchased by the duke's father, eighty years before, for a hundred pounds; but its rarity and value were now, it appeared, better known and more highly appreciated. If Boccaccio had no other interest than as the author of a volume which brought the price of a small estate, he would be worthy of some attention; but he has in reality a higher claim upon our notice, being one of the most ingenious and amusing writers whom the world ever produced.

He was the natural son of a Florentine merchant of considerable wealth, named Boccaccio di Chellino di Buonaiuto, by a lady of Paris, at which city the poet was born, in the year 1313. He was first designed by his father for a mercantile life; but having no taste for the counting-room, was afterwards sent to study the law, to which he soon manifested an equal dislike. From his earliest years he had shown an aptitude for learning, and he now set his father's anger at defiance, and devoted himself to a literary life. At Naples, to which he had been sent from Florence, to study law, he beheld some of the honours conferred on Petrarch, which inspired him with an ardent desire to gain similar distinction, but unfortunately without giving him any wish to imitate the pure and lofty conduct of that great man. Boccaccio became noted at once as a clever writer of poetry, and as the paramour of a married lady of Naples, a natural daughter of the king. All the earlier years of his life he spent in gaiety and vice at this dissolute capital, which is much to be regretted, as it gave a tinge to his best compositions, which has materially lessened their merit and usefulness.

Boccaccio has the distinction in poetry of having invented the stanza called the *ottava rima*, lately reintroduced into this country by Mr Tennant, and employed by Byron in his Don Juan. As a poet, however, he does not rank nearly so high as Dante and Petrarch. He wanted the sublimity and majesty of the one, and the lucid and tender delicacy of the other. He had neither that original and high-reaching imagination, nor those deep and moving sensibilities, which form the first-rate poet. It is as a novelist—as one of the fathers of that kind of composition—that Boccaccio is chiefly celebrated. His great work in this line is the Dicamerone, already mentioned, which contains one hundred tales or stories, and was given to the world in 1353. The book opens with a description of the plague which took place in 1348 at Florence—a picture full of horrors, and drawn with great power. He then relates how a party of ladies and gentlemen retired from the pestilence-stricken city to a country-house surrounded by pleasant grounds, where they shut themselves up for a time from all communication with the rest of the world. In this delicious retirement, which must have contracted new charms from the contrast with the scene they had left, and the feeling of comparative security which it inspired, they hit upon the expedient of story-telling as a means of passing the time: and each undertakes to relate all the tales or singular incidents which he or she can recollect. The entertainment continues for ten days (hence the title of the book), and on each day ten stories are told, which make up a hundred in all.

In all probability, the Dicamerone was a kind of concentration of all the popular stories then floating in Italian society; for it is not to be supposed that Boccaccio, inventive as his genius is allowed to have been, could form so many distinct *plots* in his own brain. He is entitled, however, to the merit of having thrown these traditionary anecdotes of human nature into a most attractive form, and of having produced, in the result, the best specimen of Tuscan prose hitherto known. "On the darkest and most terrific foreground," says Mr Stebbing, "which ever painter employed, he drew an infinite variety of the gayest and most graceful forms—of landscapes the most charming, and incidents the most amusing, that the human fancy could create." It is only to be regretted that this famous effort of the human intellect is deformed, in many places, by the grossest language and the most licentious thoughts, insomuch as to be totally unfit for the perusal of a large portion of society. The manners of the age are always presented as the excuse of the author for this great fault; but till it can be shown that his contemporary Petrarch found it necessary to make a similar concession to the spirit of the times, this apology must be held as utterly invalid. The truth is, Boccaccio sinned in this matter against his own better knowledge, in order to render his work acceptable to the dissolute class with whom he was familiar at Naples. He afterwards bitterly repented of his crime.

In the year 1350, when seven and thirty years of age, Boccaccio returned to Florence, where his father had just died, and began to take a leading part in public affairs. He soon after became personally acquainted with Petrarch, who was only nine years his senior, but possessed a mind and character infinitely more matured. Petrarch perceived his genius, and did his best, by good advices, to render him personally worthy of it. The result was an improvement in Boccaccio's course of life. When past middle life, he commenced the study of Greek, and founded schools for that branch of learning in various parts of Italy. It is generally acknowledged that the modern learned world owes the possession of many of the works of ancient Greece to this Italian novelist.

"Unfortunately for Boccaccio," says Mr Stebbing, "he was not wealthy, certainly not sufficiently so for the liberality which formed a striking feature of his character. The expenses in which he involved himself, sometimes in the exercise of his public functions, at others by his patronage of literature, were much greater than his income would bear. His fortune was thus gradually reduced, and he found himself, in the decline of life, with means scarcely sufficient for his support, and deserted by all his friends but Petrarch. The noble conduct of that affectionate and high-minded man in this instance, gives additional lustre to his fame. His letters to Boccaccio on the subject of his misfortunes, breathe the tenderest regard; and his offers of assistance are made in a spirit, of which it is difficult to say whether its warmth or delicacy be the more worthy of admiration. Besides offering him the use of both his purse and interest, he invited him to share his home; and in the letter, which is preserved, he reproves him for not accepting this invitation. 'I praise you,' says he, 'for having refused the grand offers made you of riches, and for preferring liberty of mind and a tranquil poverty; but I cannot give you the same praise for refusing the repeated invitations of a friend. I am not in a situation to enrich you; if I were, it should not be by my words, or by my pen, but by things and actions that you should judge of me. I am, however, living so, that what suffices for one will suffice abundantly for two, who can have the same inclinations as well as the same house.'

"Boccaccio, however, with the jealousy of a man whose most valued possession was his perfect personal liberty, refused to accept this offer, as he did also many others of his friend to obtain him some lucrative office. Petrarch could not be offended at this, for he had himself acted almost in the same manner, and rejected rank and fortune to move and speak as his own inclination might direct him. We cannot sufficiently admire this trait of character, so conspicuous in these great men, and which, from Dante downwards, was the characteristic of Italy's worthiest sons. There is no passage in their noblest works which so affects the mind with delight as their examples of independence. They were admired and courted by princes; they were the frequent residents of palaces; were tempted to become courtiers, not merely by offers of wealth or advancement, but by personal flatteries; and they might, if they had chosen, been conspicuous in the councils as well as courts of kings: but nothing could tempt them from their independence. We see them passing on from court to court, conversing with their princely hosts as if they had been prophets sent with lessons of wisdom, and then taking their farewell, unchanged in their manners, and with the same free look and spirit as they bore when they arrived."

In 1363, Boccaccio was invited to reside at Naples, but, not liking his reception, soon returned to Florence. He soon after retired to a cottage in the village of Certaldo, where he devoted himself for some years to Latin poetry, in which, however, he is not allowed to

have excelled. He was occasionally after this period entrusted by the Florentines with missions of high importance; and, finally, he returned to that city, and in 1373 commenced a public lecture on the Commedia of Dante, with a salary of fifty florins a-year. He did not live, however, to carry his exposition of that poem beyond the sixteenth book. The death of Petrarch, in 1374, afflicted him so deeply as to aid in hastening his own decline, which for some years had been rapidly proceeding. He died in December 1375, having only survived his friend about seventeen months.

THE BUCCANEERS.

Of that extraordinary daring class of pirates or sea-robbers, known by the name of *Buccaneers*, the following interesting account is given by Dr Russell, in his excellent work "The History of Modern Europe."

"After the failure of the mines of Hispaniola, and the conquest of the two extensive empires of Mexico and Peru, where the precious metals were found in the greatest profusion, that valuable island was entirely neglected by the Spaniards. The greater part of its once flourishing cities were deserted by their inhabitants, and the few planters that remained sunk into the most enervating indolence. The necessaries, however, and even many of the luxuries of life, were there found in abundance. All the European animals had multiplied exceedingly, but especially the horned cattle, which were become in a manner wild, and wandered about in large droves, without any regular owner. Allured by these conveniences, certain French and English adventurers, afterwards known by the name of Buccaneers or Freebooters, had taken possession of the small island of Tortuga, as early as the year 1632, and found little difficulty, under such favourable circumstances, of establishing themselves on the northern coast of Hispaniola. They at first subsisted chiefly by the hunting of wild cattle. Part of the beef they ate fresh, part they dried, and the hides they sold to the masters of such vessels as came upon the coast, and who furnished them, in return, with clothes, liquors, fire-arms, powder and shot. The dress of the Buccaneers consisted of a shirt dipped in the blood of the animals they had slain; a pair of trousers, dirtier than the shirt; a leathern girdle, from which hung a short sabre, and some Dutch knives; a hat without any rim, except a flap before, in order to enable them to pull it off; shoes made of raw hides, but no stockings. These barbarous men, the outcasts of civil society, were denominated *Buccaneers*, because they dried with smoke, conformable to the custom of the savages, part of the flesh of the cattle they had killed, in places denominted *buccans* in the language of the natives. But the wild cattle at length becoming scarce, the Buccaneers were under the necessity of turning their industry to other objects. The sober-minded men applied themselves to the cultivation of the ground, which abundantly requited their toil, while those of a bold and restless disposition associated themselves with pirates and outlaws of all nations, and formed the most terrible band of ravagers that ever infested the ocean. To these ravagers, however, rendered famous by their courage and their crimes, France and England are indebted, in some measure, for the prosperity of their settlements in the West Indies.

Nothing could appear less formidable than the first armaments of the piratical Buccaneers. Having formed themselves, like the hunters of wild cattle, into small societies, they made their excursions in an open boat, which generally contained between twenty and thirty men, exposed to all the intemperature of the climate; to the burning heat of the day, and the chilling damps of the night. The natural inconveniences, connected with this mode of life, were augmented by those arising from their licentious disposition.

A love of freedom, which, duly regulated, cannot be too much cherished, rendered the Buccaneers averse to all those restraints which civilized men usually impose on each other for their common happiness; and as the authority which they had conferred on their captain was chiefly confined to giving orders in battle, they lived in the greatest disorder. Like savages, having no apprehension of want, nor taking any care to guard against famine by prudent economy, they were frequently exposed to all the extremities of hunger and thirst. But deriving, even from their distresses, a courage superior to every danger, the sight of a sail transported them to a degree of frenzy. They seldom deliberated on the mode of attack, but their custom was to board the ships as soon as possible. The smallness of their own vessels, and their dexterity in managing them, preserved them from the fire of the enemy. They presented only to the broadside of a ship, their slender prows, filled with expert marksmen, who fired at the enemy's port-holes with such exactness, as to confound the most experienced gunners; and when they could fix their grappling tackle, the largest trading vessels were generally obliged to strike.

Although the Buccaneers, when under the pressure of necessity, attacked the ships of every nation, those belonging to the subjects of Spain were more especially marked out as the objects of their piracy. They thought that the cruelties which the Spaniards had exercised on the natives of the New World, were a sufficient apology for any violence that could be committed against them. Accommodating their conscience to this belief, which, perhaps, unknown to themselves, was rather dictated by the richness of the Spanish vessels than by any real sense of religion or equity, they never embarked in an expedition without publicly praying to heaven for its success; nor did they ever return loaded with booty, without solemnly returning thanks to God for their good fortune.

This booty was originally carried to the island of Tortuga, the common rendezvous of the Buccaneers, and then their only place of safety. But afterwards the French went to some of the ports of Hispaniola, where they had established themselves in defiance of the Spaniards, and the English to those of Jamaica, where they could dispose of their prizes to more advantage, and lay out their money more agreeably, either in business or pleasure.

Before the distribution of the spoil, each adventurer held up his hand, and protested he had secreted nothing of what he had taken; and if any one was convicted of perjury, a case that seldom occurred, he was punished in a manner truly exemplary, and worthy the imitation of better men. He was expelled the community, and left, as soon as an opportunity offered, upon some desert island, as a wretch unworthy to live in society, even with the destroyers of their species!

After providing for the sick, the wounded, the maimed, and settling their several shares, the Buccaneers indulged themselves in all kinds of licentiousness. Their debauches, which they carried to the greatest excess, were limited only by the want that such prodigality occasioned.

The ships that sailed from Europe to America seldom tempted the avidity of the first Buccaneers, as the merchandise they carried could not readily have been sold in the West Indies in those early times. But they eagerly watched the Spanish vessels on their return to Europe, when certain they were partly laden with treasure. They commonly followed the galleons and flota employed in transporting the produce of the mines of Mexico and Peru, as far as the channel of Bahama; and if, by any accident, a ship was separated from the fleet, they instantly beset her, and she seldom escaped them. They even ventured to attack several ships at once; and the Spaniards, who considered them as demons, and trembled at their approach, commonly surrendered, if they came to close quarters.

The Spaniards, almost reduced to despair by finding themselves a continual prey to those ravagers, diminished the number of their ships, and the colonies gave up their connections with each other. These humiliating precautions, however, served but to increase the boldness of the Buccaneers. They had hitherto invaded the Spanish settlements only to procure provisions; but no sooner did they find their captures decrease, than they determined to procure by land that wealth which the sea denied them. They accordingly formed themselves into larger bodies, and plundered many of the richest and strongest towns in the New World. Maracaybo, Campeachy, Vera Cruz, Porto Bello, and Carthagena, on this side of the continent, severely felt the effects of their fury; and Guiaquil, Panama, and many other places on the coasts of the South Sea, were not more fortunate in their resistance, or treated with greater lenity. In a word, the Buccaneers subjected to their arms, without a regular system of government, without laws, without any permanent subordination, and even without revenue, cities and castles which have baffled the utmost efforts of national force; and if conquest, not plunder, had been their object, they might have made themselves masters of all Spanish America.

Among the Buccaneers who first acquired distinction in this new mode of plundering, was Montbars, a gentleman of Languedoc. Having by chance, in his infancy, met with a circumstantial, and perhaps exaggerated account of the cruelties practised by the Spaniards in the conquest of the New World, he conceived a strong antipathy against a nation that had committed so many enormities. His heated imagination, which he loved to indulge, continually represented to him innumerable multitudes of innocent people, murdered by a brood of savage monsters nursed in the mountains of Castile. The unhappy victims, whose names were ever present to his memory, seemed to call upon him for vengeance; he longed to embrue his hands in Spanish blood, and to retaliate the cruelties of the Spaniards, on the same shores where they had been perpetrated. He accordingly embarked on board a French ship bound to the West Indies, about the middle of the seventeenth century, and joined the Buccaneers, whose natural ferocity he inflamed. Humanity in him became the source of the most unfeeling barbarity. The Spaniards suffered so much from his fury, that he acquired the name of the *Exterminator*.

But of all the Buccaneers, French or English, none was so uniformly successful, or executed so many great and daring enterprises, as Henry Morgan, a native of Wales. While de Basco, Lolonois, and their companions, were squandering at Tortuga the spoils they had acquired in the Gulf of Venezuela, Morgan sailed from Jamaica to attack Porto Bello; and his measures were so well concerted, that soon after his landing, he surprised the sentinels, and made himself master of the town, before the Spaniards could put themselves in a posture of defence.

In hopes of reducing with the same facility the citadel or chief castle into which the citizens had conveyed their most valuable property, and all the plate belonging to the churches, Morgan bethought himself of an expedient that discovers his knowledge of national characters as well as of human nature in general. He compelled the priests, nuns, and other women, whom he had made prisoners, to plant the scaling ladders against the walls of the fortress, from a persuasion that the gallantry and superstition of the Spaniards would not suffer them to fire on the objects of their love and veneration. But he found himself deceived in this flattering conjecture. The Spanish governor, who was a resolute soldier, used his utmost efforts to destroy every one that approached the works. Morgan and his English associates, however, carried the place by storm, in spite of all opposition, and found in it, beside a vast quantity of rich merchandise, bullion and specie equivalent to one hundred thousand pounds sterling.

With this booty Morgan and his crew returned to Jamaica. He subsequently engaged in the most daring enterprises, in which, by his extraordinary intrepidity, he was successful to an astonishing degree. Finally, he carried all his wealth to Jamaica, and never afterwards engaged in any piratical enterprise.

The defection of Morgan, and several other principal leaders, who sought and found an asylum in the bosom of that civil society whose laws they had so atrociously violated, together with the total separation of the English and French Buccaneers, in consequence of the war between the two nations, which followed the Revolution in 1688, broke the force of those powerful plunderers. The king of Spain being then in alliance with England, she repressed the piracies of her subjects in the West Indies. The French Buccaneers continued their depredations, and with no small success, till the peace of Ryswick in 1697; when all differences between France and Spain having been adjusted, a stop was every where put to hostilities, and not only the association, but the very name of this extraordinary set of men, soon became extinct. They were insensibly lost among the other European inhabitants of the West Indies."

RAMBLE IN SOUTHERN AFRICA.

While residing in the vicinity of Simon's Town, South Africa, I felt exceedingly anxious to see some part of the interior of the country, which I made known to a friend, who hesitated not a moment to accompany me to a part where he considered we might have some good sport. The day was appointed; every thing arranged; good horses fitted for a long journey; with plenty of provisions in the sacks, in the event of scarcity on the road, and a good store of brandy-wine. We set off, sauntering for about sixteen miles, when we stopped at a place called Myrtles, where we partook of the usual hospitality of the proprietor, previous to commencing our cruise over the sandy desert. After having regaled ourselves with his good wine, I set off at quick speed, my friend keeping up the chase for a considerable time, when our attention was hastily attracted by a variety of scattered sweet-scented flowers and variegated heaths, growing from the sandy soil, and emitting a most fragrant odour. By this time the sun had risen considerably above the horizon, which imparted to myriads of insects an increased vigour; for they now attacked us with such determined hostility, that every possible means of self-defence left us became of little or no avail. We rolled up our heads, hands, and necks, but still their mode of attack was so insidious, that it defied all our skill to oppose them. The horses were now getting knee-deep in sand, which, with the annoyance of insects, tended not a little to protract our advancement.

After you leave the main road leading to Cape Town, there is a flat of fifteen or twenty miles, where there is little or no vegetation, principally sand; here and there a solitary hut, inhabited by the wandering Hottentots; a dog invariably proclaims the approach of a stranger, when a black face or two are immediately seen to peep from the door of the hovel. Several of these we went up to, to procure some intelligence of our road: we always found them civil, and ever ready to satisfy our inquiries. The sands, as we approached Stillmbock, appeared considerably elevated, assuming various figures, surrounded generally with small pools of water at their base, which gave us at times very considerable uneasiness. Our horses stood apparently timid, and would not advance, when, in such circumstances, we were compelled to retrace our steps. The horses evidently knew of the danger much better than we did. After several hours' hard pushing through the sands, we at last got firm footing at the base of a chain of mountains in the vicinity of Stillmbock, where we were cheered not a little by the sight of a boor's house, where, generally speaking, is found a hearty welcome, and every thing necessary to satisfy the cravings of nature. We inquired how far we were to Stillmbock, when we were told an hour and a half's distance, which we mistook for a mile and a half. We rode cautiously on, expecting every now and then to come in sight of the town; but of no avail. We then found, on a second inquiry, that it was nine miles off in place of a mile and a half; they allow six miles for the hour on horseback, and four on foot. We arrived at Stillmbock in the afternoon (after a ride of forty-two miles) perfectly exhausted—in such a state that we could neither sleep, lie, walk, nor sit; but I attribute this inexpressible restlessness to constant

drinking to quench our thirst, more than any other circumstance. A person travelling in a hot climate will satisfy his thirst with a little hot water, sooner than with any thing else, and it is void of danger. After a few minutes' sleep, we arose to survey the town, which I believe to be one of the neatest in Southern Africa. Here the doors and windows of the houses are generally shut all the fore part of the day, and scarcely a being is to be seen on the streets till the afternoon, when all are open, and every one alive. There is a good deal of taste displayed in the arrangement of the houses: the streets are parallel, and at right angles; at each side of the streets are rows of trees, and at their roots runs a small rivulet. The name of our boarding-house was Sartein's, a Dutchman; every thing was exceedingly clean and comfortable, and very moderate in price. Next morning we set off about five o'clock, both horses and riders being apparently considerably refreshed from their previous fatigue. After steering for some time a northerly course, we kept a little more to the westward, for the mountains of French Hook, a distance of twenty miles from our last port. The country now began to assume a very different aspect: in place of the barren dry sandy desert, we now had a perfect garden; from the lowest part of the valley, to the summit of the highest mountain, appeared one scene of rich foliage; this was in the neighbourhood of Drachenstein. As we advanced several miles farther up, we became perfectly encircled with mountains, towering to the heavens, assuming various aspects, some rising in the form of cones, others more irregular and flat. The scenery six miles above Drachenstein is remarkably picturesque and beautiful; here you command a most extensive view of the adjacent country.

The soil is exceedingly rich, bearing fruit of every description, here and there studded with patches of fine stately trees, affording shelter to the natives from the rays of the sun. We arrived at French Hook in the fore part of the day, and put up at the house of Mynheer Hugo, who is a descendant of the Huguenots who emigrated from France in the time of the revolution, from religious motives. When we approached his door, although we had never seen this man in our lives before, he came immediately and shook us by the hand; and we were thereafter introduced to his wife. We kept within doors the most of the day, and walked about only in the evening. The scenery here is really splendid: the whole valley is surrounded with stupendous mountains, and covered with an immense variety of bulbous and other flowers, and an almost endless succession of heaths.

The people are exceedingly hospitable and kind: they cannot be said to speak Dutch; it is a mixture of Dutch, English, French, and Portuguese. Next morning, we found there had been rain during the night, and that several wild animals had been prowling about. They had lost two of their geese in consequence of jackals. The footmarks of several wolves were seen in the immediate vicinity, when a party of four of us determined beating up their den. We started early in the morning, well mounted and armed, following their footmarks down the river leading to Drachenstein. After crossing the river several miles down, we started a large buck, with splendid black horns, larger than any of our deer; every one put his horse to its speed, to come up with it for a shot. I unfortunately had the best horse for racing; consequently led the course, and outdistanced them; but, intending to make a nearer cut, made for a jungle, when I and my horse instantly disappeared: my horse sunk to the neck, and I lay sprawling in the mire over his head, stupified, and wondering what had happened: the horse appeared considerably exhausted: I allowed him to regain his wind, when he made one or two strong efforts to extricate himself to no purpose; but, upon another trial, he fairly overcame the difficulty, when I remounted, and followed my leaders cautiously for another shot at the buck; but when within two or three hundred yards, I heard a shot fired by one of the party, which missed him, and consequently he was lost. We now bent our course to a large clump of trees, a considerable way down the river; here we dismounted, and led our horses along a steep and dangerous pathway for a considerable distance, till we got on the flats, when every one put his horse to rights, and set off, following the course of the stream. We arrived at a small hut, called the Wolf's Trap; here we dismounted, unsaddled our horses, tied their heads to their feet (a common practice in this country), and examined the hut, which we found to be a good-sized square house, built of stone, with a small aperture in the top, and a good large doorway. The door is heavy, and made of wood and iron, kept up by a cord and pulleys. At this place we left our horses, to ascend the mountain to a place covered with trees and brushwood; two were appointed to go to the den of the wolves (myself and another), and to sit at a distance from the brushwood, about a yard from their footmarks. My friend and I sat for nearly an hour on each side of the footmarks, with our guns charged and cocked; but there being no appearance of either our friends or the wolves, we determined on going in pursuit of them. When I approached the den, I heard a dreadful noise and bustle among the bushes; and perceiving several animals making their way towards me, I fancied imminent danger; so I fired, but, when the smoke disappeared, I found I had killed a large baboon, of which description of animals there are here immense numbers. Being now thoroughly fatigued with this luckless adventure, the party retraced their way to Drachenstein, determined to renew the expedition in quest of the wolves on the rising of the morrow's sun.

WEDDED LOVE.

Say not, that pure and wedded love expires—
Pure wedded love, in gentle bosoms stored;
Say not, oh, say not, that its fond desires,
Like water-drops on thirsty sand outpour'd,
Can perish wholly, or, by slow decay,
Like smouldering flames, die sullenly away!
Is love so fickle that it *cannot* rest
To one dear home confined—one chosen nest—
Though daily use weave chains of mild constraint
And fond affection pour her moving plaint
To win the truant back?—A thousand ties,
A thousand spells, each passing day supplies;
And all we see without, or feel within—
Resolves, and hopes, and fears—love's being feed,
Preserving, even in this world of sin,
Its sacred flame unchanged—the common *need*,
Of friendship's tender soothing, from above
Infused; the fountains of parental love
Solicitous, that know not pause or rest,
Flowing with ceaseless tide in either breast.
The sigh, the tear,
For long-lost friends who once to both were dear;
Fond recollections glean'd from other days,
The look, the voice that only spoke to praise—
Remember'd joys, remember'd hopes and fears,
With many a scene upon life's busy stage,
Or acted, or beheld, in other years,
And many a blotted and repentant page
Of faults by youthful folly ill excused,
Not seldom, nor with tearless eye, perused
In wisdom's later hour. Grave thoughts and gay
Commix'd, by which, in life's declining day,
Our hearts, tenacious of the past, are stirr'd,
As by the music of far-distant bells,
Over the surface of deep waters hear
That roll their space between.—
Such holy spells
Has pure and wedded love; degenerate minds,
Minds bent to earth, foredoom'd of old to know,
Nor lofty thoughts, nor the perpetual glow
Of high affection, that collects and binds
And treasures up what the dull sons of earth
See not, or, seeing, little deem their worth—
The scattered jewels of life's *beaten* track—
Such minds misdeem of love: they cannot sound
Its silent waters, from their own depth black;
They know not, reck not of its base and ground;
No feelings do their bosoms know, that plead
For liberty, and clamour to be freed—
But as, on autumn days, who loves to walk
In the fresh morning, an unwonted sight
Beholds;—dew-sprinkled threads from stalk to stalk
Suspended, glistening with refracted light;
And the cool earth, with pearly frost-work spread,
A new creation seems, for human tread
Unmeet—so, even so, the tender heart,
In the clear realms of elevated thought,
Sitting in simple dignity apart,
Beholds a scene of varied beauty wrought
From daily products of our common life;
Beholds the seeds and elements of strife
Transform'd and blended, by the subtle power
Of mighty love, with light celestial glow—
Even till moral beauty seems the dower
Of this our earthly state, this world of sin and woe!

—*Friendship's Offering*, 1828.

UTILITY OF A TRADE.

Postlethwayte, in the Introduction to his Dictionary of Trade and Commerce, relates the following very curious anecdote, which he says was told by George the First of Great Britain, as having come under his own knowledge:—"About the year 1615, there was a nobleman in Germany, whose daughter was courted by another young lord. When he had made such progress in this affair as is usual, by the interposition of friends, the old lord had a conference with him, asking him how he intended, if he married his daughter, to maintain her. He replied, equal to her quality. To which the father replied, that was no answer to his question; he desired to know what he had to maintain her with. To which the young lord then answered, he hoped that was no question; for his inheritance was as public as his name. The old lord owned his possessions to be great; but still asked if he had nothing more secure than land wherewith to maintain his daughter. The question was strange, but ended in this, that the father of the young lady gave his positive resolve never to marry his daughter, though his heir, and would have two great estates, but to a man that had a manual trade, by which he might subsist if drove from his country. The young lord was master of none at present; but, rather than lose his mistress, he requested only a year's time, in which he promised to acquire one: in order to which, he got a basket-maker, the most ingenious he could meet with, and, in six months, became master of his trade of basket-making, with far greater improvements than even his teacher himself; and as a proof of his ingenuity and extraordinary proficiency in so short a time, he brought to his young lady a piece of workmanship of his own performance, being a white twig basket, which for many years after became a general fashion among the ladies by the name of *dressing-baskets*, brought hither to England from Germany and Holland.

"To complete the singularity of this relation, it happened, some years after this nobleman's marriage, that he and his father-in-law, sharing in the misfortunes of the wars of the Palatinate, were driven naked out of their estates; and in Holland, for some years, did this young lord maintain both his father-in-law and his own family, by making baskets of white twigs, to such an unparalleled excellency as none could attain; and it is from this young German lord the Hollanders derive those curiosities which are still made in the United Provinces, of twig-work."

EXERCISE.

I may (says Dr Uwins, in his recent Treatise on Mental Diseases) urge upon all, and especially those whose habits and callings are sedentary, to contrive some motive for daily and regular walking; even should they not appear at present inconvenienced by their confinement, the cloud will be insensibly collecting that shall sooner or later darken their spirits, or break upon them in the fullness of apoplectic stertor. A physician with whom I was well acquainted, and who scarcely ever was upon his legs, used to say to me, that he found no inconvenience in sitting, day after day, in his carriage and his study; nor did he, so far as his immediate feelings were concerned; but he died suddenly and prematurely from an apoplectic stroke, which I verily believe might have been averted had he made less use of his carriage and his books, and more of his limbs. In contrast with his case, I will just state that I last week conversed with a veteran in literature and in years, whose powers of mind no one can question, however they may differ from him in speculative points. This gentleman has preserved the health of his body and the "soundness" of his mind through a long course of multifarious and often distressing circumstances, by steady perseverance in the practice of walking every day. It is curious that he has survived, for a very long period, almost all the literary characters that were his friends and contemporaries at the period in which his own writings excited so much public attention; almost all of those who have dropped into the grave one after the other, while he has continued on in an uninterrupted course, were men of far less regular habits, and, I am obliged to add, also of much less equanimity of mind; but the preservation of this equanimity has, I verily believe, been mainly insured by the unvaried practice to which I have referred, and which to others would prove equally available, if steadily and perseveringly pursued. "Were I a gentleman, Dr Uwins," my neighbour, Mr Abernethy, used to say to me, "I would never get into my carriage;" and certain it is, that many diseases of the most troublesome kind, besides unsoundness of mind, may be traced to the idle habit of carriage gestation.

DEBATING IN NEW ORLEANS.

The Creoles speak French, and the Americans English, neither understanding the language of the other. Whenever a speech is concluded, an interpreter gives as perfect a version of it as his memory can command. The time thus lost is enormous under any circumstances; but when the debate becomes personal, it has at least the advantage of giving members time to cool. On one occasion, however, the discussion was conducted with a good deal of acrimony, and the scene became ludicrous enough. A French gentleman, when I entered the house, was delivering an energetic oration, impugning both the conduct and motives of an American. The latter during the whole time remained apparently in happy ignorance, both of the nature and extent of the punishment of which he was the object. At length the honourable gentleman sat down, and the chief heads of his speech and arguments were detailed in English by the interpreter. The American then became, as they say in Scotland, "neither to hold nor to bind." He instantly commenced not only a vehement defence of himself, but an attack on his opponent, in a language of which the latter seemed to understand precisely as much as he did of Sanscrit.—*Men and Manners in America.*

WASTE OF CORN IN AGRICULTURE.

It is estimated, that only one-third of the seed-corn sown on the best land, grows; the other two-thirds are destroyed. The number of cultivated acres, in Great Britain and Ireland, amounts to 47,000,000; 30,000,000 of which are under the plough. Two-fifths of the latter, or 12,000,000 acres, are annually under the cereal crops. The average allowance of seed for the three kinds of corn, may be stated at 4⅔ bushels per acre. The quantity of seed annually sown thus amounts to 7,000,000 quarters. If two-thirds of this quantity are rendered unproductive by some agency which has hitherto been uncontrolled, then 4,666,666 quarters of corn are annually wasted! The quantity thus lamentably wasted would support more than 1,000,000 of human beings.—*Quarterly Journal of Agriculture.*

London: Published, with Permission of the Proprietors, by Orr & Smith, Paternoster Row; G. Berger, Holywell Street, Strand; Bancks & Co., Manchester; Wrightson & Webb, Birmingham; Willmer & Smith, Liverpool; W. E. Somerscale, Leeds; C. N. Wright, Nottingham; Westley & Co. Bristol; S. Simms, Bath; J. Johnson, Cambridge; W. Gain, Exeter; J. Purdon, Hull; G. Ridge, Sheffield; H. Bellerby, York; J. Taylor, Brighton; and sold by all Booksellers, Newsmen, &c. in town and country.—Chambers's Historical Newspaper, a Supplement to the present publication, is published on the first of every month; and Chambers's Information for the People, of which every number is a distinct subject of human knowledge, and which will be completed in one volume, appears once every fortnight.

THE MAN WHO SUNG WHEN ASKED.

EVERY body has had occasion to feel annoyed at the answers usually given in company to a request for a song. It seems to have been a pristine feature of human nature, that no man could sing when he was asked—for Horace indignantly remarked the fact eighteen hundred years ago. The party either never sings, or, if known to have done so at any former period, he is sure to be so ill with a cold, that he can upon no account exhibit on the present occasion. In the words of Madame Corri, he has "a leetle kittlin in de breast, and a leetle horse at de trot." He must really be excused to-night, &c.; and then he gets up a cough with more or less success, by way of a practical affidavit of the truth of what he alleges. So unavoidable, apparently, is this wretched affectation, that we have known a person who, being both able and willing to sing, privately hinted to some one to ask him, and who yet, when the request was made, set forth all the usual apologies, as if he had been startled at the very idea of a vocal exhibition.

It has always been held as a particular claim upon the praise of history, that any individual should, in the prevalence of a monstrous vice, hold forth an example of the opposite virtue. Why do we so much extol Aristides?—because he was just in the midst of a people who were the reverse. Why do we reverence the name of Archbishop Leighton?—because he was moderate when all his brethren were furious. On this principle, how much must we admire any man who, instead of annoying his fellow-creatures when asked to sing, by allegations that he cannot, was positively anxious to be asked, and no sooner heard the request than, with one preliminary hem, if so much, he was off full bound into a canticle! Such a man, reader, *has* lived—*when*, we cannot tell; but certainly—

Once in the flight of ages past,
There lived a man—

who sung when he was asked; of this we can assure you. His name was Smith, and he resided, while as yet vouchsafed for the adornment of human nature, in the city of York. It cannot be very long since Smith lived; for traditions of him are still fresh in the memory of a grateful people about that part of the country. He is said to have been a smart, neat, little man, somewhat vain about his person, and also about his singing, but redeeming every fault by that one lustrous virtue, in which he shone pre-eminent above his kind, a willingness to sing when he was asked. Alas, that such a man should have been mortal, or that, in dying, he should have left no copy!

Smith's habits were those of a convivial old bachelor; for though he had been married in early life, he had been so long a widower, that the feelings and tastes of single life had all returned upon him. Being quite at ease in his circumstances, he thought of nothing but how he might best enjoy life—how he might, with the greatest ease, attend the greatest possible number of social meetings, drink the greatest possible quantity of punch, and sing the greatest possible number of songs. He belonged to a vast number of clubs and musical associations, not only in York, but throughout all the neighbouring country; and he would often travel fifty miles, in order to contribute to the attraction of a glee festival. Being such a sure card for a song, he was invited, moreover, to a vast number of private parties, insomuch that, one way and another, he scarcely ever missed punch and music a single night. To such festive assemblages, Smith never went till pretty near supper-time. If, when he went, he found any thing like a dance going on, he was very apt to turn at the drawing-room door, and go away perhaps to some club, where he would spend an hour in singing, and then return in time for supper. If he did go in, and endeavour to stay out the dancing, it was always evident, from his fidgetty aspect, how earnestly he longed to see all this folly over, and the people descending to the dining-room. Smith really liked supper. If he once saw a party fobbed off with sandwiches up stairs, he marked the house with a black cross in his remembrance, and would never go back again. At table, he always contrived to get himself planted as near the middle as was consistent with the likelihood of his escaping the business of carving. The lady might be anxious to honour him with a seat next herself; but this he always modestly evaded. Having got himself planted in his favourite place, he would look kindly about to the rest, who were still perhaps hesitating where to alight, and say, "Pray, gentlemen, take your seats; plenty of room." To the actual business of supper, he always addressed himself with great earnestness. When he ate, like the Irishman sleeping, he "paid attention to it." Carving he detested. He thought it took up too much time, and was apt to cause his meat to cool. As to the quarter of an hour said to be allowed to carvers, "Sir," said he, "it is all a deception. Though you were to carve all the time till the rest were done, they would still stare if they saw you eating after them. And how, sir, can any man continue to ply his knife and fork, while other twenty people, perhaps, are waiting for something else, and wondering how you can possibly eat what they have already satisfied themselves of. No, sir; the result of these disinterested services in behalf of mankind, is, simply, that you are compelled to huddle all your operations into a half or a third of the time allowed to the company at large, and, in short, that you make a bad supper. Sir, all these duties ought to be performed by servants." Not long after the conclusion of supper, and while nobody was thinking of such a thing, Smith's voice would be heard suddenly piercing the hum of conversation, his only commission for such an intrusion consisting in an unheard sentence, which he *saw* addressed to him by the lady of the house, and which, though it perhaps referred to something quite different, he was pleased to consider as a request for a song. A nod was as good as a wink to Smith in asking for a taste of his vocal powers.

Our friend was what is called a good, but not a brilliant or perfect singer. He had a stout gentlemanly voice, calculated to be of great service as a bass in a trio or duett, but not by any means a fine voice. Nevertheless, he sung with so much spirit and appropriate expression, that, in general, his performances were much admired, not to speak of the additional approbation which he always secured by his being so willing to contribute to the amusement of the company. Smith had just one fault, so far as singing was concerned. When once he was set a-going, there was no getting him to stop. When one of his songs was done, it would perhaps become the subject of conversation. "Capital song that—first-rate old fellow, Dibdin." "Yes, sir: but did you ever hear his Tom Bowling?—that is better still." And then, without further preface, he would commence—

"Here a sheer hulk—"

and so forth; after which, another could be tagged as slightly on to that, and another to that again, till you could almost echo his words, and wish that "death had brought him to." Smith estimated the pleasantness of a party, and the hospitality of the landlord and landlady, and the worldly worth and amiability of the whole company, by the number of songs he was asked or permitted to sing. "A deuced nice affair we had last night at Atherton's. I sung two-and-twenty of my very best. Thought I would have got in the twenty-third; but an old jade in a pink cap broke us up between twelve and one, just as I was about to begin." It was told of Smith, that he once stuck a song for want of the words (a most astonishing occurrence), and was so overwhelmed with shame on the occasion, as to leave the room abruptly, and rush away home. He had walked more than a mile on his way, when he suddenly recollected the missing stanza. Back he turned, crying, "I have it, I have it." On re-entering the room, he found the company just on their feet to depart. "Stop, stop," he cried, in the tone of a man arresting an execution with a reprieve; "stop, here it is!" And, though almost breathless, he immediately resumed the song at the exact point where he had left off, with all the proper gesticulation, expression, and so forth, as if no hiatus had taken place.

Indeed, it must be allowed, great as his merit was, that singing had at length become a kind of hobby with him. He had rushed from the extreme of reluctance to the extreme of facility, and, by the praises of those who are not above flattering the foibles of an old man, had become dreadfully puffed up about his musical talents. He took it positively ill, if he were not permitted to sing at least a dozen times in an evening; and he has been known to retire at about the ninth or tenth, muttering, "confoundedly shabby." Then his whole business during the day was to go about, calling upon the persons who had heard him sing the night before, in order to gather their applauses. "I think I was in good voice last night, eh?"—thus delicately he would bring on the subject. And no sooner had he got out of any one person all the praise he thought it likely that he *could* get, than off he whisked to another, whom he put through exactly the same process. It is on record that he was once standing in the street, in conversation with a group of friends, when he suddenly espied a person who had heard him sing on the preceding night, riding past in a stage-coach, which had just started for Durham. "Bless me!" he exclaimed, "there is Hanway just off—not to be back for a week. Ho, coachman, ho—hilloa—hillahoa!" And off he ran in pursuit, as if he had been an intending but belated passenger. A porter soon took up the case, and ere long the coach was arrested, though not till it had advanced about a fifth of a mile along the street. Once he saw it stop, he felt safe, and, as all philosophical travellers do, took his own time to overtake it. On getting up, he opened the door, and, popping in his head, "Eh, Hanway," cried he, "glad to see you before you go. Pleasant party last night. I was in excellent voice—wasn't I?" "Charming," answered his friend; "but aren't you going with us?" "How did you like the Heaving of the Lead?" said Smith, blinking the subject of a journey. "Excellent," responded Hanway. Here the coachman, finding he was not to get a customer, called to him with a somewhat uncivil execration, to shut the coach door. Hearing the whip cracking, Smith saw there was no time to be lost; so he just mentioned Black-eyed Susan, and, shutting the door, gazed wistfully at the open window, in the almost desperate hope of an answer. To his inconceivable gratification, the face of Hanway appeared there for an instant, as the coach was wheeling off: and something like "Beats Incledon" was just caught up from the rattle of the departing wheels, by the eager vocalist, who then turned slowly back, his soul set completely at rest on the subject.

Smith no doubt had his faults—and who wants them? His failings, however, leaned to virtue's side;

His eagerness to shine, and avidity of praise, formed the very sources of that transcendant characteristic merit—his readiness to sing when asked. Strangers, it was observed, were always delighted with Smith. They were powerfully struck at meeting a man who required no pressing to sing. He seemed to them a kind of divinity—something above nature. If his merits were less readily acknowledged by those who were frequently in his company, it was solely owing to the novelty having been in their case a little worn off, and to the long-established fact, that a man is nowhere so little a prophet as in his own country. Smith now lies in York Cathedral, where he so often joined his voice to the swelling choir. But no monument records his name, or the period when he lived. He is just remembered (and what need is there of more?) as "THE MAN WHO ALWAYS SUNG WHEN HE WAS BID!"

POPULAR INFORMATION ON LITERATURE.

THE ITALIAN POETS.

THE reader has seen that, in the space between the years 1300 and 1400, Dante wrote a large allegorical poem referring to the mysteries of religion, Petrarch a long series of love-sonnets, and Boccaccio several poems of a lighter cast than either, besides a cluster of small novels, considered even yet as among the most amusing of all existing books. These great feats of the intellect were performed long before the invention of printing, when an author could only give his writings to the world by permitting a few copies to be taken from his own manuscript, or by having them recited in the presence of the great. It is surprising, notwithstanding the awkwardness and difficulty of this mode of publication, that the verses of all the three poets we have alluded to, were, even in their own lifetimes, as familiar to the common people as we have seen the music of Weber and Auber in our own day. So much was this the case, that Petrarch, in the pride of learning, regretted having written any thing in the vulgar tongue, to be thus bandied about from one peasant's mouth to another, and appreciated none of his works but those in Latin, which are now entirely neglected. It is thus apparent that, at a time when *we* were a very rude people, the Italians possessed a taste for the most refined productions of genius. But, indeed, we cannot even yet, engrossed as we are in commercial cares, form any adequate idea of the sensibility of this southern people, to whom taste is a kind of staple and common inheritance, and whose every thought seems tuned to music.

About a century after Petrarch and Boccaccio had passed away, a new style of poetry sprung up in Italy—the romantic style, it has been called—consisting in the composition of long versified romances on the adventures of some imaginary hero of chivalry, mingled with a great deal of supernatural agency. The first great work of this kind was the "Orlando Innamorato" (Orlando in Love) of Boiardo, who was a gentleman of large property in the state of Ferrara, in the north-east quarter of Italy, born about the year 1434. A curious anecdote is related of this poet. He was at a loss, it seems, for a fine-sounding name to his chief character, when suddenly in hunting, the word Rodomonte started into his mind, and seemed to him all that could be desired. He instantly turned his horse's head and rode home to his mansion of Scandiano, where he ordered all the bells to be set a-ringing in honour of Rodomonte, filling his vassals, it is said, with astonishment, as they had never before heard of such a saint! Boiardo was a courtier and a diplomatist, but generally spent his time between his country mansion and the court of Ferrara. It is said that whenever he had finished a canto of his romance, he took it with him to Ferrara, and there, in the presence of a brilliant court, of which every member, from the prince to the youngest page, was prepared to applaud him, recited his gay and charming inventions.

ARIOSTO.

Ludovico Ariosto, who completed the poem of Boiardo by adding the "Orlando Furioso" (Orlando in Phrenzy), was born at Reggio in 1474, the eldest son of the governor of that city, a gentleman of good family but small wealth. Ariosto was bred to the law, but, like Petrarch and Boccaccio, deserted it for poetry. He was compelled, however, at an early period of life, to exert himself for the support of a large family left as a burden upon him by his father; a duty which he is said to have performed in a most creditable manner. At the age of twenty-nine, he had distinguished himself so much by his verses, as to be taken under the protection of Cardinal Ippolito of Ferrara; an arrangement which secured him literary leisure, at the expense of independence. Soon after, perceiving the superior popularity of Boiardo's romance to all other kinds of poetry, he commenced his Orlando Furioso, in which he took up all the characters and situations left incomplete in the Innamorato, and brought them to a conclusion. The several years which he spent on this task were occasionally interrupted by military and diplomatic employment; but at length, in 1515, his work was printed at Ferrara, and, though not considered by himself as complete either in plan or style, met with a highly favourable reception. Soon after this he quarrelled with the Cardinal Ippolito, and accepted the protection, as it was called, of the Duke Alphonso of Ferrara; at which city he spent the most of the remainder of his life, in a small neat ornamented house, near the church of S. Benedetto, where he enjoyed the society of a lady named Alessandra, who was privately married to him, and is much celebrated in his poems. His poem was reprinted in 1516, again in 1518, and at least four other editions appeared before 1532, in all of which considerable additions and improvements were made by the author. The poem finally extended to forty-six cantos.

The external appearance of Ariosto was worthy of his eminence as a poet. He was a tall and handsome man, of slow and measured step, and a grave and contemplative aspect. His complexion was very dark, his face thin and long, his head elevated and bald on the top; and these features, aided by a pair of dark and penetrating eyes, combined to give him an appearance different from the common race of mortals. His lips were beautifully formed, and, when he smiled, expressed the soft and amiable sentiments which so often grace his descriptions; his voice was clear and harmonious, and all his gestures indicative of a lofty and affectionate disposition.

The habits of Ariosto, though in early life said to have been not free from censure, were characterised latterly by that simplicity and purity which best befits the man of eminent intellect. He was fond of gardening, but so ignorant or so inattentive as often to mistake one flower for another. He was so abstracted at meal-times, as finally, by eating over-fast, to bring on indigestion; and it was possible to make him eat things by no means agreeable to the palate, instead of others which he had been promised, without his perceiving the difference. It is said that in one of these fits of absence he neglected to ask a guest to partake of the viands set before them, but, falling to himself, quickly devoured the whole, without ever perceiving that his friend was sitting unregaled. Another grotesque anecdote is related of him. It seems that his poetry soon became as well known to the common people as that of Dante and Petrarch, and was every where sung in snatches, often, it may be supposed, without any great attention to correctness. Ariosto, one day passing a potter's shop, heard a passage so dreadfully mangled by the occupant, that he fell into a great rage, and with his stick demolished a quantity of the poor man's sherds, saying, when the potter complained of the injury, "What, varlet! I have broken but half a dozen of your base pots, not worth so many halfpence, but you have broken and mangled a fine stanza of mine, worth a mark of gold!" Another anecdote, strikingly illustrative of the esteem he acquired by his productions, may be here related. Having been appointed by his friend the duke to govern a disorderly province, which was much infested by smugglers and banditti, he had the misfortune one day to wander, in a fit of absence, and without any attendant, into the very midst of one of the hordes which he had been sent to put down. In all probability he would have been very ill used, or perhaps murdered, if one of them had not known him, and proclaimed his name to the rest. The chief immediately approached him with the greatest respect, and told him, since he was the author of the Orlando Furioso, the company, so far from injuring him, would form a guard of honour to conduct him back to his castle. They did so, entertaining him all the way with the various excellencies they had discovered in the poem, and bestowing upon it the most rapturous praises.

Ariosto died on the 6th of June 1533, in the fifty-ninth year of his age, and was buried in the church of S. Benedetto, at Ferrara, where a splendid monument was afterwards erected to his memory. It is related that Joseph the Second, Emperor of Germany, more than two centuries after, had occasion to pass through this city; and though he had hardly time for refreshment, he spent an hour in showing his respect for the poet by a visit to his tomb. In the age immediately following the death of Ariosto, there was not, according to the report of Bernardo Tasso, "an artizan, nor a boy, nor girl, nor an old man, who had not read the Orlando over and over again; its stanzas formed the comfort of the lonely traveller, who relieved the toil of his cold and weary journey by singing them as he went; and persons might be heard repeating them in every street and field."

According to Mr Stebbing, to whose labours we have been so much indebted, "no poem exists more richly deserving the popularity it has enjoyed through successive generations. Imagination never gave birth to a greater or more splendid variety of scenes, incidents, and characters, and never did poet hold the minds of his readers more completely captive by the charm of his song. At one time, we seem carried by some magic car over wide-stretching countries, varied with every wonder and glory of nature; at others led by a hermit, or the singing of a solitary bird, through green and quiet dells; then again, transported through the air, and making our passage amid gorgeous clouds, we find ourselves on tented battle fields, or surrounded by throngs of dames or barons, in the hall of some lordly castle. Nor does the charm of the poet consist only in this wild variety and brilliancy of the objects with which it regales the fancy. Both the sentiments and incidents are often exquisitely tender and impassioned: gaiety and splendour give way to pathos, and the music of the verse becomes as deep and plaintive as it was before light and flowing."

This beautiful, but, in our opinion, irregular poem, has been thrice translated into English—first, in the seventeenth century by Sir John Harrington; next, in the latter part of the last century by Mr Hoole; and, finally, in our own day by Mr Stewart Rose. The first of these versions is now antiquated; the second is in the cold stiff epics of the reign of George the Third, and gives no adequate idea of the glowing descriptions of Ariosto. In the third, there is alone to be found a fair representation of the feeling and spirit of the original.

THE LAST WILL AND TESTAMENT,

A TALE.

From the German of Richter.

SINCE the day when the town of Haslau first became the seat of a court, no man could remember that any one event in its annals (always excepting the birth of the hereditary prince) had been looked for with so anxious a curiosity as the opening of the last will and testament left by Van der Kabel. Seven distant surviving relatives of seven distant relatives deceased, of the said Van der Kabel, entertained some little hopes of a place amongst his legatees, grounded upon an assurance which he had made, "that, upon his oath, he would not fail to remember them in his will." These hopes, however, were but faint and weakly; for they could not repose any extraordinary confidence in his good faith—not only because, in all cases, he conducted his affairs in a disinterested spirit, and with a perverse obstinacy of moral principle, whereas his seven relatives were mere novices, and young beginners in the trade of morality—but also because, in all these moral extravagances of his (so distressing to the feelings of the sincere rascal), he thought proper to be very satirical, and had his heart so full of odd caprices, tricks, and snares, for unsuspicious scoundrels, that (as they all said) no man who was but raw in the art of virtue could deal with him, or place any reliance upon his intentions. Indeed, the covert laughter which played about his temples, and the falsetto tones of his sneering voice, somewhat weakened the advantageous impression which was made by the noble composition of his face, and by a pair of large hands, from which were daily dropping favours little and great, benefit-nights, Christmas-boxes, and New Year's gifts: for this reason it was, that, by the whole flock of birds who sought shelter in his boughs, and who fed and built their nests on him, as on any wild service-tree, he was, notwithstanding, reputed a secret magazine of springs; and they were scarce able to find eyes for the visible berries which fed them, in their scrutiny after the supposed gossamer snares.

In the interval between two apoplectic fits, he had drawn up his will, and had deposited it with the magistrate. When he was just at the point of death, he transferred to the seven presumptive heirs the certificate of this deposit; and even then said, in his old tone, how far it was from his expectation, that, by any such anticipation of his approaching decease, he could at all depress the spirits of men so steady and sedate, whom, for his own part, he would much rather regard in the light of laughing than of weeping heirs: to which remark one only of the whole number, namely, Mr Harprecht, inspector of police, replied as a cool ironist to a bitter one, "that the total amount of concern and of interest, which might severally belong to them in such a loss, was not (they were sincerely sorry it was not) in their power to determine."

At length the time is come when the seven heirs have made their appearance at the town-hall, with their certificate of deposit; namely, the ecclesiastical counsellor Glantz; Harprecht, the inspector of police; Neupeter, the court agent; the court-fiscal, Knoll; Pasvogel, the bookseller; the reader of the morning lecture, Flacks; and Monsieur Flitte, from Alsace. Solemnly, and in due form, they demanded of the magistrate the schedule of effects consigned to him by the late Kabel, and the opening of his will. The principal executor of this will was Mr Mayor himself: the sub-executors were the rest of the town-council. Thereupon, without delay, the schedule and the will were fetched from the register office of the council, to the council-chamber; both were exhibited in rotation to the members of the council and the heirs, in order that they might see the privy seal of the town impressed upon them: the registry of consignment, indorsed upon the schedule, was read aloud to the seven heirs by the town-clerk; and by that registry it was notified to them that the deceased had actually consigned the schedule to the magistrate, and entrusted it to the corporation-chest; and that, on the day of consignment, he was still of sound mind; finally, the seven seals, which he had himself affixed to the instrument, were found unbroken. These preliminaries gone through, it was now (but not until a brief registry of all these forms had been drawn up by the town-clerk) lawful in God's name that the will should be opened and read aloud by Mr Mayor, word for word, as follows:—

"I, Van der Kabel, on this 7th of May 179—, being in my house, at Haslau, situate in Dog Street, deliver and make known this for my last will; and without

many millions of words, notwithstanding I have been both a German notary and a Dutch schoolmaster. Howsoever I may disgrace my old professions by this parsimony of words, I believe myself to be so far at home in the art and calling of a notary, that I am competent to act for myself as a testator in due form, and as a regular devisor of property.

"It is a custom with testators to premise the moving causes of their wills. These, in my case, as in most others, are regard for my happy departure, and for the disposal of the succession to my property—which, by the way, in the object of a tender passion in various quarters. To say any thing about my funeral, and all that, would be absurd and stupid. This, and what shape my remains shall take, let the eternal sun settle above, not in any gloomy winter, but in some of his most verdant springs.

"As to those charitable foundations, and memorial institutions of benevolence, about which notaries are so much occupied, in my case I appoint as follows:—To three thousand of my poor townsmen, of very class, I assign just the same number of florins, which sum I will that, on the anniversary of my death, they shall spend jovially in feasting, upon the town common, where they are previously to pitch their camp, unless the military camp of his serene highness be already pitched there, in preparation for the reviews; and when the gala is ended, I would have them cut up the tents into clothes. Item, to all the schoolmasters in our principality I bequeath one golden Augustus. Item, to the Jews of this place I bequeath my pew in the high church. As I would wish that my will should be divided into clauses, this is to be considered the first.

"Amongst the important offices of a will, it is universally agreed to be one, that from amongst the presumptive and presumptuous expectants, it should name those who are, and those who are not, to succeed to the inheritance; that it should create heirs, and should destroy them. In conformity to this notion, I give and bequeath to Mr Glantz, the counsellor for ecclesiastical affairs; as also to Mr Knoll, the exchequer officer; likewise to Mr Peter Neupeter, the court agent; item, to Mr Harprecht, director of police; furthermore, to Mr Flacks, the morning-lecturer; in like manner to the court bookseller, Mr Pasvogel; and finally, to Monsieur Flitte—nothing: not so much because they have no just claims upon me—standing as they do, in the remotest possible degree of consanguinity—nor again, because they are, for the most part, themselves rich enough to leave handsome inheritances; as because I am assured, indeed I have it from their own lips, that they entertain a far stronger regard for my insignificant person than for my splendid property; my body, therefore, or as large a share of it as they can get, I bequeath to them."

At this point, seven faces, like those of the seven sleepers, gradually elongated into preternatural extent. The ecclesiastical counsellor, a young man, but already famous throughout Germany for his sermons printed or preached, was especially aggrieved by such offensive personality; Monsieur Flitte rapped out a curse that rattled even in the ears of magistracy: the chin of Flacks, the morning-lecturer, gravitated downwards into the dimensions of a patriarchal beard; and the town-council could distinguish an assortment of audible reproaches to the memory of Mr Kabel, such as prig, rascal, profane wretch, &c. But the mayor motioned with his hand; and immediately the fiscal and the bookseller recomposed their features, and set their faces like so many traps, with springs and triggers, all at full cock, that they might catch every syllable; and then, with a gravity that cost him some efforts, his worship read as follows:—

"Excepting always, and be it excepted, my present house in Dog Street; which house, by virtue of this third clause, is to descend and to pass in full property, just as it now stands, to that one of my seven relatives above mentioned, who shall, within the space of one half hour (to be computed from the reciting of this clause), shed, to the memory of me his departed kinsman, sooner than the other six competitors, one, or, if possible, a couple of tears, in the presence of a respectable magistrate, who is to make a protocol thereof. Should, therefore, all remain dry, in that case the house must lapse to the heir general, whom I shall proceed to name."

Here Mr Mayor closed the will: doubtless he observed the condition annexed to the bequest was an unusual one, but yet in no respect contrary to law: to him that wept the first the court was bound to adjudge the house: and then, placing his watch on the session table, the pointers of which indicated that it was now just half-past eleven, he calmly sat down, that he might duly witness, in his official character of executor, assisted by the whole court of aldermen, who should be the first to produce the requisite tear or tears on behalf of the testator.

That since the terraqueous globe has moved or existed, there can ever have met a more lugubrious congress, or one more out of temper and enraged, than this of Seven United Provinces, as it were, all dry and all confederated for the purpose of weeping, I suppose no impartial judge will believe. At first some invaluable minutes were lost in pure confusion of mind, in astonishment, and in the merriest peals of laughter. The congress found itself too suddenly translated into the condition of the dog, to which, in the very moment of his keenest assault upon some object of his appetites, the fiend cried out, Halt! whereupon, standing up, as he was, on his hind legs, his teeth grinning, and snarling with the fury of desire, he halted, and remained petrified. From the graspings of hope, however distant, to the necessity of weeping for a wager, the congress found the transition too abrupt and harsh.

One thing was evident to all, that, for a shower that was to come down at such a full gallop, for a baptism of the eyes, to be performed at such a hunting pace, it was vain to think of raising up any pure water of grief: no hydraulics could effect this; yet, in twenty-six minutes (four unfortunately were already gone), in one way or other, perhaps, some business might be done.

"Was there ever such a ridiculous act?" said the merchant Neupeter; "such a piece of buffoonery enjoined by any man of sense and discretion? For my part, I can't understand what it means." However, he understood thus much, that a house was by possibility floating in his purse upon a tear; and *that* was enough to cause a violent irritation in his lachrymal glands.

Knoll, the fiscal, was screwing up, twisting, and distorting his features pretty much in the style of a poor artizan on Saturday night, whom some fellow-workman is barber-ously razoring and scraping by the light of a cobbler's candle: furious was his wrath at this abuse and profanation of the title Last Will and Testament; and, at one time, poor soul, he was near enough to tears—of vexation.

The wily bookseller, Pasvogel, without loss of time, sat down quietly to business; he ran through a cursory retrospect of all the works any ways moving or affecting, that he had himself either published or sold on commission; took a flying survey of the Pathetic in general; and in this way of going to work he had fair expectations that in the end he should brew something or other; as yet, however, he looked very much like a dog who is slowly licking off an emetic which the Parisian surgeon Demet has administered, by smearing it on his nose—time, gentlemen, time was required for the operation.

Monsieur Flitte, from Alsace, fairly danced up and down the sessions-chamber: with bursts of laughter he surveyed the rueful faces around him: he confessed that he was not the richest among them; but, for the whole city of Strasburg and Alsace to boot, he was not the man that could or would weep on such a merry occasion. He went on with his unseasonable laughter and indecent mirth, until Harprecht, the police inspector, looked at him very significantly, and said, that perhaps Monsieur flattered himself he might, by means of laughter, squeeze or express the tears required from the well-known Meibomian-glands, the caruncula, &c., and might thus piratically provide himself with surreptitious rain; but in that case he must remind him that he could no more win the day with any such secretions, than he could carry to account a course of sneezes, or wilfully blowing his nose; a channel into which it was well known that very many tears, far more than were now wanted, flowed out of the eyes through the nasal duct; more, indeed, by a good deal, than were ever known to flow downwards to the bottom of most pews at a funeral sermon. Monsieur Flitte of Alsace, however, protested that he was laughing out of pure fun, and for his own amusement, and, upon his honour, with no ulterior views.

The inspector, on his side, being pretty well acquainted with the hopeless condition of his own dephlegmatised heart, endeavoured to force into his eyes something that might meet the occasion, by staring with them wide open, and in a state of rigid expansion.

The morning-lecturer, Flacks, looked like a Jew beggar mounted on a stallion which is running away with him. Meantime, what by domestic tribulations, what by those he witnessed at his own lecture, his heart was furnished with such a promising bank of heavy laden clouds, that he could easily have delivered upon the spot the main quantity of water required, had it not been for the house which floated on the top of the storm; and which, just as all was ready, came driving in with the tide, too gay and gladsome a spectacle not to banish his gloom, and thus fairly dammed up the waters.

The ecclesiastical counsellor, who had become acquainted with his own nature by his long experience in preaching funeral sermons, and sermons on the new-year, and knew full well that he was himself always the first person, and frequently the last, to be affected by the pathos of his own eloquence, now rose with dignified solemnity, on seeing himself and the others hanging so long by the dry rope, and addressed the chamber:—No man, he said, who had read his printed works, could fail to know that he carried a heart about him as well as other people; and a heart, he would add, that had occasion to repress such holy testimonies of its tenderness as tears, lest he should thereby draw too heavily on the sympathies and the purses of his fellow-men, rather than elaborately to provoke them by stimulants for any secondary views, or to serve an indirect purpose of his own. "This heart," said he, "has already shed tears (but they were shed secretly), for Kabel was my friend:" and, so saying, he paused for a moment, and looked about him.

With pleasure he observed that all were still sitting as dry as corks; indeed, at this particular moment, when he himself, by interrupting their several water-works, had made them furiously angry, it might as well have been expected that crocodiles, fallow-deer, elephants, witches, or ravens, should weep for Van der Kabel, as his presumptive heirs. Among them all, Flacks was the only one who continued to make way: he kept steadily before his mind the following little extempore assortment of objects:—Van der Kabel's good and beneficent acts; the old petticoats, so worn and tattered, and the grey hair of his female congregation at morning service; Lazarus with his dogs; his own long coffin; innumerable decapitations; the Sorrows of Werter; a miniature field of battle; and, finally, himself and his own melancholy condition at this moment, itself enough to melt any heart, condemned as he was in the bloom of youth, by the second clause of Van der Kabel's will, to tribulation, and tears, and struggles: Well done, Flacks! Three strokes more with the pump-handle, and the water is pumped out—and the house along with it.

Meantime Glantz, the ecclesiastical counsellor, proceeded in his pathetic harangue:—"O, Kabel, my Kabel," he ejaculated, and almost wept with joy at the near approach of his tears, "the time shall come that by the side of thy loving breast, covered with earth, mine also shall lie mouldering and in cor—"

—*ruption*, he would have said; but Flacks, starting up in trouble, and with eyes at that moment overflowing, threw a hasty glance around him, and said, "with submission, gentlemen, to the best of my belief I am weeping;" then sitting down with great satisfaction, he allowed the tears to stream down his face; that done, he soon recovered his cheerfulness and his *aridity*. Glantz, the counsellor, thus saw the prize fished away before his eyes: this vexed him; and his mortification was the greater on thinking of his own pathetic exertions, and the abortive appetite for the prize which he had thus uttered in words as ineffectual as his own sermons; and, at this moment, he was ready to weep for spite—and "to weep the more because he wept in vain." As to Flacks, a protocol was immediately drawn up of his watery compliance with the will of Van der Kabel; and the messuage in Dog Street was knocked down to him for ever. The mayor adjudged it to the poor devil with all his heart: indeed, this was the first occasion ever known in the principality of Haslau, on which the tears of a schoolmaster and a curate had converted themselves—not into mere amber, that incloses only a worthless insect, like the tears of the Heliades, but, like those of the goddess Freia, into heavy gold. Glantz congratulated Flacks very warmly, and observed, with a smiling air, that possibly he had himself lent him a helping hand by his pathetic address. As to the others, the separation between them and Flacks was too palpable, in the mortifying distinction of *wet* and *dry*, to allow of any cordiality between them; and they stood aloof therefore: but they staid to hear the rest of the will, which they now awaited in a state of anxious agitation.

AN ENGLISH RURAL PARISH.

In the county of Bucks, there is a small parish, named Cholesbury, in which the evils consequent on the present system of the poor-laws are exemplified in the highest possible degree. This parish, it seems, possesses a population of one hundred and thirty-nine individuals, out of which only thirty-five support themselves; sixty-six are parishioners receiving relief from the poor-rates, and thirty-eight are resident paupers receiving relief from their own parishes. Sixty years since, only one person received relief from the parish. Now, the above is the case, and the sum at present required as poor-rates amounts to no less than L.367, 4s. annually. Even so late as 1801, the amount of poor-rates was but L.37 a-year: the rapid progression in the present instance towards universal pauperism, is therefore absolutely frightful. In the list of those now on the poor roll, we perceive whole families—husband, wife, and children, each with their allotted sums. One family of six individuals (one of which is an infant of a year old) gets 9s. 6d. a-week, or L.24, 14s. annually; another family of four gets 7s. a-week; from 8s. to 9s. seems the ordinary weekly payment to families; and from 3s. to 4s. that which is given to single persons; a boy or girl of ten or eleven years of age gets 2s. About October last year, the parish officers, not being able to collect any more funds, threw up their books, and their duties fell upon the clerical incumbent. The income of this gentleman is under L.140 a-year; yet such have been the exigencies of the parish, that he has been obliged to commence supporting the paupers by daily allowances of bread, potatoes, and soup. But this source also failing, he was necessitated to apply to the magistrates at the petty and special sessions, for grants of money from other parishes, and which are called "rates in aid." These rates in aid (of perhaps L.50 at a time) have also failed: additional exactions are laid on the property in the parish; and the result at length ensues, of the land being abandoned by farmers and other cultivators. Nobody will take the land for nothing. The only ground now cultivated in the parish amounts to sixteen acres, including cottage gardens. By the account of the incumbent, communicated to the poor law commissioners (from whose report we draw this information), the moral and physical condition of the population is getting daily worse. "The poor-laws (says he) have produced so much dependence and improvidence among them, that if,

for a few weeks only, when the funds are exhausted, they are deprived of parish aid, they incur debts, and become behind hand in their rents, and, to avoid discharging it, voluntarily quit a comfortable cottage for one much less so: thus a spirit of recklessness and dishonesty is promoted, detrimental to the moral character of the very best of them. I confess I now see no prospects whatever of the parish being relieved from its present degraded and impoverished state." What a melancholy picture of human wretchedness we are here presented with!—the land of a parish in a rural district of England, literally abandoned by cultivators, in dread of the excessive burden of the poor-rates, and the chief part of the population reduced to the character of dependent paupers! Can such a thing actually be in a country so long popularly known by the title of Merry England?

FORMATION OF SCOTTISH SOCIETY.

Continuing our series of papers on this interesting subject from the thirty-first number of the Journal, the next family of foreign extraction which we have to notice as settlers in Scotland, is that of *Durham*. The Durhams derive their name from the city of that name in the north of England, where they had long been settled; and it is ascertained, from records, that they immigrated into Scotland, where they took root, in the early part of the thirteenth century, in the reign of William the First, surnamed the Lion. The *Montfichets* settled in Scotland, also, in the reign of William the First, and obtained lands in Perthshire. In the course of subsequent ages, this family has allowed its appellation to be transformed into the by no means elegant name *Muschet*. The *Bissets* or *Bysets* came from England about the same remote period, and settled in two branches, the one in Morayshire, and the other in Berwickshire. One of the families of this surname, most likely the last mentioned, was concerned in the infamous murder of the Earl of Athole, at Haddington, in East Lothian, in the year 1242.

The gallant family of the *Chenes*, or *Cheynes*, a name distinguished in Scottish warlike history, was likewise of Anglo-Norman lineage, and settled soon after the beginning of the thirteenth century, but their chief line became extinct in the fourteenth. The widely-spread family of the *Grants* were undoubtedly of Anglo-Norman descent, although the genealogists contend for a Celtic original. In the reign of William the Conqueror, there were Grants in various public employments; from England they came into Scotland, and the first who appears in the records of this country were Laurence Grant and Robert Grant, the sons of Gregory le Grant, who married Mary Byset, the daughter of Byset of Lovet. This transaction must have taken place about the years 1250–60. The *Aytons* are among the oldest and most respectable families in Scotland. They are of Anglo-Norman descent, and were originally called by the name of *De Vesci;* but a branch settling at Eytown, a place on the small river Eye, in Berwickshire, the family surname was in time changed to Eyton or Ayton. The Aytons of Inchdairney, in Fife, are, it is understood, the lineal descendants of these Anglo-Norman De Vescis. The *Campbells* are, in the same manner, of Anglo-Norman descent. Their progenitors came into Scotland in the twelfth century; the principal stem, by marrying the heiress of O'Dubhin, a Gaelic chief, obtained along with her the lands of Lochow, in Argyleshire, and laid the foundation of the potent clan Campbell, which has till this day its head-quarters in Argyleshire, and which has its branches among all classes in all parts of the country.

We have thus taken a rapid view of the settlement of Anglo-Saxon and Anglo-Norman families, as can be substantiated by the charters still preserved; although the list of immigrants is far from complete, and might be extended much farther, there being a vast number of families in Scotland of the same foreign lineage—as for instance the *Bertrams* or *Bertrands*, the *Ainslies* or *Angelos*, the *Chamberses* or *de la Chambres*. The last of these names is in Scotland generally spelt "Chalmers," in conformity with the old orthography and pronunciation of the ordinary word from which the name is derived. Enough has been given to show how Scotland acquired the use of the English tongue and the English manners. Many humble attendants followed the various heads of families into the country, whose names, from their obscurity, are now unknown, but who equally contributed to fix the predominance of the Anglo-Normans.

Scotland was not alone indebted to this great infusion of the companions of the Norman conqueror and their descendants, for the foreign usages which it adopted. During the twelfth century, it received almost as large accessions by the introduction of Flemings, or Anglo-Belgians, from which race of foreigners, it has been mentioned, the noble race of Douglas drew its first blood. Flemish people arrived in England in great numbers in the reigns of William Rufus and Henry the First,; and, during the civil wars of Stephen, they were found useful as stipendiary soldiers. On the accession of Henry the Second, in 1154, he banished the Flemings, as well as other foreign adventurers; and these fleeing into Scotland, there received settlements, and in many cases acted as the hired troops of the sovereign. This description of colonists were of two classes—a high and a low, or the military adventurer and the humble artizan. Those who distinguished themselves by the sword, received grants of lands, and founded a number of families of rank and respectability. The places of residence of these fortunate soldiers were sometimes called *Flemington*, from their national denomination, and under that name they can still be pointed out in various parts of Scotland. The inferior class of Flemings settled chiefly in villages and towns, where their acts could be turned to account; though, such was the rigour of the corporation laws, and the ignorance of the craftsmen, that such was not always easily accomplished. An immense number of Flemings settled in the eastern part of Aberdeenshire, where, indeed, they affected the intonation of the speech, and, as it is understood, introduced that peculiarity of tongue now described as *Broad Buchan*. The Flemings of a higher rank can nowhere be so well traced as in Dumfriesshire and Galloway, especially the former, in the district of Annandale, where they originated the clan *Jordan*, or *Jardine*. The Flemings, Earls of Wigton, were descended from Baldwin, a Fleming, who obtained the lands of Biggar, in Upper Clydesdale, under a grant of David the First. The Flemings penetrated into the province of Moray, where one of their principal men, Berowald by name, obtained a grant of certain lands called *Innes*, from Malcolm the Fourth, and hence his descendants assumed the name of *Innes*. But perhaps the greatest of all the Flemish settlers in the reign of David the First, was Freskin, who obtained the lands of Strathbrock, in Linlithgowshire (now called Brocks, or Broxburn.) Luckily for this foreigner, a rebellion broke out in Moray, in the year 1130, which having assisted in quelling, he was rewarded with a large tract of land in the lowlands of Moray, where his descendants settled, and shortly dropping the appellation of Freskin, assumed in its stead that of *Moray* or *Murray*, which has been since retained by their noble line of posterity—the house of Moray, and innumerable families branching from it.

In thus describing the introduction of distinguished foreigners into Scotland, it has been shown, that in nearly all cases they took their surnames or family names from their places of settlement, from whence it appears that local names connected with lands have ever been esteemed the most honourable. Surnames first began to be used in France about the end of the tenth century; from France they progressed into England, but did not make their appearance in Scotland till the beginning of the twelfth century, or the reign of David the First, and became general before the conclusion of the thirteenth. Fashion, as much as convenience, dictated the assumption of surnames. It was at first a mark of rank, or of being connected with landed property, the word *de* being ordinarily appended to the name. A considerable time elapsed in France, England, and Scotland, before the common people took family names, it being not till the recent period of Edward the Second that they were assumed in England by the working classes; and as late as 1339, the peasants of France had no surnames. The first time that surnames were written in Scotland, in subscribing names, was in the *Inquisitio Davidis*, 1116, in which *Gervase Riddel* and *Robert Corbet* were witnesses. Riddel and Corbet are thus the two oldest surnames of which there is any trace in Scottish records. After this period, they came into use by the landholders taking, as has been seen, the appellations of their property. The middle and lower ranks, who had no lands, assumed surnames from their professions—as Smith, Wright, Hunter, &c.—or from the name of their father, with the addition of *son*, as Williamson, Johnson, Robertson, &c., a custom already sanctioned by the Celtic tribes, who used their patronymics—as MacDougal, MacPherson, &c. Others adopted or were given surnames from the colour of their visage—as Brown, Black, White, &c., while some were otherwise descriptive of the mental or personal character. In some instances, those of English extraction took the name of *English*, which in all cases has since been simplified to *Inglis*.

In this manner did the whole of the Scottish Lowlanders acquire their surnames before the end of the thirteenth century, though, from various capricious circumstances, a number of names have been conferred since that period. It is remarkable that it was long before married women assumed or were given their husbands' names; and it is still more strange, that, in some parts of Scotland, they are till the present time called by their own maiden names in preference to that of their husbands.

In closing this desultory sketch of the causes and effects of the great revolution in Scotland in the eleventh, twelfth, and thirteenth centuries, the writer may be permitted the single remark, that a knowledge of such facts ought to lead the Scotch into a train of thinking in which they by no means indulge. They are in the habit of proclaiming, *that their country was never conquered;* it is hoped they will much more correctly boast of Scotland being subjected to the yoke of foreign aggression, *but that they are the descendants of the conquerors.*

RECKONING OF TIME.

In the civilised part of the world, it is now customary to reckon time by seconds, sixty of which constitute minute—minutes, sixty of which constitute an hour—hours, twenty-four of which make a day—days, of which 365 or more form a year—and years, as numbered from the period of the birth of Jesus Christ. The year has been pitched upon by mankind to signify a space of time, because it requires such a space for the earth to go round the sun, and the seasons to be completed. The month has its origin in the revolution of the moon round the earth; though, among civilised nations, a somewhat longer time than what is necessary for that purpose is now assigned to the month. The day, being that period which suffices for the revolution of the globe on its own axis, and the phenomena of which are most familiar to man, and most immediately necessary for his support and for the support of nature, was probably the first natural period of time reckoned by the human race. These three periods are all natural: what remain are artificial—for there is nothing in the world which points out the division of days into hours, hours into minutes, or minutes into seconds.

It must have always been obvious to mankind, that a day consisted of a complete revolution of the sun from one point of the sky back to that point again; but at what point the commencement of the day was to be fixed, must have been a matter less easily settled. Accordingly, among ancient nations, the Babylonians, Persians, Jews, Greeks, and almost all the nations of Asia, commenced the day at sunrise, and considered it as lasting throughout the whole of the ensuing daylight and darkness; an arrangement which would answer better in countries near the tropics than elsewhere, as the sun there rises more nearly about the same time throughout the whole year. The Arabians began their day at noon, as do the astronomers of all nations; while the ancient Egyptians, and all modern European nations, along with the modern Chinese, commence it at midnight, which is evidently the most convenient plan, seeing that it throws all the waking and active part of the day under one date. Most nations have their clocks marked for only twelve hours; but the Italians run them on from the first hour to the twenty-fourth.

The recurrence of seasons must have instructed mankind at a very early period as to the length of the year, though not very correctly. Astronomy, however, was a very early science, and, accordingly, the fact, that a year lasts 365 days and some odd hours, seems to have been ascertained at a very remote period. The principal difficulty was to obtain a starting-point from which to number the years. The era of the creation was not known, or could only be guessed at, at a comparatively late period, from the ages of the patriarchs in the Jewish scriptures. But even the Jews did not reckon from the creation till about four hundred years ago. The first mode of reckoning years that we know of, was that of the Olympiads, which took its rise among the Greeks 776 years before the birth of Christ. Public games had been instituted at Olympia, a city in Elis, which took place at every fifth recurrence of the full moon after the summer solstice, namely, about the beginning of our July. As this festival made a great impression on the public mind, the people began to reckon by Olympiads, or recurrences of the Olympic games—an Olympiad comprising four years. The supposed era of the birth of Christ (for this is not an exactly settled matter), took place about the middle of the last year of the 195th Olympiad. The Romans, on the other hand, reckoned from the foundation of their city, which took place, as of late precisely ascertained, 753 years before the birth of Christ. The Greeks latterly adopted a new era, called the Era of Seleucides, which commenced from twelve years after the death of Alexander the Great, in whose honour it was instituted. The Jews reckoned by this era till the fifteenth century, and still begin their year, according to it, some time in the month of September or October. There are some other eras, which were adopted by heathen nations; but they are hardly worth notice in this place.

The Christian Era, of which we now live in the eighteen hundred and thirty-third year, was not adopted as a reckoning of time immediately after the commencement of Christianity. That religion existed long in a very obscure way, and the date of the birth of its founder did not, for several centuries, become a sufficiently important event in the eyes of enlightened nations to cause them to make it an era. The eras of the Olympiads, the founding of Rome, the death of Alexander the Great, and the dates of ecclesiastical councils, and other events then considered of importance, were the common modes of reckoning, and continued to be partially so till a period less remote than many people suppose. Even in Italy, which early became the chief seat of Christianity, this era was not used till the sixth century. It was introduced into

France in the seventh, but not fully established till the eighth century; in Spain, though occasionally adopted in the eleventh, it was not uniformly used in public instruments till after the middle of the fourteenth, nor in Portugal until about the year 1415.

The commencement of the year was also, till a comparatively late period, the subject of no general rule. Christmas day; the day of the Circumcision, the 1st of January; the day of the Conception, the 15th of March; and Easter day; have all been used at various times, and by various nations, as the initial day of the year. Christmas day was the ecclesiastical beginning of the year, till Pope Gregory the Thirteenth, who reformed the calendar, ordered it, in 1582, to begin thenceforward on the 1st of January. In France and England, the same practice commenced about the same time; but, in the latter country, it was not till 1752 that legal writs and instruments ceased to consider the 25th of March as the beginning of the year. In Scotland, New Year's day was altered both for historical and legal purposes, from the 25th of March to the 1st of January, by a proclamation of King James the Sixth, in the year 1600. The English plan was found exceedingly inconvenient; for, when it was necessary to express a date between the 1st of January, which was the commencement of the historical year, and the 25th of March, which opened the legal one, error and confusion was sure to occur, unless it were given in the following awkward fashion—January 30, 1648–9, or $164\frac{8}{9}$. Even this was apt to lead to mistakes; and it is perhaps, even to this day, a matter of doubt with some intelligent persons, whether the execution of Charles the First, of which the above is the usual appearance of the date, occurred in the year 1648 or 1649: it in reality occurred in the year which, by our present uniform mode of reckoning, would be called 1649. Many of our readers will no doubt be startled to think, that, so lately as 1753, a mode of beginning the year on the 25th of March existed in England; but we point for a familiar illustration of the fact to the list of months which used to be so common on Bibles, where they will see March put at the head.

The division of the year into months is a matter which must have early occupied the attention of mankind. There were about thirteen revolutions of the moon in a year, and, accordingly, this was the earliest number of months. It appears, however, that many of even the ancient nations had arrived at a mode of dividing the year into twelve months, probably to suit the twelve signs of the zodiac. There was no very near approximation to the exact space of a year till Julius Cæsar, forty-five years before Christ, ordained that in general it should consist of 365 days, and that, to make up for the extra eight hours, which he believed to be the completion of the earth's revolution, the day corresponding to our 24th of February should be reckoned twice at the end of every three years. Cæsar's mistake was discovered thirty-seven years after; and six hours being then determined as the extra space, the twice-reckoned day was ordained to happen only once in four years. From the year of Christ 7, this way of reckoning was undisturbed, till, in the year 1582, Pope Gregory already mentioned resolved to reclaim the ten days which had in the meantime come into existence, through a failure to observe that the year consisted of twelve minutes and three seconds less than 365 days six hours. After deep study and calculation, this pontiff ordained that ten days should be deducted from the year 1582, by calling what, according to the old calendar, would have been reckoned the 5th of October, the 15th of October 1582. In Spain, Portugal, and part of Italy, the Pope was exactly obeyed. In France, the change took place in the same year, by calling the 10th the 20th of December. In the Low Countries, the change was from the 15th December to the 25th, but was resisted by the Protestant part of the community till the year 1700. The Catholic nations in general adopted the *style* ordained by their sovereign pontiff, but the Protestants were then too much inflamed against Catholicism in all its relations, to receive even a purely scientific improvement from such hands. The Lutherans of Germany, Switzerland, and, as already mentioned, of the Low Countries, at length gave way in 1700, when it had become necessary to omit *eleven* instead of ten days. A movement to this effect had been brought before the Parliament of England in 1585, but does not appear to have gone beyond a second reading in the House of Lords. It was not till 1751, and after great inconvenience had been experienced for nearly two centuries, from the difference of the reckoning, that an act was passed (24 Geo. II. 1751) for equalising the style in Great Britain and Ireland with that used in other countries of Europe. It was enacted, in the first place, that the historical and legal year should thenceforth be the same; that eleven days should be omitted after the 2d of September 1752, so that the ensuing day should be the 14th; and, in order to counteract a certain minute overplus of time, that "the years 1800, 1900, 2100, 2200, 2300, or any other hundreth year of our Lord which shall happen in time to come, except only every fourth hundreth year of our Lord, whereof the year 2000 shall be the first, shall not be considered as leap-years." A similar change was about the same time made in Sweden and Tuscany; and Russia is now the only country which adheres to the *old style*; which renders it necessary, when a letter is thence addressed to a person in another country, that the date should be given thus—April $\frac{1}{13}$ or $\frac{\text{June } 26}{\text{July } 9}$; for it will be observed that the year 1800 being considered by us as a leap-year, has interjected another (or twelfth) day between old and new style.

The present mode of reckoning time has experienced no interruption, in its leading features, for many years, except under the French republic. In September 1793, the French nation resolved that the foundation of their new system of government should form their era, instead of the birth of Christ, whose religion they had in a great measure shaken off, and that a calendar should be adopted on what were termed philosophical principles. The Convention therefore decreed, on the 24th of November 1793, that the common era should be abolished in all civil affairs; that the new French era should commence from the foundation of the republic, namely, on the 22d September 1792, on the day of the true autumnal equinox; that each year henceforth should begin at the midnight of the day on which the true autumnal equinox falls. This year they divided into twelve months of thirty days each, to which they gave descriptive names, as follow:—From the 22d September to the 21st of October, was Vendémaire (Vintage Month); to the 20th November, was Brumaire (Foggy Month); to the 20th December, was Frimaire (Sleety Month); this completed the autumn quarter: to the 19th January, was Nivose (Snowy Month); to the 18th February, was Pluvoise (Rainy Month); to the 20th March, was Ventose (Windy Month); which completed the winter quarter: to the 19th April, was Germinal (Budding Month); to the 19th May, was Floréal (Flowery Month); to the 18th June, was Prairial (Pasture Month); here ended the spring quarter: to the 18th July, was Messidor (Harvest Month); to the 17th August, was Fervidor or Thermidor (Hot Month); to the 16th September, was Fructidor (Fruit Month); which terminated the period of summer. In ordinary years, there were five extra days, namely, from the 17th to the 21st of our September, inclusive: these the French called Jours Complementaires or Sans-cullottides, and held as festivals; the first being dedicated to Virtue, the second to Genius, the third to Labour, the fourth to Opinion, and the fifth to Rewards. At the end of every four years, forming what they called a Franciade, occurred a leap-year, which gave a sixth complementary day, styled La Jour de la Revolution, and employed in renewing the national oath to live free or die. The *week*, though not exclusively a Christian or Jewish period of time, they also abjure. The thirty days of the month were divided into three parts of ten days each, called Decades; of which the first nine (called Primidi, Duodi, Tridi, Quartidi, Quintidi, Sextidi, Septidi, Octidi, Nonidi) were working or common days, while the tenth, styled Decadi, was observed as a kind of Sabbath, though not exactly in the Jewish sense of the word. The French, however, in indicating any particular day, either by word or writing, generally mentioned only the number of the day of the month. The Republican Calendar was first used on the 26th of November 1793, and was discontinued on the 31st of December 1805, when the calendar used throughout the rest of Europe was resumed.

BIOGRAPHIC SKETCHES.

CAPTAIN COOK.

In the list of men who have raised themselves from obscurity to an honourable reputation by the force of their genius and perseverance, few stand so conspicuous as the celebrated English navigator, Captain James Cook; a person who, by his unwearied exertions and enterprise, won for himself a distinguished place among the instructors and best benefactors of mankind.

This meritorious individual was born at the village of Marton, not far from Whitby, a sea-port on the coast of Yorkshire, on the 27th of October 1728. His parents were of an exceedingly humble rank in society: his father, who lived in the capacity of a farmer's servant, married a woman in the same sphere of life with himself; and both were noted for their honesty, sobriety, and industry—qualities that descended to their son James. Young Cook received the first rudiments of his education at Marton, where he was taught to read by the schoolmistress of the village. When he was eight years of age, his father, in consequence of his good character, obtained the situation of bailiff, or superintendant of a farm, to Thomas Scottowe, Esq. near Great Ayton, whither the family removed; and at that gentleman's expense James was put under the tuition of a schoolmaster, who instructed him in writing, and the first principles of arithmetic and book-keeping. At this period he is said to have shown a strong genius for figures, and to have made himself remarkable for the reservedness of his disposition, and the inflexibility of his temper. During this time he likewise followed the same servile employment as his father, as much as his tender years would permit: and thus laid the foundation of that hardiness of constitution for which in after-life he was so remarkable, and which may be said to have enabled him to accomplish his adventurous career.

When about sixteen years of age, Cook was bound apprentice to a shopkeeper at Snaith, a considerable fishing town about ten miles north of Whitby; but as he now began to evince a strong partiality for a maritime life, fostered no doubt by the situation of the place, after a year and a half's servitude he obtained a release from his engagements, and determined to follow the bent of his genius.

Accordingly, in 1746 he became an apprentice for three years with Messrs Walker, of Whitby, owners of the ship Freelove, a vessel constantly employed in the coal trade, on board which our navigator spent the greater part of his apprenticeship. After serving the full time to the entire satisfaction of his employers, he performed some voyages to the Baltic, in the capacity of a common sailor, till at length his masters, who had penetration to discover his talents and worth, appointed him mate, and afterwards master of one of their ships. In this employment he continued till the commencement of hostilities between Great Britain and France in 1755, when, being in the river Thames with his vessel, and finding that press-warrants were issued, he felt a spirit that disdained to be *compelled* to serve his king, and he adopted the resolution of entering the royal navy as a volunteer; "having a mind," as he expressed himself, "to try his fortune in that way."

Cook entered on board the Eagle, of sixty guns, commanded by Captain, afterwards Sir Hugh, Palliser; and that judicious officer soon perceived the merit of this excellent seaman, and granted him every encouragement compatible with the humble station which he occupied. His friends and relatives in his native country, likewise, finding his conduct deserving their patronage, generously interfered in his behalf; and through the influence of Mr Osbaldeston, M. P. for Scarborough, with the assistance of Captain Palliser, they at length procured him a master's warrant in the Mercury, and in her he soon after sailed to North America, where she joined the fleet under Sir Charles Saunders, in the memorable expedition against Quebec.

It was on this occasion that the talents of Cook were first brought into notice. During the siege, a difficult and dangerous service was to be performed. This was to take the soundings of the river St Lawrence, between the Isle of Orleans and the north shore, directly in front of the French fortified camp at Montmorency and Beauport, in order to enable the admiral to place ships against the enemy's batteries, and to cover the army in the grand attack which General Wolfe intended to make on the camp. Captain Palliser, in consequence of his acquaintance with Cook's skill and resolution, recommended him to the service, and he performed it in the most complete manner.

After the reduction of Quebec, Cook was appointed by Lord Colville, on the 22d of September 1759, master of the Northumberland, in which ship his lordship remained the following winter, as commodore at Halifax. During the leisure which the winter season afforded him, he employed his time in the acquisition of such knowledge as eminently qualified him for his future appointments. It was at Halifax that he first read Euclid, the father of mathematics, and applied himself to the study of astronomy, and other higher branches of nautical science. The assistance which he derived from books was but scanty; but his industry enabled him to supply many wants, and to make a progress far superior to what could have been expected from the few advantages he enjoyed.

In April 1760, he received a lieutenant's commission, and he continued during two years to apply himself diligently to acquire a knowledge of the North American coast, and to facilitate its navigation. His abilities as an accurate draughtsman were now so well known, that he was employed by different commanders, particularly Lord Graves, to make charts and surveys; and the unanimous voice of the best judges confirms his merit in this respect.

Towards the close of 1762, he returned to England, and married a young lady of the name of Batts, whom he tenderly loved, and who had every claim to his warmest affection and esteem. It is a singular circumstance, if it be true as reported, that he was godfather to his future wife, and, at the very time she was christened, declared that he had determined on the union which afterwards took place between them.

Early in the year 1763, after the restoration of peace, he was appointed marine-surveyor of Newfoundland, at the recommendation of his steady friend and patron, Captain, afterwards Lord Graves, who went out again as governor. This appointment he continued to fill, under successive governors, till the close of the year 1767; and he had here an opportunity of exhibiting to the Royal Society a proof of the great progress which he had made in the study of astronomy. This he did in 1766, by making an observation of an eclipse of the sun at the Island of Newfoundland, with the longitude deduced from it, which was published in the fifty-seventh volume of the Philosophical Transactions; and he now acquired reputation for his scientific, as he had formerly for his professional skill.

We come now to that period of Cook's life when he was to be known to the world as one of the most illustrious navigators that any age or nation has pro

duced. It having been calculated by astronomers that a transit of the planet Venus over the sun's disc would happen in 1769, and that the best place for observing it would be in some part of the South Seas, the Royal Society addressed a memorial to his majesty on the subject, entreating that a vessel might be ordered at the expense of government, for the conveyance of suitable persons to make the observations. To this memorial a favourable answer was returned, and the Endeavour bark, a vessel of three hundred and seventy tons, was purchased into the service for the voyage. Some difficulties occurred in the appointment of a commander; but at length Mr Stephens, Secretary to the Admiralty, mentioned Lieutenant Cook as a person whom he judged to be fully qualified for the direction of the voyage, and at the same time recommended it to the board to take the opinion of Sir Hugh Palliser, who had lately been governor of Newfoundland, and was intimately acquainted with the merit of Cook. Sir Hugh rejoiced in the opportunity of serving his friend, and, through the strength of his recommendation, it was determined that Cook should have the command of the expedition. He was appointed joint-astronomer with Mr Charles Green, a gentleman who had long been assistant to Dr Bradley, at the Royal Observatory at Greenwich; and he was also accompanied by Mr, afterwards Sir Joseph Banks, president of the Royal Society, and by Dr Solander, a Swedish gentleman, who had made much proficiency in every branch of natural history, under the instructions of the celebrated Linnæus. With the rank of captain, he sailed down the river Thames, on the 30th of July 1768, and, on the 26th of August following, he sailed from Plymouth Sound, on an expedition the most honourable to his country.

On the 13th of November, Captain Cook arrived at Rio de Janeiro, in South America; and proceeding from thence, after touching at Port Maurice, in the Streights of Le Maire, on the 13th of April 1769, he anchored in Matavia Bay, in the island of Otaheite. On the 3d of June, the transit of the planet Venus over the sun's disc was observed with great advantage. A particular account of this rare astronomical event, the providing for the accurate observation of which reflected so much honour on his majesty's munificent patronage of science, may be seen in the sixty-first volume of the Philosophical Transactions.

In the course of this voyage, Captain Cook visited the Society Islands; determined the insularity of New Zealand; sailed through the strait which separates these two islands, now called after his name; and made a complete survey of both. He afterwards explored the eastern coast of New Holland, hitherto unknown; and thus added an extent of more than two thousand miles to our geographical knowledge of the globe. On the 12th of June 1771, he came to an anchor in the Downs, after having been absent almost three years, in which time he had experienced every danger to which a voyage of such length is incident, displaying on all occasions a mind equal to the most perilous enterprises, and to the boldest and most daring efforts of navigation and discovery.

Shortly after Captain Cook's return to England, it was resolved to equip two ships to complete the discovery of the southern hemisphere. It had long been a prevailing idea that the unexplored part contained another continent, and many plausible philosophical arguments had been urged in support of this opinion. To ascertain this point was the important object of Captain Cook's second voyage. That nothing might be omitted which could tend to facilitate the enterprise, two ships were provided, equipped with uncommon care, and furnished with every necessary that could contribute to the safety, health, and comfort of the navigators. The first of these ships, commanded by Captain Cook, was called the Resolution, a vessel of four hundred and sixty-two tons burthen; the other, the Adventure, of three hundred and thirty-six tons, was commanded by Captain Tobias Furneaux.

He sailed from England on the 9th of April 1772; on the 25th of January 1774, arrived within the southern frozen zone; and on the 30th of January, he reached the latitude of 71° 10′ south; but all attempts to penetrate farther to the southward being found absolutely impracticable, he was obliged to relinquish the attempt. This latitude, to the extent of three degrees, has been since passed by Captain Weddell, in 1823.

Cook returned to England from this his second voyage, in July 1774, and was received with marked honours. He might now have retired from all future toil; but he was reserved for yet far greater exertions, and doomed, through savage barbarity, to lose a life of the greatest value to society. For a number of years it had been a favourite scheme with navigators to discover a shorter and more commodious passage to the East Indies than by the Cape of Good Hope. Cook's mind was fired with the magnitude of such a design, and the consequences likely to result from it. Under a noble enthusiasm, he offered his services in the conducting of the expedition; no proposal could have been more grateful, and he was invested with the command. The vessels destined for this service were the Resolution and the Discovery—the former being given to Cook, the latter to Captain Clerke. The instructions were to seek out a path from the Pacific to the Atlantic, by way of the clusters of islands Cook had before visited within the southern tropic. The ships left the English Channel in July 1776. The particulars of this interesting voyage our readers are most likely already acquainted with. It will be remembered that Cook proceeded by way of the Cape of Good Hope, Van Dieman's Land, New Zealand, the Friendly and Society Islands, and from thence northwards along the west coast of America, till he was prevented from sailing round the northern extremity of Asia by the approach of winter. He now returned southwards to the Sandwich Islands, in the Pacific, with the intention to remain till summer; but here his enterprise was arrested. When at the Island of Owhyhee, a quarrel arose between the natives and the ship's crews, which led to a sort of skirmish or hurried fight. In endeavouring to quell the disturbance, when on shore, he was stabbed in the back, and fell with his face into the water. This melancholy event occurred on the 14th of February 1779. The intelligence was received, not only in Britain, but throughout Europe, with general lamentation, and various honours were justly paid to his memory, both by public bodies and private individuals.

NEW SOUTH WALES.

In addition to the comprehensive account of the colony of New South Wales, forming a number of our "Information for the People," the following sketch from the *New South Wales Calendar* for the year 1833, may be perused with advantage by intending emigrants and others.

"In this important colonial possession, the rising up of towns and villages, and the erection of well-proportioned public and private edifices, stand in proud attestation of a country's advancement. At the first settlement of the colony, the eye in every direction rested upon no other object than an interminable forest. Now, the stranger beholds Sydney, the metropolis of Australia, with no small surprise; the regularity of the streets, and the elegance of the buildings, being beyond his most sanguine expectations.

A proof of the country's progression consists in the appointment of the mails, and the quick and secure transmission of letters by post. Settlers in distant parts of the interior are now supplied with their letters and newspapers at a fixed rate, and at stated periods, and the inhabitants of Sydney with the latter twice every day, with the exception of Sunday. Stage-coaches also run regularly between the metropolis and some of the towns in the interior, while, for the accommodation of the good citizens of the capital, more than one hackney-coach has already started. Between the ports of Sydney and Newcastle several vessels are regularly trading, while others speed their way to Van Dieman's Land and New Zealand on varied objects of commerce. Nor are these the only means of intercourse by water. Two steam-vessels, those rapid vehicles of communication, which Great Britain and America shoot forth to different countries of the northern hemisphere, have begun to ply upon our southern waves. The Sophia Jane, and William the Fourth (the last built in the colony on William's River), make their weekly trips on different days from Sydney to Newcastle, a town on the mouth of the Hunter, and on to the Green Hills near Maitland, thirty-eight miles up the river. By this means the settlers in these rich and extensive districts have the accommodation of making choice of the opportunities, without regard to wind or tide, of proceeding to and from Sydney within a week, of shipping the produce of their farms for the market, and bringing back goods in return.

Another mark of the progress of cultivation and march of intellect, will be found to consist in the publication of newspapers and other periodical works; of the former, there are at present six in the colony, besides the *Government Gazette*; in addition to these we have the *Australian Almanack*, an annual which contains much useful information for the colonist.

A great improvement is daily taking place in the outward condition of the several ranks of society. While the climate is decidedly good, and where but little disease predominates, which, with care and attention, may be generally avoided or repelled, the sick, from accident or from causes unconnected with climate, the helpless and infirm, have the benefit of the Hospital, the Dispensary, and Benevolent Asylum. For the moral welfare of the community there are various societies. For the general reader, there are a subscription and two circulating libraries; for the scientific, lectures in natural philosophy, chemistry, &c.; and a museum, which must ere long rise into importance, as the public receptacle for the innumerable wonders of the animal, vegetable, and mineral kingdoms of this great southern land. Astronomy possesses her votary at the observatory in Paramatta, while the lovers of Flora may range at pleasure through the walks of the Botanical Garden and drives in the government domain in Sydney; and the admirers of agriculture and horticulture attend the annual meetings of 'the Society,' and witness the awarding of medals to the successful candidates for the several premiums for colonial produce and stock. The amateur of the 'course' can boast his turf, racing, and jockey clubs. The lover of drollery and fun, his 'Levy at Home;' the man of merchandise, his 'Australian Society,' his 'Chamber of Commerce,' and 'Marine Insurance Company.' And while the man of wealth rejoices in his shares in the larger, the prudent and thrifty avail themselves of a safe depository for their 'savings' in the lesser bank. Inventions of different kinds from the mother country are constantly multiplying.

As a consequence of this improvement in the physical circumstances of the people, population has within these few years been greatly on the increase; which will be evident from the fact, that by the census, taken in 1820, the number of souls amounted to 25,526, and by that of 1828, to 36,598. A great change for the better also has been gradually taking place in the quality of every description of stock. No country can be more favourable for breeding good horses than this. The mildness of the climate, the abundance of natural grasses, and the extensive runs through endless woods, and over the finest downs, tend in no slight degree to their improvement. We have at the present time most excellent breeds of different kinds, imported from England and India, both for saddle and draught, and their number far exceeds the demand for them. Here, too, they are subject to very few diseases, and live to a great age.

From the same advantages of climate and pasture, horned cattle also thrive well in this colony. Of the Devonshire, Suffolk, Durham, and Ayrshire breeds, very many have been imported. The supply of milk, butter, and cheese, is generally abundant. The beef is excellent and plentiful, and, consequently, cheap, and must continue so as long as the increase of animal food exceeds the consumption; many, however, of our superabundant cattle, will be drained from our herds, now that our salted beef, some of which, having been well tried, has been pronounced of very *superior* quality, is made to supply our whalers, and is becoming a valuable export from our shores.

As it regards sheep, our colonial wool has of late wonderfully improved, and is now equal or superior, in many flocks, to the fleece of any other country. Good, confidential shepherds, however, are much wanted. Were the sheep farms supplied with such, the quantity of wool would be greatly increased, as the lives of many valuable sheep would be annually saved to the wool-grower.

Many thousand acres of our territory are now under cultivation in wheat and maize. On this side of the Blue Mountains the soil and climate are not generally favourable to the growth of the former, but are particularly adapted to that of the latter. To the westward of the mountains, and in the county of Argyle, wheat flourishes well, the crops are abundant, and the grain of the very best quality.

The cultivation of tobacco is rapidly increasing in the colony, and a very excellent snuff is manufactured in Sydney from its produce. The climate appears to be well adapted also to the growth of the hop, and of cotton and flax.

As regards vegetables, these of every description flourish in our gardens, while fruit-trees of all kinds, such as oranges, peaches, apples, pears, &c., are very productive amongst us. The olive promises well; and every year adds somewhat new to the present productions, in the shape of seeds and fruit-trees imported from Europe, South America, and India.

Considered in a mineralogical and geological point of view, this country is by no means deficient in interest, but, on the contrary, is daily advancing in importance. The quantity and quality of her coal, worked by the Australian Agricultural Company at Newcastle, will be not only a source of increasing value to the resident in Sydney, where the purchase of firewood, which must now be brought from a considerable distance into the capital, is attended with so much expense, but must also be an article of export. Some of the best kinds of iron are to be met with in the colony; and from the recent discovery, by the writer of this sketch, in the neighbourhood of the Liverpool Range, of native copper coating the rounded surfaces of agate and cornelian, it may be presumed that the riches of this mineral will one day be extracted from the bowels of our mountains, and be made to be of no trifling importance in the manufactures of the country. Here, in this new land, the geologist observes the general accordance of the inclination and alternation of the several strata with that of other countries on the surface of the earth, and discovers organic remains in localities similar to those where they are known to predominate in the old world.

Of the various descriptions of emigrants, the following are much wanted amongst us, and, if sober and industrious, may calculate upon obtaining full employment and good wages, namely, brickmakers and bricklayers, stone-masons and plasterers, ship and house-carpenters, coopers and wheelwrights, painters and glaziers, cabinetmakers and blacksmiths. And as the disproportion between the sexes cannot but be considered one of the most serious evils in the social condition of the colony, the emigration hither of unmarried females of good character, in the humbler walks of life (and many such have already arrived amongst us) must be attended with very beneficial results to the community at large.

Disappointments, however, many and grievous, having been experienced by settlers on their arrival, especially by the emigrant pensioners of the army and artillery, as a preventive against any similar misfortunes for the future, a society, which is called the 'Emigrant's Friend Society,' has been recently formed in Sydney, the especial object of which is, as vessels arrive successively in our harbour, to direct the strangers on our shores how to procure employment, and thereby prevent them from spending to no available purpose the little they possess, and from

being foiled in the hopes which induced them to quit their native land.

The permanent welfare of all classes in our community must doubtless depend upon a due proportion of emigrant capitalists and emigrant labourers respectively arriving amongst us. The system of making grants of land being now abolished, the former may purchase land of the government at the minimum price of 5s. per acre, or may rent land at a yearly lease of 3s. 1½d. per 100 acres; and as there are millions of acres in the colony still unoccupied, we invite to our shores individuals of this description, bidding them bear in mind the great advantages they will here enjoy in having on their farms the aid of convict labour, so much cheaper than that of free servants: assuring them, that if they will only take care that the servants assigned to them by the government be well treated, well fed and clothed, they will be as safe on their lands in the midst of the *bond*, as they would be in England, surrounded by the *free*.

Such then, we repeat it, is the present state of Australia; such her standing amongst the colonies of Great Britain; and, blest beneath the sway of a ruler whose study is the people's welfare, she cannot but continue to increase in wealth and importance, until at no distant period she shall obtain that great political boon from the mother country, a legislative assembly, and rise proudly pre-eminent, happy and independent, amidst the nations of the earth."

THE SEA.

Among the sublimer objects of nature, a prominent place is to be allowed to the sea—the deep and illimitable ocean, with all its various and opposite properties; its use, and its destructive power; its beauty in the summer sun, its rage and deformity in the winter storm; now bearing the fortunes of thousands on the favouring expanse of its bosom; now burying them in fury in its greedy depths. Then the daily flux and reflux of its tides, its mighty currents, its vast concavity, the infinite variety in shape and size of its inhabitants—all furnish materials for deep thought and pleasing speculation.

As is generally known, this vast expanse of waters covers by far the greater part of the surface of the earth; so that the land seems rather an exception from the sea than the sea from the land. In reality, however, the sea is a part of nature in every point of view subordinate to the land. The globe consists throughout of those substances which we generally denominate land, and the sea is nothing more than a covering to the more solid body, and one, comparatively speaking, of no great depth. The sea also is evidently designed as a subservient thing to the earth, furnishing the vapour which rears its vegetation, and the most easy means of transportation from one part to another.

The largest masses of the sea, uninterrupted by land, are, the Pacific Ocean, which separates the continents of Asia and America; the Atlantic Ocean, by which Europe and America are divided; and the Northern and Southern Oceans, which surround the poles. The extent of some of these oceans in one or more directions is not less than ten thousand miles. Besides lesser bodies of water, called seas, there are minuter subdivisions called gulfs, bays, and estuaries; but it our purpose, on this occasion, to confine ourselves to a general consideration of the properties and purposes of this interesting portion of nature.

The waters of the ocean contain, besides pure water, several extraneous substances, in proportions which vary in different parts: Muriatic or marine acid, vitriolic or sulphuric acid, fixed mineral alkali or salt, magnesian and sulphated lime, are the chief ingredients of sea-water. The saltness of the sea seems in general to be less towards the poles than under the equator: there are exceptions, however, in some places, particularly in gulfs which receive many rivers. Amongst the numerous experimental results which Dr Marcet has arrived at, relative to the different kinds of sea-water, are the following, viz.:—

"That the Southern Ocean contains more salt than the Northern, in the ratio of 1.02919 to 1.02757.

"That the sea in general contains more salt where it is deepest, and most remote from land; and that its saltness is always diminished in the vicinity of large masses of ice.

"That small inland seas, though communicating with the ocean, are much less salt than the open sea.

"That the Mediterranean contains rather larger quantities of salt than the ocean."

Sea-water, also, in several places, has been found less salt at the surface than at the bottom. In the Straits of Constantinople the proportion is as 72 to 62, and in the Mediterranean as 32 to 29. By acquiring additional saltness, also, it seems at a certain depth to lose much of its bitterness; so at least says Spurrman, who took up a bottle of sea-water from the depth of 60 fathoms, and found it to taste like fresh water, in which common salt had been dissolved.

Although it is easy to discover the advantages resulting from the saltness of the ocean, yet to solve the cause of its being so is a matter which presents the most serious difficulties, and has formed a subject for the most elaborate research of the philosopher, both in ancient and modern times, and, after all, the opinions entertained of it are as unsatisfactory as ever. Dr Halley has endeavoured to account for the saltness of the ocean, by ascribing it altogether to the soluble substances which are incessantly washed into it by the rivers, the waters of which, he observes, even in their greatest purity, are never without a certain portion of saline matter. The water in this state flows into the sea, and, being evaporated and dispersed over the atmosphere by aërial currents, it descends in rain or vapour upon the surface of this earth, and accumulates in its course to the ocean a fresh tribute of salt, which, not being a volatile substance like the fluid by which it is dissolved, is perpetually adding to the stock already deposited in the depths, and so keeps up the saline properties of the ocean. What may appear to give some weight to this hypothesis of Dr Halley, is the fact, that, from the whole surface of the ocean, there arise, in the shape of vapour, every twelve hours, no less than 30,320,500,000,000, or more than thirty millions of millions of cubic feet of water, which is more than sufficient to supply all the rivers which intersect the four quarters of the globe. Other naturalists observing that extensive beds of sea-salt occur in almost every part of the upper world, and concluding by analogy that the bottom of the ocean is similarly furnished, have concluded that the saltness of the sea is produced by the perpetual wasting of such beds, supporting by this conclusion the theory which implies a gradual increase of that property in the sea. Others, of more modern date, consider the waters of the sea as the residuum of a primitive fluid, which must have contained all the substances of which the globe is composed; and that this primitive fluid having deposited all the earthy principles, both acid and metallic, with which they were impregnated, there remained in their residuum (the present ocean) the elementary principles too intimately combined with water to escape from it; and with respect to the bitterness of sea-water, as it diminishes in proportion to its depths, it can arise solely from the great quantity of decomposed and putrifying animal and vegetable substances, which float in the ocean, and to which the rivers are constantly adding.

Whether the waters of the sea are not in a state of gradual diminution, is a question which has long engaged the attention of naturalists, and the result of every inquiry into this subject has been to prove that the present ocean, considered as to its entire quantity, remains always the same; but local circumstances, such as, for example, the clearing of waste lands, the destruction of forests, the turning away or choking up of the channels of rivers, may for a time alter the levels of some of the interior seas.

The quantity of water in the northern and southern hemispheres is exceedingly different. In the former, the proportion of land and water is seventy-two to a hundred; whereas, in the latter, it is only as fifteen to the same number. This unequal distribution of land and water in the two hemispheres, led the geographers and the naturalists of the last century to conclude, that a great continent existed in the south pole, to counterbalance the mass of land in the north. But the voyages of modern navigators have proved these conjectures to be altogether unfounded; indeed, according to the more rational views now entertained of the subject, the equilibrium of the globe can in no way be affected by the slight inequalities which are observed on its surface.

The knowledge which we have obtained of the depth of the ocean in various places, although sufficient for the purposes of the navigator, is too limited altogether to satisfy the inquiry of the curious. The greatest depth that has been reached by actual sounding has seldom much exceeded a mile. Lord Mulgrave heaved a very heavy sounding-lead in the Northern Ocean, and gave out with it a cable rope to the length of 730 fathoms, or 4680 feet (somewhat less than a mile), but without finding a bottom; and Captain Parry, with a line of 1020 fathoms, or 6120 feet (about a mile and an eighth), met with a similar disappointment. This was the greatest depth of soundings that is known to have ever been attempted. The depth of the sea has been thought to correspond with the height of the mountains upon its shores; but the justice of this theory, of course, can never be properly ascertained. Along the eastern coast of America, the average depth of the ocean, at the distance of 100 leagues from the land, appears to be about 300 and 360 feet; but the theory of the tides seems to require that the mean depth of the Atlantic should be about three miles—in no instance is there reason to conclude that the greatest depth of the ocean exceeds four miles.

So far as the bottom of the sea has been explored, it is found to be of as unequal surface as the land; so that, if the fluid were dried up, we might expect it to assume the appearance of hills and vallies, table-lands and large plains. In some places, the bed of the sea is found to be covered with vast quantities of shells, intermixed with sand and gravel; and in others, with soft alluvial sand several feet in depth. Donati, the Italian naturalist, describes the beds of shells at the bottom of the Adriatic Sea to be several hundred feet in thickness; and a great part of the bottom of the South Sea is known to be covered with coral rocks, which, though the production of very small insects, frequently rise, like stupendous walls, to the surface, and form extensive islands. In Cook's Voyage to the Pacific, one of these submarine formations is described as follows:—"At one part of the reef, which bounds the lake within, almost even with the surface, there was a large bed of coral, which afforded a most enchanting prospect. Its base, which was fixed to the shore, extended so far that it could not be seen, so that it appeared to be suspended on the water. The sea was then unruffled, and the refulgence of the sun exposed the various sorts in the most beautiful order; some parts luxuriantly branching into the water, others appearing in vast variety of figures, and the whole greatly heightened by spangles of the richest colours, glowing from a number of large clams interspersed in every part. Even this delightful scene was greatly improved by the multitude of fishes that gently glided along, seemingly with the most perfect security. Their colours were the most beautiful that can be imagined—blue, yellow, black, red, &c.—far excelling any thing that can be produced by art."

The celebrated diver Pesacola, whom the Emperor Francis the Second employed to descend into the Strait of Messina, saw there, with horror, enormous *polypi* attached to the rocks, the arms of which being several yards long, were more than sufficient to strangle a man. There are also bituminous springs, and even springs of fresh water, that spout up from the depths of the ocean; and, in the Gulf of Spezzia, a great sprout or fountain of fresh water is seen to rise like a liquid hill. Similar springs are to be found in the Bay of Xagua, which gush up with such force that small boats dare not approach them.

Several of the subordinate seas, or branches of the great ocean, have been distinguished by names agreeable to the peculiar colour which they possess, such as the Red Sea, the Yellow Sea, the Black Sea, the White Sea, &c. This difference of colour is ascribed to accidental circumstances, such as the nature of the bottom, the infusion of certain earthy or mineral substances, &c. In some instances the colour is permanent, and in others it is only illusory, produced by the fugitive tints of the sky. Humboldt informs us that he has frequently observed the waters of the Atlantic, when no change could be perceived in the appearance of the sky, to pass suddenly from an indigo blue to a deep green, and from the latter to a grey appearance. The Greenland seas, also, have been observed to change from ultra-marine blue to an olive green, and from perfect transparency to the semblance of a thick and muddy pulp. This phenomenon is ascribed to a vast quantity of animalculæ in the green-coloured water; for in the blue, where few of these insects are to be found, the sea is so transparent that the bottom may be seen at the depth of eighty fathoms.

HONEY BEES AND WILD BEES.

Besides the common bee, which is fostered in gardens, &c. on account of its honey, there are several others in this country which also produce honey, and whose nests often afford a prize of well-filled combs to schoolboys and little shepherds, when discovered in hedge-banks or the sides of hills. It is often a question with such young philosophers, why the creatures which afford them such a rich treat, and whose underground stories seem as copiously filled as those of the most industrious hive, are not domesticated as the latter are, and indulged with a place in the garden, where they might labour to the same useful purpose as their brethren. This appears the more singular, that they are seen humming about on every flower during the honey months, and may be supposed to carry off much of the sweets that might otherwise be brought to the garden hive. They are of several different kinds, all apparently equally industrious. There is the common *humble bee*, black, with the hinder part of its abdomen white; the *black and red bee*; the *brown* or *foggy bee*, somewhat resembling the *carder* in its habits; and the *black bee*, noted for the fierce defence of its nest, which, after all, is not much worth plundering. These are the chief kinds which produce honey; and the question, as we have said, is, why are they not domesticated in hives, and their labours made useful like those of the garden bee? In answer, we may mention, that, in the habits of all these bees, there are circumstances which render their domestication almost impossible. The course of their life through the summer is as follows:—One bee alone having survived the rigours of winter, generally sets to work, about the early part of June, to construct a nest for herself and her future progeny: these nests are of different kinds, according to the habits of the insect; some of them, as the humble bee, going deep into the earth in dry banks; others preferring heaps of stone or gravel; and the brown, foggy, or moss bee, choosing always some bed of dry moss, generally of the long interwoven kinds called *hypnum*. The nest, as first constructed, is of small dimensions within; but when the bee has deposited her eggs, and young begin to be hatched, they all labour in common, and soon produce much more ample accommodations. The cells which we find in these nests are not the work of the old bee, but are formed by the young insects in

the same manner as the cocoons of silk-worms; and when the perfect insect is released from them by the old bee, which the latter does by gnawing off their tops, they are then employed as honey-cups. The honey which is here deposited is not, however, intended as a store for winter: it is collected solely to meet the wants of the growing colony in rearing its young bees, which are fed on a mixed food of honey and pollen (dust from the flowers of plants) while they are in the caterpillar state. The wants of the young go on increasing for a great part of the summer, and the quantity of honey they consume is very large: towards the middle or latter part of September, however, the energies of the bees begin to wax fainter, and little further progress is made in adding to the colony, or in collecting honey. Cold and showery days begin, even by this time, to thin the number of the insect population, who are now seen creeping slowly, with damp and heavy wings, upon the stalks and petals of flowers, where they were formerly seen actively buzzing about in search of honey. The stores of the honey-cups have not outlasted the wants of the young unfledged bees, of which they were the proper food; and if the nests be examined now, these cups are found quite empty. The bees which survive the accidents of rain, cold, and frost (for they are now frequently overtaken by frosty nights in their languid journey homeward), by degrees forsake the nest and its furniture, leaving the latter as a prey to mice, beetles, or other animals. To shelter themselves for the winter, they seek out some dry bank (not preferring one exposed to the sun), where they penetrate to the depth of eighteen inches or two feet into the earth, pushing up the earth behind them, and leaving no visible track by which they have descended. In these situations they are often found by labourers and others in digging the earth; and such people are often greatly puzzled to imagine how the insect can have reached such a depth. Persons who have attended to the habits of wild bees, can often fix on the spots where they take refuge, digging for and finding them with the greatest certainty.

The experiment of domesticating the different kinds of wild bees, has been tried; and it was found, that by removing their nest cautiously in an evening, and placing it in a quiet situation, in a garden or other place where they could be observed, they went on with their works without apparent alarm or interruption. During the whole summer, they continued to prosecute their occupations with the same industry as other bees; but about September, as we have mentioned, the hive began to turn languid, and the numbers which appeared going and coming about the entrance became daily smaller. It was imagined they had taken refuge within the hive; but when this was opened, after all seemed to have ceased their labours, every thing was found empty and deserted; there were neither bees nor honey; the stronger and younger insects, no doubt, having gone to make burrows for themselves in the earth, and the older ones having gradually fallen victims to the accidents of approaching winter.

The habits of our common honey bee are quite the reverse of these: the honey which they collect is intended partly as a store for use during some future emergency; and, accordingly, the quantity remaining at the end of summer, though some portion has been wanted for the nourishment of the young bees, is always large, and affords an ample repayment to those who have furnished them with shelter. This bee appears to have been originally a native of warmer climates than that of Britain; but it has been carried in the train of civilised man to whatever wilderness he has gone to colonise. It is now naturalised in New Holland, and in America it always keeps advancing into the solitudes of the forest, some hundred miles before the regular settlements of civilised people; the Indians mark its approaches, and call it the "*white man's bee*," because they find it the constant forerunner and companion of the white settlers.

In Cashmere there are several kinds of bees, *which have the habits requisite for domestication*; and that country, with the north of India, appears to be the native soil of these genera of honey bees. The inhabitants have a way of domesticating them which might be imitated with success in this country. In building dwelling houses, they leave certain cavities in the wall, with a very small aperture to the outside, like the entrance to a hive, but quite open inwards; this inner part is covered afterwards with a frame, having a door which opens at pleasure; into these cavities, which are much superior in the essential respects of warmth and security to our bee-hives, the insects are admitted; and here they carry on their labours during the summer. The people of the house, by opening the interior door, can see them at work whenever they please, and can remove a honey-comb at any time without distressing the hive; the only precaution necessary being to blow in at the back part as much smoke as will make the bees fly out at the front entrance. English travellers have seen the operation performed, and the bees quietly return. This plan of lodging bees might be followed here to great advantage, if not in dwelling houses, at least in the offices about farms, where a bee-hive in the wall would be at once cheaper, more secure, and more ornamental, than the masses of straw now used, which, besides affording no security against human plunderers, are the continual haunt of mice, snails, and all sorts of vermin.

THE ESKDALE POET.

In the second number of the Journal, we presented a poem, entitled an *Ode to Poverty*, the production of William Park, a person in a humble walk of life in the district of Eskdale, upon the Scottish border. This ingenious individual, who belongs to that class of the peasantry from which Burns, and so many other Scotsmen who have distinguished themselves, drew their origin, has now published a volume of his collected poems, descriptive of his native vale, his feelings under various circumstances, and the objects which struck his fancy in the course of his rural occupations. Some of these pieces possess considerable merit, and, to be the effusions of a humble peasant in a remote thinly-populated district, who must have drawn his knowledge of mankind and their refinements almost entirely from books, tney are so very creditable to him, that we most earnestly recommend them to the notice of our readers. The following verses, addressed to a human tooth, dug out of the cairn on Airswood-Moss, in May 1828, may be accepted as a specimen of the livelier pieces, as well as of the capacity of a plain Scottish ploughman of the nineteenth century:—

TOOTH OF THE OLDEN TIME.

Tooth of the olden time! I'd wish to learn
Thy living history; what age and nation
Thou represented'st underneath the cairn,
Fruitful of antiquarian speculation;
Nor are my queries an unmeaning sally—
Tooth is to tongue a neighbour and an ally.

Was it thy proud distinction, ancient tooth,
To ornament and arm a Roman jaw,
When the all-conquering legions of the south
Impos'd on us their language and their law?
When death or bondage seem'd to overtake us,
Pray, didst thou gnash defiance on Galgacus?

Was thy proprietor a sky-blue Pict,
Remarkable for longitude of arm?
One of that tribe which kingly Kenneth kick'd
From crown and kingdom, to their no small harm?
Well known they were, I wot, for uncouth grammar,
For painting, too, and throwing the sledge-hammer.

Perhaps thou art a tooth of Saxon breed,
(A heath'nish cruel race with yellow hair,)
And haply grinn'd within some helmed head,
With every transport, when the victim fair
Was seiz'd and slain, and sacrificed, and sodden,
And served up to bloody Thor and Woden.

Thou'rt not Druidical, I'm prone to think,
For near my lonely tomb no forests grow;
Nor o'er thy bending river's grassy brink,
Hath the green oak its shade been known to throw,
Forming a fane of gloom for Druid sages,
Or all hath perish'd in the lapse of ages.

What was thy owner, then?—a warrior dire,
Who liv'd and died amid the din of battle?
Was he some consequential feudal squire,
Who bought and sold his serfs like other cattle?
Mayhap a bard, with soul of gentler quality,
Who sigh'd for, but obtain'd not, immortality.

If so, what funeral rites appeas'd his shade?
Wak'd minstrelsy her wildest intonations?
Did silent sorrow many a breast pervade?
Or rung the welkin wide with ululations,
While rose in air the monumental stones,
A graceful cone—most venerable—of bones?

Ah! little thought the magnet of his times—
Th' aspiring bard—the man of power—the hero—
That his renown should rise in these my rhymes
After ten centuries' repose at zero;
And that his tooth, ejected from its socket,
Should toss and tumble in my waistcoat pocket.

Having discuss'd these high concerns a little
(I hope with some decorum and propriety),
There yet remain some minor points to settle,
Though not less interesting to society;
Questions connected with domestic quiet
And happiness—I now allude to diet.

Much as I've sought thy lineage and descent,
Thou bony remnant of departed glory!
I own I'm not less anxiously bent
To learn thy private, more immediate story—
What meats, or common, or, by way of cordial,
Have undergone thy masticating ordeal.

'Twere an uncourteous question, "Didst thou fare
On luxuries which modern teeth disable?"
Thy hardy frame and healthful looks declare
That no such trash e'er trifled on thy table:
Thine was the food of undegenerate ages,
Else never hadst thou figured in my pages.

'Twas thine, heroic tooth! 'twas thine to pierce
The red deer's swelling sides with pride dilated;
The wild boar's head, terrific, grim, and fierce,
Thy eager, ardent onset too awaited;
Then teeth with tusk in deadly conflict meeting,
Display'd the feats of true primeval eating.

'Twere equally uncivil to inquire
If aught thou knowest of the frightful *ache;*
Thy fangs are sound as one could well desire,
Thy hard enamel smooth as frozen lake.
Thy triumph is twofold, O tooth sublime!
Thou scorn'st alike toothache and tooth of time.

And here thou art, a prodigy—a wonder—
A monument of undecaying earth;
Nor more of thee we'll know till the last thunder
Shall from his slumbers call thy master forth;
These puzzles which I grapple with in vain
Shall then be solv'd—and all thy case seem plain.

USE OF WOAD.

The blue colour in cloth is produced by using indigo and woad. Indigo is a drug procured from a plant grown extensively in Hindostan, and is an important object in commerce. About 30,000 chests of it are imported annually into Great Britain. The use of this drug has greatly superseded woad as a dye-stuff, still the latter is also in considerable requisition, and though not yielding so deep a blue as indigo, it gives one fully more durable. Woad is a powder procured from the liquid expression of a plant of the same name. It is grown in France, and in a few parts of England, Lincolnshire, we believe; but it is little known by cultivators in Scotland. As there is scarcely any article in commerce which can be so easily adulterated without detection as woad, and as the success of the dyer very much depends on the genuineness of the material, it is to be hoped that Scottish dyers will soon see the propriety of entering upon its cultivation, which may be easily done. It may be mentioned that Thomas Turnbull was the first person in Scotland who succeeded in dying blue from woad. He was a native of Hawick, and for a considerable time carried on business as a dyer and waulker in Eskdale-Muir, and latterly conducted the dyeing department in Innerleithen cloth factory. He died in 1803, and in gratitude for the benefits derived from his skill, the dyers of Galashiels and Innerleithen erected a monument over his grave in the churchyard of the latter place.

ELEGANCE BY ACCIDENT.

The following curious anecdote is told of Lady Wallace, famed, in her maiden days, as Miss Eglintoune Maxwell of Monteith, and the sister of the Duchess of Gordon. The young lady's family was about to attend the races at Leith, and the coach was just at the stair-foot, ready to take them away, when it was discovered that Miss Eglintoune was not ready, on account of wanting her head-dress, which she was expecting the milliner to appear with every moment. It so happened, that as the milliner was coming along the street with the dress in her hand, she permitted some part of it to catch the knee-buckle of a street porter, by which it was torn, and, as she thought, completely spoilt. However, she took it to Miss Eglintoune, and told her the story, with many protestations of regret. The volatile young lady took the dress from her hands, and, running to her glass, proceeded to put it on, torn as it was, only arranging it upon her head in such a way as to conceal the misfortune. She then joined her friends in the carriage, and at Leith, attracting, as usual, much attention, the ladies, instead of ridiculing the awkward appearance of her cap, admired it exceedingly, and came back to Edinburgh, full cry, in the afternoon, to get caps of the same description. Of course it was soon known that it was the manufacture of the milliner, who forthwith was completely overwhelmed with orders for similar caps, and, we believe, was obliged to tear them with a nail in her counter, in order to complete their resemblance to the original.

DR ADAM SMITH.

This distinguished philosopher was remarkable for absence of mind, for simplicity of character, and for muttering to himself as he walked along the streets. As an anecdote of the first peculiarity, it is related of him, that, having one Sunday morning walked into his garden at Kirkaldy, dressed in little besides than his nightgown, he gradually fell into a reverie, from which he did not awaken till he found himself in the streets of Dunfermline, a town at least twelve miles off. He had, in reality, trudged along the king's highway all that distance, in the *pursuit* of a certain train of ideas; and he was only eventually stopped in his progress by the bells of Dunfermline, which happened at the time to be ringing the people to church. His appearance, in a crowded street, on a Scotch Sunday morning, without clothes, is left to the imagination of the reader.—It is told, as an example of the second peculiarity, that, on the evenings of those very days which he had devoted to the composition of the *Wealth of Nations*, he would sometimes walk backwards and forwards through his parlour, waiting for an opportunity when he might abstract a lump of sugar from the tea-table, unobserved by his housekeeper, who exercised a kind of control over him.—It used to be related of him, that one day, as he was muttering very violently to himself, in passing along the streets of Edinburgh, he passed close to a couple of fish-women, who were sitting at their stalls. At once putting him down for a madman at large, one remarked to the other, in a pathetic tone, "Hech! and he's weel put on too;" that is, well dressed; the idea of his being a gentleman having, of course, much increased her sympathy.

LONDON: Published, with Permission of the Proprietors, by ORR & SMITH, Paternoster Row; G. BERGER, Holywell Street, Strand; BANCKS & Co., Manchester; WRIGHTSON & WEBB, Birmingham; WILLMER & SMITH, Liverpool; W. C. SOMERSCALE, Leeds; C. N. WRIGHT, Nottingham; WESTLEY & Co. Bristol; S. SIMMS, Bath; J. JOHNSON, Cambridge; W. GAIN, Exeter; J. PURDON, Hull; G. RIDGE, Sheffield; H. BELLERBY, York; J. TAYLOR, Brighton; and sold by all Booksellers, Newsmen, &c. in town and country.—CHAMBERS'S HISTORICAL NEWSPAPER, a Supplement to the present publication, is published on the first of every month; and CHAMBERS'S INFORMATION FOR THE PEOPLE, of which every number is a distinct subject of human knowledge, appears once every fortnight.

CHAMBERS'S EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF "CHAMBERS'S HISTORICAL NEWSPAPER," AND "INFORMATION FOR THE PEOPLE."

No. 96. SATURDAY, NOVEMBER 30, 1833. PRICE THREE HALFPENCE.

RESPECTABLE AND NOT RESPECTABLE.

ALL the virtues, all the decencies, all the merits, are now included in Great Britain in one word, and that is—*respectable*. We never ask how a man behaves, and hardly concern ourselves about his possession or non-possession of brilliant, amiable, or useful qualities; we ask if he is *respectable*, and if we receive a decided answer, are content. Respectable means different things in different places, and with different men. A witness on Thurtell's trial described Weare as a respectable man—he kept a gig. It may be ruled on some other occasion that there is no respectability under a chaise and pair; and, on the other hand, there may be some conditions of society, in which this summum bonum is supposed to reside in a four-wheeled vehicle with a leathern hood. There is no speaking precisely on this point. Very generally, we understand, along the southern shores of England, respectability takes two forms—a gig and a pleasure-wherry. You may make your election; but one of them you *must* have, or you are not respectable. Different standards are kept at different places; and if you considered yourself respectable by York measure, you might perhaps find yourself greatly short by that of Winchester.

The idea is so far arbitrary; but we may pretty safely assume, as a general rule, that the respectable people are those who have the means of living in the best style within a certain range of territory. Among the Laplanders, for any thing we know, the possession of a pair of spare snow-shoes may constitute respectability. Wealth is always more or less at the bottom of it. A man may, under very peculiar circumstances, be wealthy without being respectable; but he cannot, under any circumstances, be respectable without being wealthy. He must be placed above all mean temptations, all paltry appearances, all risk of cracking credit with the world, and troubling his acquaintances in a short time with the necessity of recognising a wretch upon the street. He must be a man who goes to church regularly with his wife and a silk umbrella. Religious he may be or not, at heart, so far as this way of estimating mankind is concerned; but the world is clear that the umbrella must not be cotton.

To wear black clothes is respectable. The admixture of coloured garments is perhaps very well, but "not just so respectable." A black hat is respectable; no kind of covering can be more so. But a white hat is liable to great suspicions: it may be buckish, gay, light, and so on, but—*not respectable*. To go to the pit of the theatre is respectable in a kind of way: to go to any species of gallery is not respectable: to go to any part of the house on a benefit night, is far from being respectable, unless in the case of an actor in whose acquaintance it may be supposed there is some eclát. For gentlemen to wear brooches or rings, is not respectable; such trinkets being in great requisition by quack doctors, jugglers, and other flashy characters, who require to make an impression at first sight and away. A ring is only respectable in the case of a gentleman, when it is a cameo worn on the little finger of the right hand; this shows that the wearer does not require to work, and to be able to live without working is exceedingly respectable. To walk across a street diagonally is not respectable: it shows you wish to save time, and that proves that you are not a gentleman at your leisure: you must always walk quite to the end of the street, and take the regular crossing. To walk the streets of the west end of London, with both gloves on one's hands, is not respectable: true respectability consists in having the right hand exposed, so as to prove by its whiteness, and its ring on the little finger, that it is not liable to mechanical exertion. At church-going time it is highly respectable to mingle with a crowd proceeding towards any particular place; but to be seen going against the stream, especially in the direction of the suburbs, is not respectable. To ride on horseback is respectable, provided the animal be well made and look as if it cost five-and-thirty guineas; yet to ride upon a cream-coloured horse, however valuable it may be, is not respectable; for nobody but showmen and such like people keep horses of that colour. To wear burnt steel spectacles is respectable, and to carry a gold watch is also respectable: we need not say what it is to be seen with a silver or pinchbeck one. It is decidedly more respectable to carry the watch in the fob than in the waistcoat pocket.

Among women, the last winter's fashion is not respectable, neither is any piece of dress respectable which has become common among servants or the poorer classes. The knack of keeping to respectability in dress is to leave off a peculiar garment or ornament the moment it finds its way among those of an inferior station. In this way, the higher classes are continually leaving the middle and lower ranks in the lurch. A rent in one's clothes, being referable to accident, may not be disrespectable; but, as Selwyn remarked, a darn is premeditated poverty. Nankeens in cold weather are not respectable. With regard to articles of domestic use, a sideboard in a dining-room is thought respectable; a Brussels carpet, a haircloth sofa, sufficiently voluminous window curtains, a marble lobby table, silver candlesticks, and silver forks, are all respectable. In matters of eating and drinking, roast beef is one of the most respectable dinner dishes, and is likely to maintain its respectability in the face of all improvements in cookery. Port was once a respectable and may be still a good wine, but it is respectable no longer, because every body can now get port. Claret is at present one of the most respectable wines that can be drunk, though it depends in a great measure upon the Chancellor of his Majesty's Exchequer how long its respectability may last.

Whatever bears the impress of a constitutional or legal establishment, is respectable. It is no matter that the thing is not generally admired; so that it is part of the system of public things that *exists*, it is sure to receive this approving epithet. The church-rates are said to be unpopular in England; yet it is nevertheless highly respectable both to levy and to pay them. The civic corporations every where are alleged to have been most shamefully mismanaged; but, whether such have been the case or not, nobody ever hinted that any individual member of them was otherwise than respectable. There may be as much fraud, baseness, and even criminality, in any part of the state-system, as the most uncompromising Jacobin chooses to ascribe to it; yet the whole community look upon the administering or profiting persons as highly respectable. Rebellion is not respectable: Charles Stuart, in 1745, was a very gallant fellow, and so were all the chiefs and gentlemen who accompanied him; but they were not respectable. Cumberland was more so, even in the midst of his butcheries. When rebellion is successful, the persons concerned in it become exceedingly respectable; but still the abstract idea of rebellion remains as little so as ever. Cicero was very severe upon Verres; we seriously believe, however, that in his secret heart the orator considered the robber of the Sicilian province as a most respectable person. If we apply this new way of judging men to some other historical characters, how curious is the result! Tarquinius, it is evident, was a far more respectable person than Brutus, up to the hour of his dethronement. Coriolanus, we all know,

> — was a kind of nothing, titleless,
> Till he had forged himself a name i' the fire
> Of burning Rome.

After that prank, he was highly respectable. Pompey in power was respectable; but he gets shockingly disrespectable about the time of the battle of Pharsalia. Sir William Wallace was the saviour of his country. He is now revered immensely by every body but Dr Lingard. King Edward, however, and all the nobles of both countries, and many other people besides, must have thought him by no means a respectable man. Even as a squire in the service of the tyrant and destroyer, he would have been more respectable than as the leader of the patriot army which "rescuit Scotland thrise." Luther was at first a shockingly disrespectable man. Leo the Tenth only smiled at the nonsense of Brother Martin. It is evident he did not become at all respectable till the signing of the confession of Augsburg. It was not respectable to be concerned in pulling down of monasteries at the Reformation; but it is now quite respectable to take advantage of that outbreak of the lower orders. Cromwell, in our opinion, never was a respectable man. He was only a fortunate brewer. His talents, his courage, we will even say his patriotism, were nothing, so far as respectability was concerned. If he had contrived, however, to establish a dynasty, his great-grandson, without either talents, courage, patriotism, or any virtue under the sun, would have been respectable. Notwithstanding all the faults of James the Second, no one would ever say that he was not a respectable man. The Prince of Orange, on the other hand, was not respectable at Exeter, but highly so in Whitehall, and rather more so after his father-in-law had stolen off to France, than before. Washington, who, even in Britain, is now estimated as one of the greatest of men, was not so much as respectable till about the year 1780. "A forward impudent fellow of a land-surveyor, sir—just wants to put himself forward." There might be some, we do not doubt, who would allow him a little respectability after the rendition at Charleston; others would wait till George the Third received the American ambassador. At the same time, Lord North continued quite respectable till he resigned office. As for Napoleon, he comes under the same category as Cromwell. We pass on to Charles the Tenth, who continued quite respectable throughout the three days of Paris, and only on the fourth became the reverse. Whether it was imprudence, or misfortune, or wickedness, that brought about his dethronement, all the bloodshed, though it had been ten times greater, would never have detracted from his respectability, if he had not at last been obliged to abdicate. It was conceded by the good-natured man to whom Nero's atrocities were related, that he must have been a wag; but even this would have been censure too great in the tyrant's own life-time. In the midst of the very flames of Rome, the possessor of so much power must have been a respectable man. In fact, the most atrocious tyrant, the vilest local oppressor, the most denounced enjoyer of pension, sinecure, and bribe, will always be, by the constitution of things, more respectable than the loftiest minded patriot who endeavours, and has not yet succeeded, in establishing a different system.

To invent any thing is perhaps very ingenious, but it is not respectable. The very projector of the steam-engine, which has doubled the wealth of his country, was not respectable, we are persuaded, in his capacity of a mathematical instrument-maker (unless perhaps his being mathematical instrument-maker to the *University of Glasgow* made him so), nor till he

had begun to make a little money by his patent, and was taken by the hand by rich Mr Bolton. The most thick-headed of tradesmen, who spends his whole life in an employment for which almost any person is fit, is far more respectable than he who, by some power of reflection, provides the means of existence for thousands of additional human beings. All the world knows how disrespectable it is to be even a pretty good poet. Burns was a capital one: monuments, costing three thousand pounds each, are now built to him. Yet Burns never was a *respectable* man. The binder of his books was probably more so. There must have been many worthy people in his own time, who would have far rather marched through Coventry with the one than the other. Youth is another thing that is not respectable. It is the time for joyous vivid feeling, for frolic, for love, for hope, for enjoyment in short; but it is not respectable. There is no saying how young men are to turn out. The half of them have to be smuggled off to the West Indies and Van Dieman's Land, after doing all kinds of mischief at home. The dawn of respectability commences about thirty, by which time their powers of self-denial and activity are generally pretty well proved. Always the older, however, the more respectable. Jackson, in Roderick Random, was well aware of this. He put on a wig and false eyebrows, and other insignia of middle life, when about to pass muster before the College of Surgeons; and, though detected and hustled out, the idea was not the worse for that. Walpole knew this too, when he turned Chatham into ridicule on account of his youth. The aged trafficker in consciences was ten thousand times more respectable than the ardent young patriot—who, however, became respectable enough himself before the end of the day. Of all young things in the world, a young periodical work is the most disrespectable. It knows the fact, and tries to hide it under splutter and pretension; but though it may say the cleverest things, and contain the most splendid papers, and prove incontestibly that the exact thing wanted by the public was never hit upon till now, an old number of the Gentleman's Magazine or the Glasgow Herald carries ten times more weight by saying nothing at all. We verily believe that there are some works, newspapers among the rest, which would be better received, though consisting of nothing but blank paper, than others in which the greatest talent and industry are employed, but which, being recently put into existence, are—not respectable.

There is another way of viewing the word respectable—when it is used in reference to conduct. The kind of behaviour called respectable is confined to no rank or degree of wealth. The conduct of very poor men is often described by the most exalted as respectable. For the word in this sense, no other feeling than veneration can be entertained; because nothing can be more evident than that *respectable behaviour*, as it is called, even in a few out of a large society, conduces immensely to keep the vicious in check, and to encourage those who are disposed to be good. Indeed, but for the quiet respectable people of all ranks, the world would be as bad as ever it was, and never get any better. Considered, however, as a measure of wealth, and the consequence which wealth imparts, the word is as fairly entitled to contempt, as any of those shibboleths, which, in a higher sphere of society, are used for the exclusion of the non-illustrious. The middle ranks are found to be dreadfully galled by the exclusiveness of the higher; but they should first consider if they are less exclusive themselves. We rather suspect that the general use into which this word has come, progressively with the rise of the middle ranks, shows that there is, in them, as much relative jealousy of station, as among their superiors. The peeress talks of the narrow circle at Almack's; and the wife of the comfortable tradesman speaks of *respectable people*, meaning not virtuous or good people, but a set who are above a certain degree of income: both act naturally, perhaps, but neither of them is animated by feelings which an unconcerned person can conscientiously respect.

THE LAND OF BUCHANAN.

George Buchanan—perhaps the most extensively known native of Scotland next to Sir Walter Scott, and the most elegant writer of Latin since the fall of the Roman empire—was born in a sequestered part of the county of Stirling, in the month of February 1506. We lately made a pilgrimage of literary devotion to the place, and picked up some information, and made a few observations, which we believe may entertain our readers.

The scene of Buchanan's birth and early years is a small farm in a confined valley, situated a few miles to the eastward of Lochlomond, so celebrated for its picturesque beauties, and about fifteen miles to the north-west of Glasgow. The valley is watered by a rill called the Blane, which, after joining one called the Endrick, falls into Lochlomond; and the scenery is a mixture of highland and lowland, being situated, in fact, between these two districts, or where the one melts into and joins the other. There is an interest in surveying the outline of the country, from the place where a man of genius has been ushered into existence; for in seeing what *he* must have frequently seen, one is in some measure brought into contact with him. It is agreeable to think that the eye of Buchanan, on opening to the world, must have surveyed a scene of very considerable beauty, and fitted to inspire his mind with poetical sentiments. On one hand rises the range of hills which bounds the view to the north of Glasgow, and are generally called the Campsie Fells; on the other, a range of meaner but equally untamed eminences. In another direction, the alpine grandeur of the West Highlands stretches away into the blue distance. There is a hill in the neighbourhood, from the top of which, on a clear day, may be seen the seas at both sides of the island; the view extending from North Berwick-Law and the mouth of the Firth of Forth, to Ailsa and Arran, the latter of which must be at least a hundred and twenty miles from the former. All along that side of the Campsie range which is turned towards the vale of Blane, little streams descend at various intervals, forming the most beautiful cascades, and each hollowing out to itself a little nook or glen where poets or fairies might alike love to dwell. On the top of one of the hills on the other side, there is a very extraordinary natural curiosity, in the shape of a deep narrow chasm, which cuts through the whole back of the hill, like a gash in the edge of a cheese, and is called the Wangie. The most conspicuous eminence in the immediate neighbourhood is one called Dungoin or Dungun, that is, the *great windy hill*, which shoots up in a rugged and threatening fashion, like the head of a proud animal tossed into the air: opposite to this, on the other side of the vale, is Dungoyack (*the little windy hill*), which is remarkably isolated and conical, and wooded to the top. The two eminences, standing as they do like watchmen at the entry to the vale, might be likened by a classical imagination to the Pillars of Hercules. Such are the objects with which Buchanan must have been familiar in those early days, when impressions are the most vividly formed, and most permanently retained.

The farm on which the poet was born is called Mid-Leowen, or more commonly the Moss, the latter title being derived from a morass near the house. His father, Thomas Buchanan, who farmed this ground, was the second son of the Laird of Drumakill, whose family in the main line continued till lately to exist as a race of minor gentry. Owing to the bankruptcy of the grandfather, and the father's early death, the burden of rearing a family of eight children fell upon the mother, whose name was Agnes Heriot, of the family of Trabrown, in East Lothian—a race which produced the celebrated George Heriot, and the mother of another man of distinguished ability, Thomas, first Earl of Haddington. This active and intelligent woman is said to have performed her task in a highly creditable manner. George was first put to the parish school, at the village of Killearn (about a mile distant), where he is said to have manifested an uncommon aptitude in receiving instruction. In the language of the country people, who preserve a traditionary recollection of the circumstance, "he sucked in lair * as the laif † sucks in milk." We are informed, however, by himself, that his knowledge of Latin was the result of much youthful labour. His difficulties would probably be increased by the necessity of learning English before acquiring this classical language. That Gaelic was the current speech of his native district, there is little reason to doubt, since, even in the middle of the last century, the immediate neighbourhood of Killearn was subject to Highland rule and Highland usages, and since it is an ascertained fact that he retained an acquaintance with this language in middle life. "When in France, having met with a woman who was said to be possessed with the devil, and who professed to speak all languages, he accosted her in Erse, and, as neither she nor her familiar returned any answer, he took a protest that the devil was ignorant of that tongue."‡ By Dr Mackenzie, Buchanan is said to have been subsequently sent to complete his classical course at the school of Dumbarton; but, as that writer required no better authority for any statement than mere conjecture, we are to consider this as at least uncertain. It is certain, however, that he studied at the college of St Andrews, and subsequently, by the aid of a maternal uncle, at the university of Paris. After a series of dreadful hardships and difficulties, he completed his education; and so rapid was his advancement in life, that, at the age of twenty-three, he was professor in the college of St Barbe.

* Learning. † Loaf.

‡ Memoir of Buchanan, in the seventh edition of the Encyclopædia Britannica; an article which would do honour to a work where honour was less required.

The natal house of Buchanan does not now exist. It was destroyed in 1808, to make way for a new and more elegant mansion, which occupies exactly the same site. The original house was a long cottage of one story, having a kitchen in the middle, and a room at each end, some minor spaces serving as bedrooms and closets. The door, from the west, entered the kitchen by a kind of vestibule, termed "the hallan," and from the kitchen there was an entrance, on the one hand, to a bedroom lighted by a very small window, and, on the other, to the principal apartment or "spence," in which, according to tradition, the historian was born. From the end of the house opposite to this "spence," proceeded a range of meaner buildings, comprising in succession a stable, a stirk-house, and a peat-house, from which proceeded at a right angle, another range, comprehending a milk-house, a barn, and a byre or cow-house. It was believed, that, with some trifling exceptions, the whole suit of buildings was the same as when occupied by the mother of Buchanan. It continued till the date mentioned to be used, not as a farm-house, but as the residence of a considerable proprietor, Mr William Finlay, whose descendant now occupies the enlarged house. The place, however, bore all the appearance of a common Scottish farm-steading of the old style: the hearth in the kitchen was formed, for instance, of a disused mill-stone. The tradition as to its great age gained support from the immense oaken beams which upheld the roof, and which seemed as if they could have lasted twice the time that has elapsed since Buchanan's birth. From these large rafters were formed a plain table and chair, which are preserved in the modern house.

The house of Moss stands within a few yards of the water of Blane, which has been already alluded to. Along the bank of this stream is an extensive garden connected with the present house. Here is shown the stump of a *rowan-tree* or mountain-ash, said to be coeval with the age of the poet, and from which have sprung some new shoots. There is also a stump of an apple-tree, which the water has almost undermined, and which, like the other, has a number of new shoots: this, too, is said to be of the poet's time, if not planted by his own hand. In reference to the rivulet which has received so much notice in consequence of Buchanan having been born upon its banks, and which, but for that circumstance, would have stood so poor a chance of fame, it would be improper to omit a passage in the poems of the late ingenious Professor Richardson, who long possessed the neighbouring estate of Croy. The naïads or water-nymphs of this part of the country, he imagines, to

> "—— glory in the various songs
> That celebrate their course,
> And tell what praise to them belongs,
> What dignity of source;
> What peerless dame, fair maid, or sage serene,
> Or poet, ever paced their margin green."

He then, after adverting to some other streams says—

> "Triumphant, ev'n the yellow Blane,
> Though by a fen defaced,
> Boasts that Buchanan's early strain
> Consoled her troubled breast;
> That often muse-struck, in her loneliest nook,
> The orphan-boy pored on some metred book."

The Blane is as dull and snail-like a stream as ever crept through a level piece of country; yet, in the supposition that the infant Buchanan studied on its margin, or even "paidlet" in it for eels or minnows, which there can be no doubt he did, "when summer days were prime," with what a burst of extrinsic interest is it invested!

An idea of the pecuniary circumstances of Buchanan's family may be obtained from the fact, that the farm is even yet worth only about a hundred and fifty or sixty pounds of yearly rent. It is said, however, that the adjacent farm of Carsetown, and some other pieces of land, were formerly attached to the Moss; and if this were the case, their stock of wealth must of course have been greater. There is a place among the hills, about two or three miles distant, where some remains of buildings may yet be seen—called Heriot's Shielings. These are said to have belonged to, and derived their name from, the poet's mother, and to have been a station for the milking of her ewes.

Killearn, the parish kirk-town, is, as already mentioned, about a mile from the Moss. It is a neat small village, situated on an elevated terrace at the junction of the vales of Blane and Endrick. Even here, it is impossible to survey the surrounding country without a sensation of interest; for the great features of nature must here be exactly the same as in the days when Buchanan daily visited the place, to receive the elements of human learning. From the west end of the principal street, a view is to be obtained of the lower part of Lochlomond, studded with its various islets. Among these, the most conspicuous is Inch Cailliach (the Island of Old Women), formerly the site of a nunnery, and still containing an ancient burial-ground. From this point, it resembles a corpse stretched out and dressed, there being an eminence for the face, another for the breast, and the remainder sloping away as if towards the feet. Certain dim romantic and antique associations take possession of the mind in tracing out this image. In another direction may be seen the villages of Balfron and Bucklyvie, the latter eminent in the annals of squalor and dis-

comfort. Many of our readers will recollect the rhyme prefixed to a chapter in "Rob Roy":—

Baron of Bucklyvie,
May the foul fiend drive ye,
And a' to pieces ryve ye,
For building sic a toun,
Where there's neither horse meat nor man's meat,
Nor a chair to sit down.

Some years before the publication of that novel, Sir Walter Scott (then on a visit to the Duke of Montrose at Buchanan House), was riding through this wretched village with Mr Macfarlane, minister of Drymen, and more recently Principal of the University of Glasgow. A remark from the poet, as to the uncommon filthiness of the place, brought to Mr Macfarlane's recollection the above rhyme, which he immediately pronounced to Sir Walter. It seemed to amuse him very much, and he requested Mr Macfarlane to repeat it somewhat more slowly, as if for the purpose of committing it to his memory. Mr Macfarlane heard no more of it, till two or three years after, when he found it prefixed to a chapter in Rob Roy, and felt convinced, from that circumstance, that the author of Marmion, and no other, was the author of Waverley.*

On an eminent and conspicuous situation in the village of Killearn, stands a beautiful obelisk, erected in the year 1788 to the memory of Buchanan, and measuring 103 feet in height. This tribute to genius was first suggested, at the table of a gentleman in the neighbourhood, by Mr Robert Dunmore of Ballindalloch, the person chiefly concerned in introducing manufactures into this part of the country. The subscription for the building was commenced at the place where it was suggested, and very nearly filled up—Mr Craig, who was present, contributing the design as his share. There is no external inscription; but a silver medal, hermetically sealed, is deposited in the foundation-stone, on which is engraved a Latin inscription, conveying the fact that the column was built, in memory of George Buchanan, a most celebrated poet and historian, at the expense of the neighbours of this place. It cost three hundred guineas, an amazingly small sum, considering the amount of mason-work.

Buchanan is not the only great man whose name is connected with this interesting though secluded district of Scotland. On the estate of Balglass is an ancient fort, said to have afforded refuge to Sir William Wallace. At Gartness mill, and near to a powerful cascade of the Endrick, are the remains of an old house, in which Napier, the inventor of the logarithms, spent a considerable part of his time when engaged in his calculations. It is reported that he never found any annoyance in the sound of the waterfall, which was continuous, but that the intermittent noise of the mill deranged his ideas to such a degree, that he was obliged, when busied with a more than usually profound speculation, to request the miller to stop work. He used frequently in the evening to walk out in his nightgown and cap; which, with some other oddities of behaviour, fixed on him the character of a warlock, and his studies were vulgarly supposed to refer exclusively to the *black art*. According to Professor Richardson,

Th' Endrick, in wildly lyric mood,
Displays her laurel crown,
And tells that, musing by her flood,
Sage Napier earned renown:
That oft she paused, and marked at midnight hour,
The pale lamp glimmering in his ivied tower.

It would be improper to forget that Smollett was born within sight of the native village of Buchanan, and received part of his education at the same school (Dumbarton) where that illustrious person is said to have pursued his studies, after leaving Killearn.

THE CHEVALIER D'AVENANT †

A SPANISH TALE.

During the late revolutionary war in Spain, a regiment of dragoons was raised at Madrid, which was chiefly composed of foreign volunteers. The Chevalier D'Avenant, who had served long in the French army, resided at that time in the Spanish capital, and was induced, partly by his love of freedom, and partly by the urgent solicitation of the Cortes, to take the command of this corps. Unfortunately after the Duc D'Angouleme crossed the Pyrenees, the campaign commenced under very unfavourable auspices, and the constitutionalists were not long in discovering that the success of their arms was not equal to the justice of their cause. In the action which took place at Corunna, the Chevalier D'Avenant was present with his regiment, and took an active part in the military operations of the day. In consequence of this, the troops under his command suffered severely; and when they were finally repulsed by the superior strength of the enemy, he found it quite impossible to keep them together, or preserve discipline, so as to make an orderly retreat. After the confusion of the flight was over, he mustered his scattered force, and discovered that he was left with a party of men not exceeding forty in number, who seemed to cling together rather from the desire of mutual preservation, than the hope of being able to accomplish any important services.

With this small remnant of the corps, Colonel D'Avenant continued to retreat for several days, without being engaged in any important adventures. At length he began to consider himself beyond the reach of pursuit, but still he did not neglect the precautions which were necessary in his situation. On the morning when our narrative opens, he was seen taking a survey of the surrounding country on a neighbouring hill, before the soldiers under his command left the place where they had bivouacked for the night, for the purpose of proceeding on their march.

"Yonder is the Chevalier D'Avenant," said Pierre Rigaud, a veteran soldier, addressing some of his comrades, and pointing to an officer in uniform, who at that moment crossed the ridge of a hill at a little distance, and rode towards the spot where the party was stationed.

"The colonel is a brave fellow," one of the troopers observed, "and, what is more, as fine a horseman as ever put foot in stirrup."

"Yes, indeed," Pierre replied, "but had you seen him when he led on the Chasseurs at Talavera, you would have thought such a gallant officer could never be reduced to command such a paltry picquet as this."

"A truce to your old campaigns; why, man, that affair of Corunna, the other day, showed us all very well that D'Avenant was made of the right stuff."

"Hush—look there!" the veteran exclaimed; "the colonel comes down the hill like lightning. I'll peril my life he brings news of danger with him. Get the horses ready, my lads, and prepare for the worst."

In a few moments the Chevalier D'Avenant reached the place where the soldiers were posted. He was a tall handsome man, apparently in the prime of life, with some marks of care and campaigns on his face, but still remarkably stout and vigorous in his appearance, with pleasant features, and large black eyes of unusual brilliancy. Those eyes flashed finely when he exclaimed, "There is a column of French cavalry close upon our rear—mount, soldiers, mount!"

This order was quickly obeyed; for the party was instantly in motion, and set forward at a rapid pace. For several miles the dragoons continued to push on with unabated speed; but at length they gave their horses a little indulgence on coming to a part of the road which winded up the gentle acclivity of a hill. On reaching the highest point in the ascent, they had a fine view of the surrounding country, and on looking back they had the satisfaction to find that the French had not yet appeared in sight. This discovery raised their spirits, and they proceeded to descend with fresh vigour; but they had not gone far when they observed, at a considerable distance, a large body of troops advancing to meet them. In a moment the word "halt" was given, while Colonel D'Avenant pulled out a telescope, and rode briskly in advance to reconnoitre.

The chevalier soon returned, and said to his men, "These troops are royalists, I see, by their colours; so we must go on and take up a position to the right—Forward!" The dragoons were not long in executing this manœuvre. Descending a little way, they reached a range of open country, and immediately turned off to the right of the high road, for the purpose of taking up an advantageous post on a small rising ground in an adjoining field. After they had formed into line in this situation, Colonel D'Avenant gave the usual order to load carabines, and prepare for action. When this was done, a silence of a few moments ensued, during which they attentively observed the movements of the Spanish troops, and awaited their approach in the deepest suspense.

Meanwhile, the Chevalier turned to the men under his command, and shortly addressed them:—"Soldiers!" he said, "we are now placed in circumstances of great danger, from which we can only be delivered by courage and presence of mind. If we fall back and surrender to the French, we shall certainly be condemned—many of us at least—for fighting against our country; and, on the other hand, if we throw ourselves on the mercy of these royalists, we shall probably be pillaged, and then left to perish in the dungeons of the Inquisition. Unless fair terms are offered, then, we must advance to death or victory!" This speech was received with loud cheers by the soldiers; but it was scarcely concluded, when the Spaniards, who appeared to consist of about 400 irregular infantry and armed peasantry, approached within musket shot of the position occupied by the dragoons. Colonel D'Avenant now ordered his trumpeter to sound a parley, and rode forward alone to treat with the Spanish commander, who immediately obeyed the signal, and advanced to meet him.

"Lay down your arms, else we shall cut you to pieces!" exclaimed the Spaniard.

"No, never! Hear me, Senor," said D'Avenant, with dignity and firmness. "You see we are few in number, but remember we are all well armed, well mounted, and desperate men."

"What mean you? I say you must surrender at discretion."

"And I say," the French colonel replied, with earnestness, "rather than submit to such an indignity, we are determined to cut our way through your disorderly troops, or perish in the attempt!" The commanding tone in which this was spoken had a striking effect on the Spanish officer, for he seemed embarrassed, and wavered a little before he made any reply. When at length he did speak, it was in a subdued manner.

"What terms, then, do you expect me to grant, while I command such a superior force?"

"I don't know what terms you will grant; but the terms I demand are, that you shall give us passports, and allow us to go wherever we choose, provided we surrender our arms and horses."

"Well," said the Spaniard, "to prevent bloodshed, I agree to these terms, and pledge my honour to fulfil them."

The treaty being thus summarily concluded to the mutual satisfaction of both officers, each rode back to the troops under his command. When D'Avenant apprised his little squadron of the result of his negociation, it appeared to give satisfaction to every one excepting Pierre Rigaud, the veteran already noticed, who muttered to himself, "Spanish treachery; the terms are good, but they are too good to be kept." The colonel overheard these expressions, but did not think it necessary to pay any attention to them. After issuing some instructions to his troop, he ordered them to follow him, in single files, at intervals, and dismount and deliver up their arms, according to stipulation, and gave an express command to Pierre to remain behind, to bring up the rear of the party. In a short time the dragoons had all, one by one, surrendered to the Spaniards, till Pierre was left alone on the ground; but in place of advancing, like his fellow-soldiers, he set off in an opposite direction, at the utmost speed of his horse, and, although several bullets were sent after him, he kept his saddle, and, ere long, entirely disappeared.

The suspicions of the veteran who had thus fled turned out to be too well founded. Pretending that the treaty of surrender had been violated by the desertion of one of the troop, the Spanish commanding officer determined to disregard it entirely; and, accordingly, when D'Avenant applied for the promised passports, his request was sternly refused, and he was told that he and his men were prisoners of war. Nor was this all; for as soon as the dragoons gave up their arms, they were pillaged of every thing valuable which they possessed by the soldiers, who appeared not to be under the restraint of discipline, and were allowed to do whatever they chose, provided they testified their loyalty by continually shouting, "*Viva el Rey.*" At first the colonel remonstrated against the injustice of these disgraceful proceedings; but he soon saw that all remonstrance was vain, and only increased his misfortunes; and he therefore resolved, in the true spirit of philosophy, to submit with patience to his fate.

In this unhappy situation the Chevalier D'Avenant and his comrades in arms were carried back and delivered up as prisoners to the French general. If they derived any satisfaction from reflecting that they were now in the hands of their countrymen, it was speedily damped when they were informed that they were to be sent to France under a military escort, to stand their trial for high treason. Little time was given to the prisoners to ponder on their fate, for they were obliged to set out immediately, under a strong guard, for the French frontier; and ere long, they almost lost sight of their misfortunes by the excitement of the march, and the variety of objects which attracted their attention in the course of their route.

At length, after a tedious journey, the party arrived at Bayonne, and the prisoners were committed for safe custody to the strongly-fortified castle of that place. From his superior rank, Colonel D'Avenant was now separated from the rest, and obtained an apartment for his own accommodation, so that he was left undisturbed to his reflections, and had leisure to dwell on the painful circumstances of his situation. As he possessed enlightened views, and a considerable knowledge of the world, he was sensible that the crime with which he was charged was too clearly established, and too aggravated in its nature, to leave much room for expecting a pardon; and, accordingly, although a ray of hope remained to cheer him in his forlorn condition, he had sufficient judgment and decision to enable him to make up his mind to abide the worst that could befall him. For three long days he remained confined in the castle, indulging in these unpleasant anticipations, without seeing any one but an old keeper, who brought provisions and other necessaries to his apartment, and who seemed to think it part of his duty to keep his lips hermetically sealed. At length, on the evening of the third day, this individual informed him, that early on the following morning he was to be sent to Paris along with the other prisoners, under the escort of a party of mounted gens-d'armes. On giving this information, the keeper immediately withdrew, without adding a single word of comment.

The shades of night began to fall around the Chevalier D'Avenant as he lay pondering on the intelligence which he had just received. His spirits were lightened on considering that he was not to be left any longer to be devoured by ennui, and he felt no small degree of pleasure in the thought that things

* There is another rhyme on Bucklyvie, to the same effect, but not so pointed. At the risk of appearing to persecute this unfortunate little town, we shall here submit it—

The folk o' Balfron,
The dirt o' Bucklyvie—
Canna ye hobble
And dance, as I do.

† This tale appeared originally in the "Edinburgh Literary Gazette," and is by the author of "Sketches of the Scottish Bar," &c.

were speedily coming to a crisis. Perhaps, too, the consciousness that the accusation against him in reality was merely that he had fought for the cause of liberty, tended, in some measure, to allay his anxiety, and support his courage. At all events, his thoughts on this occasion were of a very mixed kind, sometimes cheerful and sometimes melancholy; but at length, after wasting some hours in useless musing, the surrounding darkness reminded him that it was time to go to sleep, to enable him to undergo the fatigues of a journey on the morning.

Scarcely had Colonel D'Avenant formed this resolution, when he was startled by the sudden grating of the iron door of his apartment. Instantly he sprung to his feet, and observed the dark figure of a man, who entered slowly, and drew the ponderous bolts behind him. Although naturally courageous, the chevalier at this moment was certainly alarmed; for the first thought that flashed across his mind was, that he was about to be secretly put to death, like many other state-prisoners of whom he had read in history.

He immediately started back, and cried out, in a tone of evident alarm, "Who's there?"

"A friend," was the brief reply; and the harshness of the voice which uttered it was calculated to increase the suspicions of the prisoner.

The darkness of the apartment was now partly removed by means of a dark lantern. Throwing the light first on the features of the colonel, and then on his own, the stranger exclaimed, "How is this?—Don't you know me?"

"Pierre Rigaud!"—Is it you I see?—How came you hither?"

"Speak lower," said the veteran; "if the sentinel at the southern bastion hear us, we are lost."

"Yes, yes; but tell me how you have found me out, and got access to this place?"

"Ah! mon cher colonel," replied Pierre, "time is precious, and I must be brief. When you surrendered to these rascally Spaniards, you know I suspected treachery; but I was determined to follow you, and submit to my fate. However, as good luck would have it, just as I was about to close up with the last file, I heard a fellow in the Spanish ranks bawling out, '*Vamos saquear*,' the signal for plunder—so I took the hint, and made off as fast as I could. After passing through some small hardships, I disguised myself, and acted as guide to a French general of engineers, who paid me like a prince. Hearing of your misfortunes, I resolved to go after you, to attempt a rescue; but I had great difficulty in discovering the route which you had taken, and only arrived here the day before yesterday."

"Well, but how did you get in here?" D'Avenant impatiently demanded.

"I will tell you," Pierre continued. "I got admission, like a king, with a golden key; that is to say, I bribed the guards, who supposed from this disguise that I was a priest."

"You are a brave, generous fellow, Pierre; but I fear all your efforts to get me out of this stronghold will be unavailing."

"Courage, colonel, and you will soon be free. You cannot go with me at present, for the guards are anxiously waiting my return, and you should certainly be discovered; but ——"

"I see pistols in your belt," said the colonel, interrupting him; "perhaps it is possible for us to force our way in the dark."

"No, no; there are too many bars and bayonets in the way. You must wait till five in the morning, when the outer gate of the castle is open. Look here," he said, producing a paper; "this is a sketch of the way by which you will escape. On leaving this, you go along the passage, and, after turning first to the left and then to the right, you will come to an iron grating that leads to a dark winding stair, at the bottom of which you will find a postern opening into a private part of the court."

"After this," said Colonel D'Avenant, "I presume I must just pass the sentinels by force or stratagem."

"Exactly so," Pierre replied; "all the doors will be found open except the postern, of which this is the key. I shall leave the lantern, some gold pieces, and one of my pistols for your use."

"May heaven reward you for your exertions on my behalf! If I escape, I shall make the best of my way to Bordeaux, where I will be found at nightfall near the Chateau Trompette."

"Very well—adieu!" said the veteran, as he pressed the hand of the chevalier, and withdrew from the apartment.

Colonel D'Avenant listened to the retiring steps of the soldier, and, when the sound died away, lay in deep suspense, reflecting on the daring adventure in which he was about to engage. At length some rays of light began to penetrate through the small window of his room, and reminded him that it was time to set out to explore his way to the postern described by Pierre. Muffled up in his cloak, he proceeded slowly and cautiously along the passages; but he had not gone far when he was startled by a sound which issued from an adjoining apartment, and resembled the tread of footsteps. He remained motionless for a moment, but all was again silent. He then moved on with increased caution; and, keeping in view the directions which he had received, arrived at the iron grating without encountering any obstacles in his way. He tried to open this barrier, but it resisted all his efforts; and he was about to abandon his enterprise in despair, when at last the love of liberty returned, and urged him to exert all his strength, by which he succeeded in gaining a passage. Alarmed by the noise which this occasioned, he descended the secret stair in great haste, and threaded his way along the mazes of a subterranean passage, which finally conducted him to a small door, which he conjectured to be the postern.

At this moment the clock of the castle struck five; and as the sound echoed along the towers and battlements, D'Avenant hastened to apply the master-key with which he had been furnished. Delighted to find that the lock yielded, he gently opened the door and admitted the light of day; but he started back instantly when he perceived a sentinel pacing his rounds almost immediately in front of him. He deliberated for a moment on his situation, and, conscious of the danger of delay, immediately determined to hazard every thing, and advance. Before doing so, however, he attentively observed the motions of the soldier, who was elevated on a station which overlooked the inner court, and who paced backwards and forwards to prevent his limbs from being benumbed by the chillness of the morning. Watching his opportunity, when the sentinel turned his back, D'Avenant advanced close under the wall, and, gliding silently but rapidly along, placed himself behind a bastion for concealment. Waiting here for a few moments, till another opportunity offered, he executed a similar movement with equal success, by which he placed himself out of sight of the soldier on duty, and approached near the open court which led to the main gate of the castle. Having gone thus far, he was sensible that it would be impossible for him to proceed much longer without attracting notice; but drawing his cloak closely around him, and holding his pistol in readiness, he advanced under the resolution to act according to circumstances. In this way he reached a spot from which he had a view of the outer gate, which was standing open with a sentinel before it, who was singing the chorus of a favourite song on the battle of Austerlitz.

To pass the sentinel without being observed, D'Avenant saw was quite impossible. A sudden thought, however, flashed across his mind, and he immediately went openly and boldly up to the soldier, who looked at him with surprise and suspicion.

Before the sentinel had time to recover from his astonishment, the colonel addressed him in a menacing tone—"No songs on duty, sir—I shall report you for a breach of the rules of the garrison."

"Pardon, Monsieur," the soldier stammered out, imagining that he addressed some officer or inspector of the castle, and alarmed on recollecting that the catch which he had sung was a sort of lampoon on the Bourbons.

"Prenez garde donc," said D'Avenant, with a look so stern, that it increased the confusion of the soldier; and with these words he passed on at a careless pace without meeting any further interruption, inwardly rejoicing at the success of his scheme.

As soon as he found himself at liberty, Colonel D'Avenant hurried along the most retired streets of Bayonne, and after passing the bridge and the suburbs, reached the open country. For some time he continued to go along the public road in the direction of Bordeaux; but fearing that he might be pursued, he thought it more prudent to turn off the highway, and travel through the fields. After continuing his flight for several miles, he felt somewhat fatigued by his exertions, and began to walk at a deliberate pace, till he turned round, and observed with consternation a party of mounted gens-d'armes in close pursuit. Like Richard of England, he would now have given "a kingdom for a horse;" but although there was no prospect of attaining the object of his wishes, he was glad to find that he was in the neighbourhood of a wood, and he determined to make for the cover with all his speed. In a short time he heard the horsemen close behind him, and the cry of "gens-d'armes! gens-d'armes!" which they shouted as they rode along, sunk deeply into his soul. In his youth he had been a sportsman, and in the chase he had often observed a hare hard pressed by the hounds popping down, and allowing them to pass over him. The idea was not lost upon the chevalier, for he immediately lay down, and concealed himself among some brushwood; and he had scarcely done so when the gens-d'armes dashed past the spot. Fearing that his pursuers would soon return to beat up the cover, he lost no time in retracing his steps till he came to the place where he entered the wood, thinking it improbable that a search would be made in that quarter. Here he ascended a tree which offered a convenient shelter by its foliage; and he remained in this painful situation during the whole of the day, and did not think it prudent to come down till nightfall.

Favoured by the darkness, Colonel D'Avenant descended, and proceeded on his way After a tedious journey, in which he suffered many privations, and experienced many narrow escapes, he arrived at Bordeaux, the place of his destination. On going to the Chateau Trompette in the dusk of the evening, he was so fortunate as to meet Pierre Rigaud. The veteran had acquainted the friends of the chevalier with his situation, and was thus able to supply him with resources, and to conduct him to a place of concealment in an obscure part of the town. Here Colonel D'Avenan waited in suspense for several weeks, but at length he obtained a fictitious passport, and embarked in a vessel bound for the United States of America, where, notwithstanding the act of amnesty which has been passed, he still remains to participate in the advantages of those valuable rights and privileges for which he had fought and suffered, and which can only be fully enjoyed in a land of light and liberty.

DYING BEQUESTS.

THE world is frequently amused, as well as shocked, with the manner in which monied men bequeath their property. The worth of the party on whom the wealth is conferred, seems generally to be held of little consequence by the donors, in comparison with some contingent quality of little value. The idle, the dissipated, or the otherwise foolish, are too often made the spenders of those gains acquired by a long life of sober industry and virtue. It is evident, that, among the circumstances connected with the possession of property, much positive good might result to society if men were to be more careful in selecting those to whom their marks of regard extended. The amount of property intended to be bequeathed is of trifling importance when compared with the result of a discriminating principle of action.

The wisdom in selecting those most worthy, will not only secure to us their respect, but, in a great degree, promote the observance of good conduct in others. A worthy man struggling with adversity is said to partake of sublimity; it is doubtless calculated to excite our best sympathies; and the rendering of timely assistance fails not to ensure the lasting gratitude of a deserving individual: while benevolence, property in expectance or suddenly obtained, never yet produced a salutary effect on a dishonourable mind; it has rather supplied the means for acquiring additional disgrace, or has tended to shorten a dissolute existence.

It is praiseworthy in every one to render himself useful to the community of which he forms a part; and, however little of good services we may have done to others, it is certain that evil has been proportionably lessened. It is in our power to deserve the good opinion of our fellow-men, and we should neglect no opportunity, consistent with our means, to secure a reputation so valuable. This is fame, in which sense it is desirable that the love of fame should be an universal passion. Reputation should be founded on goodness exerted for the welfare of mankind; there is no foundation for fame unconnected with benevolence. It makes not against this principle, that bad men have sculptured marble to commemorate their having once lived. If neither honour nor virtue were practised during their mortal career, monuments only tend to perpetuate their deficiency in those moral attributes.

With what apathy do we pass the statues of those who were the enemies of mankind, of men who swayed the destinies of the age in which they lived! What are they now? A little dust laid in oblivion, regardless as the commonalty they injured or destroyed. Tombs may display records of greatness; and in many instances what are these? Falsities. The wrongs which the eulogised have caused, and the outrages they have perpetrated, make our hearts sick; and we turn from the gilded flatteries in disgust, or in sorrow reflect on the talent employed in such total disregard of truth. But if we behold a modest urn, in which repose the ashes of the wise and good, how different are our feelings! Their benevolence, their usefulness, their greatness of character, awake the love of virtue in our hearts, and a tear of gratitude trickles on the spot sacred to their memory. We acknowledge their reputation or fame is entitled to our respect, and we feel a dignity in being one of that class of beings who can command the homage of an existing race, and the gratitude of posterity.

To fit ourselves with judgment, so as to be enabled to distinguish between the just and the base, is worthy our most serious consideration, in order to award our praise or censure with a due regard to truth, whether it relate to the dead or the living. What can be more fallacious than the long-received adage, that "we should speak nothing ill of the dead?" If the departed individual were immoral, or despicable, it is an injury done the memory of the just to withhold the truth. It is our duty to revere the latter, and to abhor the former. It is to become an accessary to a wrong, if we consent that vice should not be held up to detestation. If we conceal a crime, because death interposed and stayed the operations of a mind prone to injustice, we outrage a moral principle. How can we hope that our honest actions may claim the approbation of our successors? or what dread can we have of their censure, if the truth be not spoken of us?

It is evident, that, in the heart of man, though steeped in transgression, there lurks a desire to deserve well of the world—an anxiety that posterity should not despise his memory. We know of atonements for wrongs, excuses or palliations of crime, charitable bequests, and various modes of purchasing the privilege, to glide into obscurity with the semblance of virtue. Some of our noblest institutions have their origin in this solicitude to obliterate the stains of guilt.

Whatever may be done to cover infamy, it is not our duty to look tamely on: the feelings of the injured

living may deserve our commiseration, but the characters of the vile deceased certainly demand our reprobation.

Often, within the limited circle of our experience, as if for our instruction, may we observe an individual struggling under a lingering disease, for which he feels there is no relief in worldly skill or friendly care. The approach of that period when the pulse shall cease to beat, consciousness be extinct, and the remains of the mass that once was man shall mingle with the earth, all strike on his heart with appalling effect. Reflection places before his lessening powers unnumbered deeds he would gladly wipe away from his memory; but they remain in their enormity not to be effaced; his mind seeks relief from such oppression, fraught with distraction. He looks abroad on nature, and feels astonished he had not before discovered its unnumbered beauties. He sees the smile of content in the countenances of others, and sighs for the joys he had neglected. It is all too late. Nothing pours the desired balm into his aching heart. Retribution rushes on his startled mind; and, while power remains, he bequeaths a portion of his property to some charity, solicitous that the deed may cover his multitude of sins; casts his eyes to heaven, and glides to that bourne whence no traveller returns.

How often may we observe the worthless beset the last hours of such a character, supplanting the honourable, and obtaining what neither affection nor justice would have awarded; yet, ere the mourning habiliments were injured by the wear, the property has been dissipated in reckless extravagance; wretchedness has befallen the vicious individuals; and they have been hurried to a premature grave, with all their imperfections on their heads. Can it be correct to cast such transactions into oblivion? Is it wise to withhold our discrimination between the honourable and the profligate? Common sense declares that justice should be administered under all circumstances. The hand of death touches not a moral axiom, nor alters a truth regarding the conduct of the living or the dead. The value of a good deed is too highly appreciated to be written in sand, that every tide or shower may obliterate; from which we may be assured, that, in selecting honourable persons to receive our benefactions, and in the disposal of our property, to separate the good from the vicious, we may induce a better regulation of conduct in those who are to be our successors, and assist in producing a rectitude in the transactions of mankind.

FUEL.

THE people of this country have coals always at hand for fuel, and are put to no inconvenience in procuring that domestic necessary, except the increase of price by their greater distance from the coal-mine; while, from the innumerable facilities of carriage by sea, river, canal, and railroad, even this little drawback is now reduced to its smallest limits. Our own facilities in this matter put us so much at our ease, that it becomes a little puzzling for us to think that there are people in the world to whom the procuring of *fuel* for warming their houses, and for cooking, is one of the most serious difficulties of life. Even in some districts of our own country, the labour of preparing this necessary article occupies several weeks of the finest and longest days of summer; in the Highlands of Scotland, and some parts of Ireland, where turf is the only procurable fuel, the peat bogs are covered during the dry season with half the population of the surrounding villages, who have first to dig out the wet peat in masses from the bogs, then to cut it into small *bricks* for the convenience of drying, and to pile these into little open heaps penetrable by the air. The time for driving them home to the farms and villages is one of equal labour; for the carts in these districts being small, and the peats bulky and light, innumerable returns have to be made to the bogs (which are often situated on the sides or tops of very high hills) before the whole can be removed. So great a proportion does the labour of procuring fuel bear to the other occupations of the year, that populous villages (such as Foggie-loan in Banffshire) often grow up in very barren districts, merely on account of the vicinity of peats; the additional labour requisite in raising corn and in cultivating vegetables in such places being compensated by the shorter carriage required from the moss.

In France there is hardly any other fuel but wood, and large tracts are reserved as forest land for this purpose. The demand outruns the supply, so that the trees are seldom allowed to grow to the size or hardness necessary for making substantial fire-wood. To supply a house in Paris with fuel, according to the comfortable proportions allowed in England, would therefore be a very expensive matter; and the people are necessitated to consider fires in their rooms as a luxury which even in very cold weather is quite beyond their reach. Fire-wood is hardly expended for any other purpose than cooking; and English students, who are attracted by the celebrity of the French medical school, often feel the occupation of studying all the evening in a Parisian room, with artificial flowers in the grate, to be quite an adequate payment for the eclat of a continental education. The houses of artizans in the towns, and of poor people every where through France, present to an English eye a very uncomfortable spectacle on this account, their fires being always extinguished as soon as the meal is cooked. This poverty of an article so essential is not owing to the want of good coal in the country; on the contrary, France possesses many mines distributed over the most populous parts of her territory. The defect is owing rather to the want of a sufficient number of good roads, and the absence of enterprise among her people, who nourish a prejudice against coal, saying they cannot bear the smell and dust which it causes. This strange reason could only operate on an indolent, unindustrious people; nor would any other allow it to impede the progress of manufactures, and of all national prosperity. They even smelt their iron by charcoal fires, at triple the cost of coal.

Spain lies farther south than France, but as its central provinces are situated on an elevated plain which is as high as some mountains, Madrid is a very cold place in winter. The scarcity of wood is here greater than in Paris, and coals are altogether wanting, so that the poor countrymen of Sancho Panza often pass the winter nights in a state of great discomfort. Fevers and consumptions are frequent maladies, consequent on the changes of temperature, and the impossibility of guarding against their effects by means of artificial heat.

In uncivilised countries, the substances used for fuel are of various, and sometimes very uncouth descriptions. Among the Arabs, camel and sheep's dung are the usual substitutes, which are used mixed with brushwood, and stalks of withered herbs from the desert; even these must be economised with the greatest care. Among the wandering tribes in the north of Syria, cattle droppings are the only fuel; and their way of cooking eggs, is, to empty two or three of them from the shells into a hollow piece of dried cow-dung, which is then placed on the embers, and, as it burns, it hastens the cooking of the omelet: this dish is reckoned savoury and rich tasted. In Aleppo, where there are no trees but those of the orchards and gardens, the fuel employed for heating the public baths consists of various ingredients—the dung of animals, the filth of stables, the parings of fruit, with other rubbish collected about the streets; and this composition, both in drying and in burning, produces a stench utterly intolerable to unpractised nostrils. It is to be regretted that the notices of travellers concerning a matter closely affecting the domestic habits of nations, are so frequently scanty and careless. Nothing can be a better measure of the progress towards civilization, than the provisions made by any people for the steady supply of fuel.

If the inhabitants of warm countries are put to difficulty from the want of fuel, what must be the case with those of the frozen north—the Laps, the Esquimaux, the Greenlanders? On the shores of the Icy Ocean, there are neither cows nor camels to furnish fuel; and, except the Greenlander could contrive to warm his kitchen with the dung of a bear, there is no other animal in all those regions fit for the purpose. He cannot even procure the stalks of herbs. It is singular how the ingenuity of man rises superior to his difficulties: the Esquimaux are able to render their huts, which are constructed of large hard snowballs, sufficiently warm and comfortable, by the economical use of a very simple kind of fuel. They have large lamps constructed of hardened clay, with wicks of *lichen* (a kind of vegetable, called in this country *stone-bark* and *white moss*), and the oil is seal-grease, or lumps of bear's fat. With these they warm their houses, and cook their victuals, and contrive to secure a number of domestic comforts. Captain Lyon says that he slept a night in one of their ice-huts, lying on a bench of snow, with a bear's skin beneath him, an immense Esquimaux dog reposing on his feet, and a lamp burning within two inches of his nose; and he never passed a warmer night in his lifetime, though he had sojourned also among the sunburnt Arabs of Fezzan.

The most singular kind of fuel of which we have heard, was that made use of by some French soldiers of the army of Bonaparte, in crossing the desert. Having been for some time utterly at a loss for the means of cooking, they came at length upon a spot where a large portion of a former caravan had perished from some of the calamities incident to travelling in the desert. The soldiers, regardless of the superstitions which would have made an Arab shudder in such a case, seized the bones, and kindled them, by the help of some brushwood, into fires, to cook their victuals, and warm themselves in the chilly nights which often succeed to very hot days in those climates. The stench which arose, was, as might be expected, truly horrible, and prevented the soldiers from enjoying their cookery as they had expected.

These examples may serve to show, that *fuel*, which we procure so easily, and use with so little thought, is in reality a valuable and rare convenience of civilised life, the regular supply of which requires a concurrence of very fortunate circumstances. It is the foundation of all domestic comfort and its scarcity or abundance has a powerful effect in fixing the habits, and even the national prosperity of the greatest countries. Without this, where were all the splendid manufactures and domestic elegancies of England? Travellers often fill their books with mere gossip, when they might give at least a slight notice concerning the price of fuel, and the kinds used—what classes are able to procure it, and what are obliged to do without—what injury or disease (in great towns particularly) are supposed to arise to the people from its scarcity—what manufactures could be carried on, were it abundant. Inquiries of this kind would throw light on several of the most essential circumstances in the fortunes and manner of a people.

BIOGRAPHIC SKETCHES.

CARL MARIA VON WEBER.

CARL MARIA VON WEBER, the composer of the music of Der Freyschutz, and many other admirable works, was born at Eutin, in Holstein, on the 18th of December 1786. Like almost every other great German composer, he was the son of a professional musician, who devoted himself at an early period to the education of his son, and afforded full encouragement to the ripening of his musical talent. In boyhood, Weber was timid, retiring, and studious, but enthusiastic in all he applied himself to. By poring upon romances, which heated his fancy, he gave that peculiar tinge to his mind which is so apparent in his compositions. He also applied in early life to painting and drawing; he even condescended for a time to the drudgeries of lithography, which was then a new discovery; but in time the whole stream of his mind was turned into the channel of music alone. So rapid was his progress under his father and other masters, that in 1798, when he was only thirteen years of age, six fugues composed by him were deemed worthy of being given to the world. Soon after, having taken a predilection for dramatic music, he composed an opera, entitled "the Power of Love and Wine," besides a mass, and numerous minor pieces, all of which, however, he afterwards committed to the flames.

At fourteen, Weber composed the music of Steinberg's opera, Das Waldmadchen (the Maid of the Woods), which was well received both in Berlin and Petersburg. Soon after, he wrote an opera called "Peter Schmoll and his Neighbours," in which none but obsolete instruments were used, and which obtained him considerable praise among the more experienced musicians of his country. For some years, Weber now devoted himself solely to the study of the principles of music, first in the cities of northern Germany, and latterly in Vienna, which is in some measure the musical metropolis of the world. He emerged from this noviciate a perfect musician. Being appointed music-director at Breslau, he continued his studies with great diligence, and occasionally employed himself in composition. In 1806, he took the direction of the theatre at Carlsruhe, at the request of Prince Eugene of Wirtemberg; and during the disturbed period which followed, he found an asylum for his subsistence and his studies in the house of Duke Louis at Stuttgard, where he re-wrote his opera of the Wood Girl, and composed various smaller pieces, including Der erste Ton (The First Sound), till the political atmosphere began to clear in 1810, and restored him to his profession. He afterwards travelled through Germany in various directions, and his operas were played with success in Frankfort, Munich, Berlin, and Vienna. In 1813, he undertook the direction of the music in the Prague theatre, but, finding the duties too laborious, and of an invidious character, he resigned the situation, and, in 1817, accepted an invitation to assist in an opera at Dresden. Here he continued in the same active course of life as formerly, at the evident hazard of his health, which never had been very good. Here also he married the accomplished actress, Caroline Brand, who was destined to become an excellent wife. His whole time was not spent on music. He also wrote short poems, tales, criticisms, and other trifles, though generally without giving them his name. Having at length worn out his strength by professional exertion, he retired to the country to recruit, and there composed his "Preciosa," and commenced "Der Freyschutz," which had long before been commissioned for the Berlin theatre, and was founded on a romance by Apel. In 1821, the newly erected royal opera at Berlin was opened with the latter performance.

The effect produced by the first representation of this romantic opera, which must ever be regarded as one of the proudest achievements of genius, was almost unprecedented. It was received with general acclamations, and raised his name at once to the first eminence in operatic composition. In January it was played in Dresden, in February at Vienna, and every where with the same success. Weber alone seemed calm and undisturbed amid the general enthusiasm. He pursued his studies quietly, and was already deeply engaged in the composition of a comic opera, "The Three Pintos," never completed, and had accepted a commission for another of a romantic cast for the Vienna stage. The text was at first to have been furnished by Rellstab, but was ultimately written by Madame de Chezy, and written in so imperfect and impracticable a style, that, with all Rellstab's alterations, never had a musician more to contend with than poor Weber had to do with this old French story. As it is, however, he has caught the spirit of the tale.

> "Dance and Provençal song, and vintage mirth,"

breathe in his melodies; and although a perplexed plot and want of interest in the scene greatly impaired its theatrical effect, the approbation with which it was notwithstanding received by all judges of music on its first

representation in Vienna (10th Oct. 1823), sufficiently attested the triumph of the composer over his difficulties. He was repeatedly called for, and received with the loudest acclamations. From Vienna, where he was conducting his Euryanthe, he was summoned to Prague, to superintend the fiftieth representation of his "Freyschutz." His tour resembled a triumphal procession; for, on his return to Dresden, he was greeted with a formal public reception in the theatre.

But while increasing in celebrity, and rising still higher, if that were possible, in the estimation of the public, his health was rapidly waning, amidst his anxious and multiplied duties. "Would," says he in a letter written shortly afterwards, "Would that I were a tailor, for then I should have a Sunday's holiday! Meantime, a cough, the herald of consumption, tormented him, and "the slow minings of the hectic fire" within began to manifest themselves more visibly in days and nights of feverish excitement. It was in the midst of this that he accepted the task of composing an opera for Covent Garden Theatre. His fame, which had gradually made its way through the north of Germany (where his Freyschutz was played in 1823), to England, induced the managers to offer him liberal terms for an opera on the subject of Oberon, the well-known fairy tale on which Wieland has reared his fantastic but beautiful and touching comic Epos. He received the first act of Planché's manuscript in December 1824, and forthwith began his labours, though he seems to have thought that the worthy managers, in the short time they were disposed to allow him, were expecting impossibilities, particularly as the first step towards its composition, on Weber's part, was the study of the English language itself, the right understanding of which, Weber justly considered as preliminary to any attempt to marry Mr Planche's verses to his own immortal music. These exertions increased his weakness so much, that he found it necessary to resort to a watering place in the summer of 1825. In December he returned to Berlin, to bring out his Euryanthe there in person. It was received, as might have been anticipated, with great applause, though less enthusiastically than the Freyschutz, the wild and characteristic music of which came home with more intensity to the national mind. After being present at two representations, he returned to his labours at Oberon.

The work, finally, having been completed, Weber determined himself to be present at the representation of this his last production. He hoped, by his visit to London, to realise something for his wife and family; for hitherto, on the whole, poverty had been his companion. Want had indeed, by unceasing exertion, been kept aloof, but still hovering near him, and threatening, with the decline of his health, and his consequent inability to discharge his duties, a nearer and a nearer approach. Already he felt the conviction that his death was not far off, and that his wife and children would soon be deprived of that support which his efforts had hitherto afforded them. His intention was to return from London by Paris, where he expected to form a definitive arrangement relative to an opera which the Parisians had long requested from him. He left Dresden early in 1826, accompanied by his friend Furstenau, a celebrated performer on the flute, travelling in a comfortable carriage, which his health rendered indispensable. His cough was less troublesome on the journey than it had latterly been. He reached Paris on the 25th of February, where he was received in the most flattering manner by all the musicians and composers of eminence, among others by Rossini, who was so anxious to see him, that he had called before his arrival, that he might ascertain the exact moment of his coming. On the 27th he was present at the first representation of Spontini's "Olympia;" and though no great admirer of the composer, the way in which the opera was performed elicited his warmest approbation. "How splendid a spectacle," says he, "is the opera here! The noble building, the masses upon the stage, and in the orchestra, are imposing, almost awful. The orchestra in particular has a strength and a fire such as I never before witnessed." The longer he remained in Paris, the more the number of his visitors increased. "I cannot venture to describe to you," he writes to his wife, "how I am received here. It would be the excess of vanity. The very paper would blush for me, were I to write down half of what the greatest living artists here tell me. If I don't die of pride now, I am insured against that fate for ever." Though thus breathing an atmosphere of flattery, and feeling his health and spirits improving amidst the novelty of the scene, his letters betray his longing to revisit his domestic circle, and his resolution never again to undertake so long a journey without the comfort of their society.

On the 2d of March, he left Paris for England, which he reached on the 4th, amidst a heavy shower of rain—a gloomy opening to his visit. The first incident, however, that happened after his arrival, showed how highly his character and talents were appreciated. Instead of requiring to present himself as an alien at the Passport Office, he was immediately waited upon by the officer with the necessary papers, and requested to think of nothing but his own health, as every thing would be managed for him. On the 6th, he writes to his wife from London—"Here I sit, well and hearty, already quite at home, and perfectly happy in the receipt of your dear letter, which assures me that you and the children are well; what more or what better could I wish for? After sleeping well and paying well at Dover, we set out yesterday morning in the Express coach, a noble carriage drawn by four English horses, such as no prince need be ashamed of. With four persons within, four in front, and four behind, we dashed on with the rapidity of lightning through this inexpressibly beautiful country; meadows of the loveliest green, gardens blooming with flowers, and every building displaying a neatness and elegance which form a striking contrast to the dirt of France. The majestic river, covered with ships of all sizes (among others the largest ship of the line, 148 guns), the graceful country houses, altogether made the journey perfectly unique."

He took up his residence with Sir George Smart, where every thing that could add to his comfort or soothe his illness had been provided by anticipation. He found his table covered with cards from visitors who had called before his arrival, and a splendid pianoforte in his room from one of the first makers, with a request that he would make use of it during his stay.

"The whole day," he writes to his wife, "is mine till five, then dinner, the theatre, or society. My solitude in England is not painful to me. The English way of living suits mine exactly, and my little stock of English, in which I make tolerable progress, is of incalculable use to me.

"Give yourself no uneasiness about the opera (Oberon). I shall have leisure and repose here, for they respect my time. Besides, the Oberon is not fixed for Easter Monday, but some time later; I shall tell you afterwards when. The people are really too kind to me. No king ever had more done for him out of love; I may almost say they carry me in their arms. I take great care of myself, and you may be quite at ease on my account. My cough is really a very odd one. For eight days it disappeared entirely; then, upon the third (of March), a vile spasmodic attack returned before I reached Calais. Since that time it is quiet again. I cannot, with all the consideration I have given it, understand it at all. I sometimes deny myself every indulgence, and yet it comes. I eat and drink every thing, and it does not come.

"At seven o'clock in the evening, we went to Covent Garden, where Rob Roy, an opera after Sir Walter Scott's novel, was played. The house is handsomely decorated, and not too large. When I came forward to the front of the stage-box, that I might have a better look of it, some one called out, Weber! Weber is here! and although I drew back immediately, there followed a clamour of applause which I thought would never have ended. Then the overture to the Freyschutz was called for, and every time I showed myself the storm broke loose again. Fortunately, soon after the overture, Rob Roy began, and gradually things became quiet. Could a man wish for more enthusiasm, or more love? I must confess that I was completely overpowered by it, though I am of a calm nature, and somewhat accustomed to such scenes. I know not what I would have given to have had you by my side, that you might have seen me in my foreign garb of honour."

The honours of this world were, however, nearly over with Weber. The tired forces of life, though they bore up gallantly against the enemy, had long been wavering at their post, and now in fact only one brilliant movement remained to be executed before they finally retreated from the field of existence. This was the representation of Oberon, which for a time rewarded him for all his toils and vexations. But his joy on this occasion was interrupted by the gradual decline of his health. The climate of London brought back all those symptoms which his travelling had for a time alleviated or dissipated. After directing twelve performances of his Oberon in crowded houses, he felt himself completely exhausted and dispirited. His melancholy was not abated by the ill success of his concert, which, from causes we cannot pretend to explain, was no benefit to the poor invalid. His next letters are in a desponding tone. His expressions in the last but one he ever wrote, show the rapid decline of his strength, though he endeavours to keep up the spirits of his family by a gleam of cheerfulness. His longing for home now began to increase till it became a pang. On the 6th June, he was to be present at the Freyschutz, which was to be performed for his benefit, and then to leave London for ever. His last letter, the thirty-third he had written from England was dated the 2d of June. Even here, though he could scarcely guide the pen, anxious to keep up the drooping spirits of his wife, he endeavours to speak cheerfully, and to inspire a hope of his return.

On Friday, the 3d of June, he felt so ill that the idea of his attending at the representation of "Der Freyschutz" was abandoned, and he was obliged to keep his room. On Sunday evening, the 5th, he was left at eleven o'clock in good spirits, and at seven next morning was found dead upon his pillow, his head resting upon his hand, as though he had passed from life without a struggle. The peaceful slumber of the preceding evening seemed to have gradually deepened into the sleep of death.

He was interred on the 21st, with the accustomed solemnities of the Catholic Church, in the chapel at Moorfields, the Requiem of Mozart being introduced into the service. In person, Weber is described as having been of the middle height, extremely thin, and of dark complexion. His countenance was strikingly intelligent, his face long and pale, his forehead remarkably high, his features prominent, his eyes dark and full. His usual look was one of calm placid thought, an expression which was increased in some degree by spectacles, which he wore on account of his shortness of sight. The force and acuteness of his mind were indicated in the occasional brilliancy of the expression of his countenance; the habitual patience and mildness of his disposition, in its permanent look of placidity and repose.

As a composer, amidst the flood of excellence which his works display, we have some difficulty in singling out the quality for which he stood most pre-eminent. We think, however, that he was in no respect more distinguished than for the perfect originality of his style. He imitates no particular master, he is the slave of no particular school, and can scarcely be said to take the cue from any of his predecessors or contemporaries. He walks in a path decidedly and peculiarly his own; and yet with all this originality, with a style so strongly, so indelibly marked, that it can never be mistaken, he is perhaps less of a mannerist than any composer of his day. The character of his music always varies with the subject. Unlike that of some, it is no Procrustes'-bed, to which all themes whatever are forcibly subjected, and fitted in so as to correspond with its precise form and dimensions. On the contrary, his compositions, as they invariably spring from the contemplation of the subject possess all the beauty and variety incident to it; and when we turn to his laughing chorus, the striking and singular effect of which is produced by the adaptation of the very phenomenon which usually takes place on the vocal organs when the risible faculties are agitated—to the cries of terror and dismay which break from Max, when struggling to escape from the demon, and to many other passages of his works, we are impressed with the idea that the object which he had constantly in view was simply to modulate the voice of nature, so as to bring it within the laws of musical expression. So completely, indeed, has he followed the course which nature points out, that we may apply to him with the most perfect justice, the high eulogium which Pope pronounces on Shakspeare, when he describes him as being "less an imitator than an instrument of nature," and adds, "that it is not so just to say of him that he speaks from her, as that *she* speaks through *him*."

The consequence of this is, that his works are remarkable for the individuality of their character; and, in this respect, they admit of being favourably contrasted with those of his great rival, Rossini. His Freyschutz, his Preciosa, his Oberon, his Euryanthe, are so distinct from each other, we may venture to say, that, with a person ignorant of their author, they might pass for the productions of a different artist.*

SWAN RIVER SETTLEMENT.

No settlement that the English has formed in recent times in a distant territory, for purposes of emigration, has failed so completely in its objects as that upon Swan River, on the west side of the continent of Australia. Various causes have been given for this unfortunate result, the chief being the general bad quality of the land in the interior, or at a distance from the river, and the difficulty, if not impossibility of getting steady labourers and mechanics. Lieutenant Brereton, in his recently published work, "Excursions in New South Wales," &c., thus describes the appearance of this settlement:—

"We arrived (says he) at Swan River; and it may be imagined how much our curiosity was excited to see, with our own eyes, a spot of which such a variety of accounts had been published.

This place was known to the French long before the English thought of colonising it; but they seem to have entertained no very high opinion of its beauties or capabilities. The coast, to some distance on each side of the entrance to the river, has a most wretched appearance; nothing being visible save barren rocks or a sandy beach, with a dreary-looking country beyond; in short, a more inhospitable spot is rarely to be found; and a vessel driven upon the rocks formed an object which did not conduce to animate the scene.

Freemantle, at the time of my arrival (October 1829), was a mere encampment, every person being either in a tent or temporary hut. Its site is a level spot, consisting entirely of sand, and the 'bush' or forest extends to within a very short distance of it. Water was easily procured by digging holes a few feet in depth, but it was not particularly good, and that which we took on board at our departure was not drinkable. I understand, however, that a plentiful supply has been found since, and of a good description. The only spring near the place was about a mile distant, and it fell into the river only a few yards from its source.

If the site of Freemantle alone be considered, a worse spot for a town could hardly have been selected. Situated as it is upon a bed of sand, and exposed to a glare that is almost insupportable, it holds out but little inducement for any person to fix his residence there, unless compelled by circumstances.

It was not a little curious to observe the incipient town during the first few months after its commencement. Tents and huts in every variety—goods of all descriptions scattered about in disorder—the emigrants employed, some in cooking their provisions, and others in sauntering about, or landing their effects—many looking very miserable, and not a few equally happy—different kinds of animals just landed, and showing evidently how much they must have suffered during so long a voyage. Such was the scene I witnessed on landing at the spot on which the future principal seaport of Western Australia was to stand.

At the entrance of the Swan, which is close to Freemantle, there is a bar on which the depth of water does not exceed six or seven feet; and often, even when the wind is moderate, the passage over it is not a little hazardous. From thence to Perth, the distance is about nine miles; and the navigation is rather impeded by shoals, which in some places extend nearly across the river.

On approaching the township, one part of the river forms a lake several miles in extent, which would make a fine harbour if a canal could be cut so as to admit large vessels. Its shores are rocky, and generally useless to the agriculturist. Perth, the intended capital, stands on a rising spot, covered, when I was there, with trees, in the midst of which the settlers had pitched their tents or erected their huts; and the situation is not only well chosen, but affords some

* Condensed from a memoir in the *Foreign Quarterly Review*, which is partly derived from a German life of Weber, and partly from the personal knowledge of the writer.

highly interesting views. The river at this part is about half a mile wide, or rather more, but it is so shallow that it may sometimes be forded.

A mile or two above Perth there are several islands; and the river at this spot was so shallow, that we were obliged to get out of our boat, and drag or lift it through the mud for some distance; after which we found ourselves again in deep water, and it soon became fresh.

From this part of the river, to a distance, as well as we could judge, of twenty-five or thirty miles above Perth—that is to say, as far as we could proceed in a boat—the scenery was frequently of a beautiful description, and the banks in many places were composed of a rich alluvial soil, covered with excellent grass. Unfortunately, the good soil was rarely found to extend more than half a mile from the river, and often not more than fifty or a hundred yards. The land, to a greater distance, may be capable of cultivation; but we lost sight of the black mould, and observed beyond it sand and ironstone.

In some parts, the country was thickly clothed with forest; but in others, it had the appearance of a fine park, in which scarcely a tree was to be seen that one would think it necessary to destroy.

It has been confidently asserted that the land is *generally* so scantily wooded that there are not more than *two trees to the acre!* Nothing can be more absurd, for it is only here and there that such is the case, the country being more commonly what is denominated 'open forest,' with spots where the trees are very close together.

We made a point of landing wherever we perceived an indication of good land, and frequently discovered the holes which had been dug by those who had preceded us, in order to ascertain the nature of the soil, and saw at once the cause why some persons had been so greatly deceived. Instead of proceeding in a direct line *from* the river, they had, in consequence of their ignorance of its course, passed partly across an elbow or bend formed by it, without being aware that they were all the time not far from its banks; so that they were led to believe the black mould extended several miles *from*, instead of *along* it.

The Canning falls into the Swan a little below Perth, on the opposite side, and in most of its features resembles that river, but it is smaller.

Our party ascended the stream as far as the fallen trees permitted, which was not more, I think, than fifteen or sixteen miles from its confluence with the Swan. Its banks are highly picturesque—often romantic; and it struck me there was rather a larger proportion of good soil than on the last-named river; but even on the Canning, it extends not farther than from half to three quarters of a mile, and very seldom so far.

Between Perth and Freemantle, the land, in an agricultural point of view, is almost worthless, if we except a few small spots; the greater portion of it consisting of sands or sandstone covered with trees and underwood.

The base of the Darling range approaches to within a very few miles of Perth; but the declivities of these hills had not the appearance of being particularly abrupt, and their elevation is considered to be only about 1200 feet, which I am inclined to believe is somewhat underrated. Their aspect is triste and displeasing. How far inland the range extends is not known; but some officers had gone up the Canning as far as they could in a boat, and then walked, according to their statement, upwards of forty miles, when, seeing no apparent termination to the range, and their provisions being well nigh exhausted, they were obliged to retrace their steps.

They said (and there is every reason to believe their information to be correct) that the soil was bad or indifferent, excepting sometimes at the bottom of a valley or ravine; nor did they see much land adapted even for the purposes of grazing: indeed, their account of the interior was far from cheering.

On the Canning, we fell in with twenty-one of the *aborigines*, a greater number than had been previously seen in a body. They were of good height, straight-limbed, very slightly made, and appeared to be extremely active. As though they were not naturally sufficiently ugly, many of them had thrust a feather, a bone, or a piece of wood, through the septum of the nose; and the same practice was observed on various parts of the east coast by Cook's people, who gave to the ornament the appellation of spritsail-yard."

Other writers mention that good land *is* plentiful in this settlement, and that the only serious evil which exists is the want of steady labourers and artizans. The author of a new work, entitled "England and America," has the following observations on this subject:—

"This colony may prosper in the course of years; but for the present it must be considered, when compared with the expectations of those who founded it, a decided failure. Why this failure with all the elements of success, a fine climate, plenty of good land (in proportion, perhaps, to the population), plenty of capital and enough of labourers? The explanation is easy. In this colony, there never has been a class of labourers. Those who went out as labourers no sooner reached the colony than they were tempted by the superabundance of good land to become landowners. One of the founders of the colony, Mr Peel, who, it is said, took out a capital of L.50,000 and three hundred persons of the labouring class, men, women, and children, has been represented as left without a servant to make his bed or fetch him water from the river. The writer of the first book concerning this colony states, that, landing in Cockburn Sound with goods taken from England, he did with some difficulty procure workmen to place his goods under a tent; but that there, for want of workmen to remove them, they remained till they were spoiled, as the tent became rotten. In such a state of things it was impossible to preserve capital. While Mr Peel was without servants, his capital perished; but as soon as his capital had perished for want of servants, those who had been his servants insisted on his giving them employment. Having tried a life of complete independence, and felt the pains of hunger, they now wanted to become labourers again. At one time Mr Peel was to be seen imploring his servants to remain with him; at another, escaping from their fury at his not being able to give them work. The same thing happened in many cases. In each case it was owing to the facility with which people—labourers when they reached the colony—became independent landowners. Some of these independent landowners died of hunger; and at a time, too, when, as it happened, a large supply of food had just reached the colony from Van Dieman's Land. Many of them, both capitalists and labourers, capitalists with capital and labourers without work, have removed to Van Dieman's Land; the cost of passage for the latter being defrayed by settlers in that prosperous island."

Such are a few characteristics of the Swan River settlement, a place to which we would advise no emigrants to proceed, however deplorable their condition be in this country. In the colonies of New South Wales and Van Dieman's Land, a certain degree of comfort is sure to be obtained; but in this settlement, every thing seems so ill arranged, and the accounts of it are so contradictory, that, in the meanwhile, we consider it would be dangerous to proceed to it with the expectation of finding a comfortable home.

JOLLY YOUNG COLLY.

A poetical *jeu d'esprit*, from "Notes upon Notes," &c. by Henry Warren. London, 1832.

There's jolly young Colly, of Hollywood Hall,
Has gallopped, and whallopped, and trollopped through all
The estate of his pater, till great is his fall—
Poor Colly!

For gemmen, and flashmen, and others beside,
And joskins in buckskins who horse-skins could stride,
Were welcome, if they'd come and help him to ride
Through his fortune.

And he called 'em his *friends*, and he lent 'em his pounds,
While they plucked him, and sucked him, so out of all bounds,
That the neighbours all said he fed *two packs of hounds.*
Hark forward!

And hence his expenses, and thence is the cause,
As you'll guess, that distress and that pest of the laws,
A bailiff, one day left the mark of his claws
On his shoulder.

Now, though hunter himself, he was hunted full sore,
Being *sued* and *pursued* the whole county quite o'er,
Till his creditors said it was *nunting a bore*,
A hard run.

It was hark away, bark away, mark the way—go—
But the game was soon ended, so Friendship cried Wo!
Though *tapsters* and *milkwomen* cried *tally* owe!
Tally ho!

Oh! he'd oft *cleared* a *bank* with his high *mettle* roan,
And he'd *cleared* his *bank* now, for his metal had flown;
But one bank he could not clear, that he must own—
Banco Regis!

Erst he swept over, leaped over, many a *bar*,
But, alas! here the bars were, he found higher far;
So, though *bootless*, he gave to his *spirits* the *spur*
With the *bridle.*

Poor Colly! *your roan* is no longer *your own*,
Nor your bay, nor your gray, nor your brown, nor your dun;
Their bright hues, like yours, have now sunk into one—
Dun Brown.

LONDON DURING THE PLAGUE OF 1665.*

On entering Holborn, I was surprised to see all the people walking in the middle of the street. They had done so, in fact, in the other streets, but the narrowness of the latter had hindered me from noticing it. The silence was still remarkable, broken only by those remote sounding cries of which I have spoken, by the noise of a few coaches, and by the sound of a church bell, as if it were some rainy Sunday evening. It was noon, however; not a drop of rain had fallen for weeks; the air was sultry to the last degree; and the fires that were burning here and there, though lit on purpose, and of use in purifying it, added to the sense of oppressiveness. Yet the people had their coats buttoned up, and their necks muffled, as if they feared every breath of the atmosphere.

I had heard of a man who went about crying—"Yet forty days and London will be destroyed;" and of another, who, half naked, and never stopping to answer questions, hurried unceasingly through the streets, looking frightfully before him, and exclaiming, "O the great and the dreadful God!" I saw nothing of this; nor were the looks of the passengers, as far as I noticed, different from what they usually appeared in that careful part of the town; only they were more silent, and now and then the general attention was directed to the bustle at some door, where a person in sick clothes was brought out to be taken into a coach. But nobody stopped. I saw one of these persons go by in a coach, for I could not help looking in. It was a woman, as pale as the sheet that wrapped her. She had her mouth open, and cast a dull glazed look at me; but I quickly turned my eyes. The stream of passengers was now and then painfully interrupted by some one in liquor, not always a man; nor was it possible to know whether the drunken person was afflicted or merely brutal. One of these, a woman, after reeling every body out of the way, fell with such weight on the ground, that I instinctively ran to pick her up; when the rest cried out to me not to touch her, and presently there was a call of "Cart! Cart!" Upon which the cart made its appearance, that took people of this sort to the pest-house. It is supposed that many persons got dreadfully punished in this way for their intoxication; for the cart itself was enough to infect them. The sickness exhibited itself sometimes in the universal languor of the frame, sometimes in raging fevers, and often in boils and blains, which caused the sufferer the acutest agony. It was brought from Holland by infected goods, and detained by dirt and by narrow streets. Those stood the best chance of escaping who kept themselves cleanest, and were of the liveliest temper.

But what I had seen in this great open thoroughfare, however awful for its silent multitude, all avoiding the houses, was nothing to what I encountered in a lane, turning from Newgate Street into Little Britain. The riotous taverns and public-houses, of which I had been told, I did not witness any where, though doubtless they existed. I fancied, by the noise, that I might have passed one upon Snowhill; but there was none of that riot and swearing at open windows, which in this desperate situation of things, it was both too shocking to think of and too easy to believe. The worst noise I heard, after the outcry for the cart, was one of violent lamentation and shrieking in a house shut up, with a watchman standing before it. The people, however, took no notice; the watchman took none; and I passed on with the rest, feeling, for the first time, what it was to grow disregardful of misery, or to force myself to be so, by reason of its very excess. This was surely dreadful enough; and yet, to me, it was little to what I am about to mention.

The lane into which I turned was one of the most silent. The houses were all shut up, and yet I did not observe a single watcher at the doors. (Watchers were people stationed at sick houses to see that nobody went out). By this I concluded that the inmates were all dead, which very much astonished me. I have thought it strange that death should have proceeded in so regular a manner with a whole street. By what I heard afterwards, I concluded that the greater number of the inhabitants had quitted their business, and fled into the country; while the watchers being few in number, and not overlooked, had most probably, at the time of my passing, gone to take their refreshment, perhaps had abandoned their posts altogether, or gone in-doors, and taken possession without leave; for numbers of such stories were told of them. Be this as it may, a great mortality had taken place in that street, and death was still in it. I was walking on the shady side of the way, to avoid the terrible dead heat (for there seemed a mortality in the very sunshine), when I heard great cries on the sudden, in a house a little beyond, on the other side of the way, and (the door being, I suppose, already open) I saw a figure, like a man in his grave-clothes, burst forth, with his family at his heels, crying, "Father! Father!" He fled up the lane, brandishing his arms and clothes, and I lost sight of them in the turning. I was pondering on this spectacle, when I observed a man coming towards me on my own side, very quiet, though dejected, who passed me without noticing what he had seen. I was not sure that I had come the way I had been directed, and, turning about just as he had passed me, I asked him the name of the street. He looked right in my eyes, with one of those sudden and equivocal smiles which drunken men sometimes put on, though nothing could be staider than his movements, and said, "Don't you know the name of this street?" In my confusion I was beginning to move off without a word, as we do when deranged people address us, when he burst into peals of laughter, so loud and reiterated as to bring two or three people to the windows, but they said nothing, and almost as instantly withdrew. I was then moving on, when he called to me in a rational and very moving tone, "Sir, sir—I say." I could not help turning round, upon which he came nearer, and said, with tears in his eyes, "Every one dead, sir; six in the family, with their mother; I have seen them all put into the pit." "You afflict me, sir," said I, "beyond measure; I feel heartily for your troubles." He looked stupified, and as he was beginning to smile again, and (to say the truth) I felt both horror and fear, I again moved off, gradually increasing the rapidity of my progress. On reaching the turning of the way, where it rounded off, I could not resist a desire to look back, when I saw him standing in the middle of the street, thrusting his right hand violently into the air, and making signs for me with the other to return. I hastened to get out of his sight.

* From a novel entitled "Sir Ralph Esher," by Leigh Hunt. London, 1832.

A Column for Young People.

THE BOAT-BUILDERS.*

"COME, papa, and mamma, and Emma, said Frederick, as he just looked into the room, holding the door in his hand; "Tom Hudson has got the boat ready; and I can pull too; and when you like, we can put up the sail. And the sun is so bright—and the meadows and hedges so green—and there's such a nice breeze! How we shall enjoy it!"

The request thus urged, with a countenance all animation and vivacity, was immediately granted; and the domestic party were soon down the flight of steps, over the lawn, and along the lane a little to the right, where Tom was waiting in his nice new boat, called "The Prize," from his having won it at a recent regatta. All were quickly seated, and most delightfully did they glide along; when, as Frederick was wondering at what rate they were going, Mr Elwood asked if he ever heard of a boat which would never fill with water, even when exposed to the violent torrents which frequently accompany a thunderstorm.

"I have read of the life-boat," said Frederick.

"The life-boat," said his father, "is truly valuable; it is the result of much skill and perseverance; but I am thinking of one which is made, not by man, but inferior creatures, and is the result of instinct rather than intelligence."

"I never yet heard of that," replied his son; "and as you, papa, know every thing, how pleasant it will be for Emma and myself to hear all you can tell us; and though mamma has heard it before, I think, for our sakes, she would like it again."

"I should be quite as delighted as yourselves, my dears," was Mrs E.'s prompt and kind reply.

F. But, papa, you have not told us yet who this famous boatmaker is.

Mr E. The gnat, my dear.

E. What, papa! the disagreeable little creature that bit my neck some time ago?

Mr E. The same, my dear. The instrument which the gnat employs is very complicated and amusing. Did you ever see a set of lancets?

F. Yes, papa; when Mr Ferguson called, he took a little case of surgical instruments out of his pocket, and showed me what was inside.

Mr E. Such, then, is the tongue of a gnat: it consists of five pieces, and is shut up in a case, which is split from one end to the other, and gives steadiness to the instrument whenever it is used. It is not this, however, which causes the irritation, but it is occasioned by a fluid, which the gnat injects or throws in, to render the thick blood sufficiently thin to be sucked up through the trunk, or case, we have before spoken of.

F. That is very singular. Does the gnat undergo changes, like the butterfly?

Mr E. O yes; the larva, or grub of the gnat, inhabits the water, and is therefore called aquatic. It usually swims near the surface of the water, with its head downwards, and its tail in the air, for a purpose which will presently be obvious. It may be met with in abundance during summer, in ditches, or in water-butts, appearing like a minute, whitish, semi-transparent shrimp, or fish, when its body is a little bent, as it frequently is. Its organs for breathing are situated in the tail, a tube for which goes off from the last ring of the body, and both of these end in a sort of funnel, composed of hairs, in form of a star, anointed with oil, so as to repel water. Swammerdam remarks, that, when, by handling it too roughly, this oil is removed, the grub "can no longer suspend itself on the water; I have observed it put its tail into its mouth, and afterwards draw it back, as a water-fowl will draw its feathers through its bill to prepare them for resisting water. When it wishes to descend to the bottom, it folds up the hairs of the funnel, but by means of its oil retains at their ends a globule of air; and when it wishes to arise, it has only to open its hair funnel again." Its metamorphosis into a winged fly is very curious.

E. Every thing you explain to us is so, papa; who would have thought that such a little teasing creature was so wonderful?

Mr E. When it is prepared to change its element, the insect rises to the surface, the body is divided, and as soon as the aperture is large enough, the head of the gnat appears in its perfect shape; and then the animal, which has been hitherto aquatic, has nothing to dread so much as the water; for as yet its legs and wings are soft, moist, and bound up, so that they can be of no use, and were the water to touch its corslet, it would certainly and instantly perish.

F. Ah! there's no life-boat for a gnat!

Mr E. Not by Captain Manby, my dear, but one has been provided in itself by the great and beneficent Creator. For, as soon as it puts its head out of water, it raises itself almost perpendicularly, and literally becomes a canoe, of which its own body forms the mast and sail. The skin floats, and when the observer perceives, says Reaumur, how much the prow of the little bark sinks, and how near its sides are to the water, he forgets at the moment that the gnat is an insect which at another time he would kill; nay, he becomes anxious for its fate, and the more so if the slightest breeze play on the surface of the water; the least agitation of the air suffices to waft the creature with swiftness from place to place, and make it spin round and round. Its body, folded in its wings, bears a greater proportion to the little skiff than the largest mass of sail to a ship: it is impossible not to dread lest the insect should be wrecked; once laid on its side in the water, there is no escape. Multitudes, indeed, thus perish, but generally all terminates well, and the danger is over in a minute. After having stood erect, it draws out its two fore-legs, and, bending to the water, places them on its surface, which is firm ground for a gnat's weight, and then all is safe; the wings dry and expand, and the insect, quitting the water, where it was born, rises into the air.

F. Are there many of these wonderful little creatures?

Mr E. It is supposed, that, from the end of May to that of October, six or seven generations are born; and each gnat is able to lay two hundred and fifty eggs. Indeed, were they not devoured by fish, water-fowl, swallows, and other animals, the air would often be darkened from their immense multitudes, so that, though they only tease and annoy us now, they would become a sort of plague. So numerous were they in 1736, that vast columns of them were seen to rise in the air from Salisbury Cathedral, resembling at a distance columns of smoke, so that many thought that fine building was on fire. A similar occurrence produced the same effect at Sagan, in Silesia, in 1812. At Norwich, in the following year, the inhabitants were alarmed by the appearance of smoke issuing from the upper window of the spire of the cathedral, which most probably arose from the same means. And in 1766, they appeared at Oxford, in the form of a thick black cloud darkening the air. Six columns of them were observed to ascend from the boughs of an apple-tree, to the height of fifty or sixty feet; and their bite was exceedingly envenomed.

F. Why, papa, they are as bad as the mosquitoes of which I was reading yesterday.

Mr E. The mosquito is only a large variety of the common gnat. It is found abundantly in the woody and marshy parts of all hot climates; and throughout Lapland, Norway, and Finland, and other countries equally near the pole, during their short summer. Can you remember, Frederick, any proofs of their ravages?

F. I think I can, papa. It is said that Sapor, king of Persia, was compelled to raise the siege of Nisibis by a plague of gnats, because they attacked his elephants and beasts of burden, and so caused the rout of his army. In the polar regions they are very terrible, for they seem able to resist any degree of cold, as well as to bear any degree of heat. Sometimes in Lapland they are compared to a flight of snow when the flakes fall thickest, or to the dust of the earth.

Mr E. That will do, my dear; mamma has just been reading Clarke's Travels, and will tell us what is stated by that eminent traveller.

Mrs E. He informs us, that in spite of gloves, clothes, and handkerchiefs, the bodies of himself and his companions became one entire wound, and that the irritation and swelling excited much fever. On a most sultry night, when exhausted by pain, heat, and fatigue, he sought refuge in his carriage; he could not venture to open a window, though almost suffocated. Still swarms entered his hiding-place, and, though he had bound up his head with handkerchiefs, filled his mouth, nostrils, and ears. At length he succeeded in lighting a lamp, which was instantly put out by such a prodigious number of these creatures, that their carcases actually filled the glass chimney, and formed a large conical heap over the burner.

Mr E. Thank you, my dear; now perhaps Frederick can relate how the Laplanders contrive to keep them out of their huts?

F. They burn a fire throughout the day, and, to defend themselves while in bed, the Laplander fixes a leathern thong to the poles of his tent, over his bed, which raises his canvass quilt to a proper height, so that its sides or edges touch the ground; under this he creeps, and passes the night in safety. So loud is their buzz as to disturb, almost as much as their bite, the rest of persons exposed to their attacks. The more wealthy inhabitants of climates where they abound, usually sleep under nets of gauze.

E. Papa, you said just now that before the gnat began to fly, it became a canoe; was this all you meant, when you said it was a boat-builder?

Mr E. No, my love; when the female gnat has laid her eggs, she makes of them a little boat. Each egg is shaped like an olive or a powder-flask, and, by itself, would sink to the bottom of the water; yet the gnat puts the whole three hundred together so skilfully, that they all swim on the surface, safe and unhurt, until the larvæ or grubs of the gnats are hatched.

E. It is very surprising, papa, that so large a number should float, while one would go to the bottom of the pond. But I think you will let us into the secret.

Mr E. A gnat has six legs; the four fore-legs she rests on a floating leaf, or on the side of a bucket, if she is in water contained in such a vessel; and her body is thus held level with the water, except the last ring of her tail, which is a little raised. She then begins to use her two hind-legs, which she crosses in the shape of the letter X, the open part of which, next the tail, serves as a kind of scaffold for the eggs she lays, until the boat is nearly formed. Each egg, when laid, is covered with a sort of glue; the gnat holds the first-laid egg in the crossed legs until the second is placed by its side, and fastened to it; she then glues to these another egg, making a triangle, or three-sided figure; and this is the beginning of the boat. Thus she goes on piling egg upon egg, always keeping the boat in proper shape by her useful hind-legs; and, as it grows in size, she pushes it from her by degrees, still adding to the unfinished end next her body. When the boat is half built, her hind-legs are stretched out like two parallel lines, and she holds up the boat as cleverly as if it were done with two oar stretched arms.

F. And is it much like a boat, papa?

Mr E. Yes, my dear; it possesses not only the form, but also most of the other properties of a boat; its fore and hind parts being sharper and higher than the middle; the lower part on which it always floats being convex, and the upper part concave. It is likewise so buoyant that no agitation of the water, however violent, can sink it; and, what is still more deserving of admiration, although hollow, it will not sink. Mr Kirby says, "To put this to the test, I put half a dozen of these boats upon the surface of a tumbler half-full of water. I then poured upon them a stream of that element, from the mouth of a quart bottle, held a foot above them. Yet, after this treatment, which was so rough as actually to project one out of the glass, I found them floating as before, and not a drop of water within their cavity."

* From "Art in Nature or Science Anticipated:" Westley and Davis, London.

AGED GARDENERS.

Perhaps it may gratify those who seek for health, by their attachment to gardens, to note the age that some of our English horticulturists have attained to: Parkinson died at about 78; Tradescant, the father, died an old man; Switzer, about 80; Sir Thomas Browne died at 77; Evelyn, at 86; Dr Beale, at 80; Jacob Bobart, at 85; Collinson, at 75; a son of Dr Lawrence (equally fond of gardens as his father), at 86; Bishop Compton, at 81; Bridgman, at an advanced age; Knowlton, gardener to Lord Burlington, at 90; Miller, at 80; James Lee, at an advanced age; Lord Kames, at 86; Abercrombie, at 80; the Rev. Mr Gilpin, at 80; Duncan, a gardener, upwards of 90; Hunter, who published *Sylva*, at 86; Speechley, at 66; Horace Walpole, at 80; Mr Bates, the celebrated and ancient horticulturist of High Wickham, who died there in December 1819, at the great age of 89; Marshall, at an advanced age; Sir Joseph Banks, at 77; Joseph Cradock, at 85; James Dickson, at 89; Dr Andrew Duncan, at 83; and Sir U. Price, at 83. Mr Loudon, at page 1063 of his Encyclopædia, informs us that a market garden and nursery, near Parson's Green, had been, for upwards of two centuries, occupied by a family of the name of Rench; that one of them (who instituted the first annual exhibition of flowers) died at the age of ninety-nine years, having had thirty-three children; and that his son (mentioned by Collinson as famous for forest trees) introduced the moss-rose, planted the elm-trees now growing in the Bird-cage Walk, St James's Park, from trees reared in his own nursery, married two wives, had thirty-five children, and died in 1783, in the same room in which he was born, at the age of a hundred and one years. Reflecting on the great age of some of the above, reminds me of what a "Journal Encyclopédique" said of Lestiboudois, another horticulturist and botanist, who died at Lille, at the age of ninety, and who gave lectures in the very last year of his life. "When he had (says an ancient friend of his) but few hours more to live, he ordered snow-drops, violets, and crocuses, to be brought to his bed, and compared them with the figures in Tournefort. His whole existence had been consecrated to the good of the public, and to the alleviation of misery; thus he looked forward to his dissolution with a tranquillity of soul that can only result from a life of rectitude; he never acquired a fortune; and left no other inheritance to his children but integrity and virtue."—*From a volume, entitled "On the Portraits of English Authors on Gardening."*

INTELLIGENCE IN CARD-PLAYING.

The alleged origin of the invention of cards, produced one of the shrewdest replies I have ever heard given in evidence. It was made by the late Dr Gregory, of Edinburgh, to a counsel of great eminence at the Scottish bar. The doctor's testimony went to prove the insanity of the party whose mental capacity was the point at issue. On a cross-interrogation, he admitted that the person in question played admirably at whist. "And do you seriously say, doctor," said the learned counsel, "that a person having a superior capacity for a game so difficult, and which requires, in a pre-eminent degree, memory, judgment, and combination, can be at the same time deranged in his understanding?" "I am no card-player," said the doctor, with great address, "but I have read in history that cards were invented for the amusement of an insane king." The consequences of this reply were decisive.—*Sir W. Scott.*

No. 97. SATURDAY, DECEMBER 7, 1833. PRICE THREE HALFPENCE.

BAD TIMES.

THE everlasting cry of bad times is one of the most curious specimens of popular error that we know of, and might almost be held to indicate a radical deficiency in the powers of the human understanding. We do not recollect any period so happy, but what the cry of bad times was general: it was so, as we distinctly recollect, during even that period of unnatural prosperity immediately before the conclusion of the late war. The only explanation that can be given to so self-evident a delusion, is, that it originates with the unfortunate and the imprudent—always a large body—and is readily echoed by those who are otherwise, in order (if we may use the expression of the old Highland laird) "to keep the rest off them." The unprosperous save their self-love by putting it all upon the times; and the prosperous save their gains by pretending to be poor likewise: with the one set it is an excuse; with the other it is a defence: and so the fallacy spreads.

The complaints of the labouring portions of the community regarding the increasing severity of their lot, are entitled to more respect, for their case is a new one, and it is befitting that statistical inquirers should endeavour to ascertain how far the system of monotonous labour, which now obtains in large masses of the community, is compatible with their moral and physical happiness. It may be a grinding toil which is generally endured by these masses; and we are not prepared to say, that, considering the complete abandonment of liberty which is part of his condition, the workman is in general paid better, or, to use an expressive phrase, is better off than his forefathers relatively were. If a condition of labour, however, attended by a considerable share of personal comforts, be better than a condition of comparative idleness, unattended by nearly so large a share of those appliances, the labourer of the present day has no title to cry out, "Bad times."

One of the grand causes of this fallacy is the ignorance of the majority of the people regarding any other time than the present. If the middle classes knew how poorly, in comparison, their predecessors lived—if the labouring classes knew what unutterable hardships and discomforts were endured by those who have gone before them in the same humble but useful walk of life—there would be much less of this standing charge against the present age.

We need go to no country more distant than our own, nor to any remoter period than what is recollected by thousands of persons yet living, to find abundance of proof, that in all the conveniences of life the present time is incomparably superior to the past. We shall take the condition of the poor as the best criterion, because the richer sort of people can at all times command advantages which render the progress of domestic comfort less perceptible in their instance. The change from the lumbering and hard-bottomed elbow-chair to the soft settee, is much less decisive of the point at issue, than that from a dwelling, where the snow blew into the chimney-nook, to a snug cottage, both air-tight and water-tight. The houses of the peasantry fifty or sixty years ago were deficient in comfort, to a degree that ought to make those who extol past times shudder and hold their peace. Constructed of mud, of turf, or of alternate layers of turf and stone without any cement, and with thinly thatched roofs, they were pervious at almost every point to wind and rain. Built in numerous instances at the bottom of steep slopes, with the door on the side toward the hill, there was little more than a yard or a yard and a half between the front wall and the bank of earth formed in digging the foundation. This bank rose as high as the eaves; so that the passage to the house was more like a deep ditch than any thing else. Nor did it want water in the bottom to complete the resemblance: when heavy rains fell, or during the melting of snows, the moisture, dripping down the side of the mountain, poured into this receptacle, and frequently entered the house, causing not only a present inconvenience by extinguishing the fire on the hearth, imprisoning children in beds, and obliging cats to embark for safety on stools or other floating furniture, but when the deluge receded, it left the earthen floor in a state of unhealthy dampness, which was never entirely removed during the driest months of the year. The discomfort was felt to be great; but the attachment to use and wont was such, that, instead of removing to a better situation when the erection of a new hovel was necessary, our excellent ancestors raised them on the same or a similar spot, and thought they had succeeded beyond measure well in devising a remedy, by leaving a conduit in the back wall through which the float-water might discharge itself. In winter these huts were often covered up with snow, so as entirely to debar egress or ingress. We have been told of a man, who, being absent during a fall of snow, found himself excluded from his own house on his return; and for a week the only communication he was able to hold with his family, was by entering an outhouse and speaking and thrusting his hand through a hole in the end wall. Two of his children lay in the same bed, ill of small-pox, at the time, and every morning the blankets above them were strewed with a layer of snow, drifted through the crannies of the crazy mansion.*

Where a dwelling was not exposed to the influx of running water, it was at least sure to admit moisture plentifully from above. The story of James Allen, the celebrated Northumberland piper, shows but too truly the condition of the thatched roofs throughout the country about the period referred to: Being asked by some gentlemen, who visited him on a wet day, while the rain was discharged in unobstructed bucketfuls about the ears of himself and family, why he did not endeavour to make his residence more habitable, by closing up the holes in the roof, he replied, "In weather like this, it is impossible to work, and when the season is fine the house does not need any repairs." Even where the roof was well kept, according to the ideas then prevalent, a long course of boisterous weather found or made numerous crevices, by which the rain penetrated. The reader is to remember, that, in the houses spoken of, nothing intervened between the floor and the roof; ceiling or "lofting" there was none; and as every chimney refused to carry off any thing but the smallest piping of smoke, that detested substance filled the cottage, first curling over the heads of the inmates, and then investing them down to the ground with its eye-vexing, "hoast-provoking" folds. On looking in by a window, after nightfall, upon a company seated round the fireside, with their slender taper dimly burning in the midst of this lurid atmosphere, their persons appeared distorted, their faces disfigured and discoloured, and they resembled a set of demons met in unholy conclave, rather than a party of worthy Scottish peasants enjoying a cheerful crack beside the winter ingle. But this was not the worst of it: the smoke crusted every beam and rafter with a thick coating of soot; and when the wet soaked through the roof, the drops blackened every thing upon which they fell. Then were called into requisition every "wecht" and broad dish in the house, which were placed all about the joists, and on the tops of the beds, to preserve the furniture, the dresses of the family, and the food they were eating, from the pollution of the sable shower. While the storm lasted, the drops pattered and plunged in the vessels, which were emptied as soon as *it was discovered* that the contents began to overflow, and a strong sooty odour was diffused into every corner of the dwelling.

Many huts of the old construction still remain to attest the truth of this description. But they are disappearing; and we would ask those who grumble on account of the increasing wretchedness of the times, whether they would propose, as a means of putting a stop to its farther progress, to discontinue the building of the neat little edifices, with walls of stone and lime, and slated roofs, which are fast rooting out these miserable dwellings from every glen-head, at least in the southern parts of Scotland?

If the immediate ancestors of our peasantry were, in point of lodging, so much worse off than their descendants, their food and clothing were equally inferior. Agriculture was in a pitiable state. There was no proper system of manuring the ground, nor of alternating crops. The fields were not sheltered by fences. Seasons were not observed with care; nor was labour regulated with any degree of precision—nothing was begun in time, nor finished in time. Sometimes servants worked extremely hard and very long hours; at others they loitered indolently about the house, wasting days in idle conversation or amusements with their master. A piece of ground was ripped up with the plough here and there on the hill-sides; the seed, most probably of indifferent quality, was flung in late; and strict injunctions were issued to the shepherd—alas, how vainly!—not to allow a single ewe to nip a single corn-stalk. When harvest came, no crop could present a more hopeless appearance; it was only half-ripe, thin, and stunted; trampled down and eaten by wild animals, as well as by those under the care of man; and the ears were switched off by the wind and weather. In this state it was cut, perhaps after the frosts and snows had set in; and, it may well be guessed, the grain was either wholly useless, or afforded food both scanty and extremely unhealthy. The consequence next season was commonly a famine and dearth; and people were driven to the most wretched means of subsistence. Butcher-meat was out of the question among the poor at that time; so nobody thought of fetching a sheep from the hill, and killing it for the use of his starving family, except perhaps he who possessed none of his own, and deemed it better to steal one than to die of hunger. Milk afforded a timely help to those who had a cow; but all such as were not so fortunate, had nothing else to depend upon but a few "lang kail," well nipt by the hares, in the corner of a fenceless garden, and wild roots, which they grubbed up in the fields. They could not plant a few early potatoes, to be coming forward as a resource before the beginning of harvest; for neither the late nor the early kind of potato had then come into common use. How would a modern admirer of past times, who never in the course of his life, except some twice or thrice by chance, missed a regular meal

* We may add that, in consequence of the coolness communicated by their snowy covering, these two children recovered with a rapidity quite unusual at the period; and this was one of the circumstances which tended to convince the people of the neighbouring district that patients suffering under that loathsome malady ought to be kept cool; it had previously been the practice, as all our readers are no doubt aware, to exclude fresh air from them with the greatest solicitude, and to heap over them loads of bedclothes sufficient to kill by suffocation even a healthy person.

like to sit down for weeks to a dish of wild herbs, unskilfully culled, badly prepared, and insufficient in quantity? Would he exchange his fine linen for "straiking" fit to rasp the skin off a tender back? would he deliver up his superfine west of England blue coat, and invest himself with one of the coarsest home-made hodden gray? or would he lay aside his neat and comfortable shoes and stockings, for the purpose of tramping it barefoot to church, and putting on a pair of the clumsiest construction on approaching the end of his journey?

So far as Scotland is concerned, this, we think, should be decisive. As to the comparative condition of the English peasantry in the past age and the present, we have not the means of drawing so accurate a contrast. It is ascertained, however, that the agricultural labourers of that country are equally well paid now as during the times of war-prices, while their employers are a great deal worse. And we have no doubt that the same change, upon the whole, as that experienced in Scotland, has taken place in the south also, though not in so amazingly short a space of time.

POWERS OF FASCINATION IN ANIMALS.

Among the most mysterious facts in nature, is the power of fascination which several classes of animals possess over others, for destructive or protective purposes. There must be few of even our juvenile readers who have not heard of this power as exerted by the rattlesnake, upon birds, squirrels, hares, and other small animals, which that serpent is in the habit of making its prey. It is said to fix its eyes upon its victim, and, opening its mouth, draws them slowly forward, trembling and fluttering with fear, but unable to restrain themselves, till they enter the yawning gulf, and are devoured. To appearance, the one creature overpowers the other by a mere exertion of the will, supposing that there is a will in animals, as we sometimes see a man of strong character draw a weaker brother into a course which ends in destruction. But this is less probable than a theory which has been formed upon observation of facts, by Major A. Gordon, of South Carolina, who, in a paper published in the New York Historical Society, attributes the fascinating powers of serpents to a vapour which they secrete, and which they throw around them to a certain distance at pleasure. Major Gordon states various facts in support of his opinion, and observes that the vapour produces a sickening and stupifying effect, and alludes to a negro, who, from a peculiar acuteness of smell, could discover a rattlesnake when in the exercise of this power, at the distance of two hundred feet, and who, following such indications, always found an animal drawn within its vortex, and struggling with its influence.

The rattlesnake, however, does not form the only class among the reptile species possessing the power of fascination. The American writers affirm that many of the larger kinds of snakes have also this power: and Vallaint, in his travels in Africa, asserts, that, at a place called Swartland, he was eye-witness to a shirke in the very process of being fascinated by a large serpent, the fiery eyes and open mouth of which it was gradually approaching with convulsive tremblings, and the most piteous shrieks of distress. Vallaint states, that the bird died before reaching the jaws which were open for it, killed either by fear or the overpowering effect of the vapour. The traveller measured the distance between them, and found it to be three and a half feet.

The sympathy which seems to exist between several of the organs of the human frame, is also as unaccountable as any of the phenomena we have now noticed. A small laceration in one of the fingers will produce a locked jaw; as, when the liver is diseased, a severe pain in the left shoulder is felt; yet why the jaw or the shoulder should be affected more than any other part of the system, still remains without any certain explanation. The effect of different poisons, when introduced into the stomach, is a farther illustration of this wonderful sympathy. The infusion of tobacco applied to any part of the alimentary canal, almost instantaneously, and apparently by some other means than the circulation of the blood, destroys the action of the heart, while the brain and the other muscles of the system are comparatively but little affected. The essential oil of almonds, and the juice of aconite, on the contrary, destroy as rapidly the action of the brain, while the heart continues nearly its usual pulsations, not only during the symptoms, but even for some minutes after death has actually taken place. Many other poisons produce a similar diversity of effect: and the poison of the horned snake, which produces death in the course of a few hours, when introduced by a wound or a bite, may be tasted and swallowed without producing any bad effect.

There are some of the natives of Africa and America who possess the power of what is called "charming," or producing a benumbing or stupifying effect on poisonous serpents and scorpions, by handling them. This power is in some natural and hereditary, while in others it is acquired by chewing the roots or other parts of certain plants, rubbing them in their hands, or bathing their bodies in water containing an infusion of them. In that part of Africa which lies northward of the great desert of Sahara, there was formerly a tribe called the Psylli, who seem to have possessed this power, either from nature or art, in a degree that occasioned the name of Psylli to be given to all persons capable of producing similar effects. Plutarch informs us that Cato, in his march through the desert, took with him a number of these Psylli to suck out the poisons from the wounds of such of his soldiers as might be bitten by the numerous serpents which infested that region. It was then ignorantly believed that this power of subduing the poison was the effect of magic, and the Psylli, to confirm this belief, always, when in the exercise of this fascination, muttered spells or chaunted verses over the person whom they were in the act of curing. Many have ventured to doubt the existence of this power being possessed by any class of people, but the concurrent testimony of the best-accredited travellers seems to confirm the fact. Mr Bruce distinctly states, from minute personal observation, that *all* the blacks in the kingdom of Sennaar are perfectly armed by nature against the bite of either scorpion or viper. They take the horned snake (there the most common, and one of the most fatal of the viper tribe) in their hands at all times, put them in their bosoms, and throw them at each other, as children do apples and balls, during which sport the serpents are seldom irritated to bite, and if they do, no mischief ensues from the wound. The Arabs of the same country, he also observes, have not by nature this protective power, but generally acquire it, by the use of certain plants. The artificial means of rendering the person invulnerable to the bite of snakes, seems also to be practised in South America. Don Pedro D'Orbies Y. Vargas, a native of Santa Fé, published in 1791 a memoir of experiments which he instituted to ascertain the truth of this phenomenon. The plant, he tells us, chiefly used by the American Indians, is called the guacomithy, from their having first observed that the bird of that name, or, as it is sometimes called, the serpent-hawk, usually sucked it before it attacked venomous serpents, which it could then do with impunity. Prepared by drinking a small portion of the juice of this plant, and innoculating themselves with it by rubbing it upon three small punctures, made in the hands, breast, and feet, Don Pedro himself, with all his domestics, were accustomed to venture into the fields, and fearlessly seize hold of the largest and most venomous serpents. It was seldom that the animal thus fascinated ever attempted to bite, or if it did, no evil consequence arose from the wound.

It may not be irrelevant here to allude to the common practice of charming trout and other fresh-water fishes, by rubbing the hands with assafœtida, and gradually approaching the fish with it, which, in an intoxication of delight, seems to abandon every degree of caution, and, instead of flying from the coming danger, advances to meet it, as a leveret to the mouth of the rattlesnake; only in the case of the fish pleasure appears to be the predominating influence.*

There is a secret influence said to be possessed by some men, by which they can disarm the rage of the most vicious quadruped. Housebreakers have sometimes been known to exercise this power over watch-dogs; the animal, while the robbery is committing, seemingly being under an influence of a quieting and sedative kind. The natives of Lapland and Dalame, it is affirmed, are in the possession of this secret generally, insomuch that they can oblige the most furious dog to fly from them with all his usual signs of fear, such as dropping his tail and suddenly becoming silent. The power possessed by "Sullivan the Whisperer" over horses (described in a late number of the Journal) is also illustrative of this subject. Thus we see an effect of the most powerful kind produced by one animal upon another, without being able to trace the medium of operation by which the consequences are made visible. The only mode by which this mysterious control can in any way be accounted for, is that adopted by Major A. Gordon, of which we have already spoken, viz., that, either by an inherent or acquired power, the controlling animal is enabled to emanate the absorbing influence which thus subdues or stupifies its victims.

* Among the instances of a fascinating or sympathetic power in other departments of nature, the most remarkable perhaps is that presented by the valisneria, an aquatic plant belonging to that order in which the male and female are classed separately. The male has a long spiral stem, by which its flowers are enabled to adapt themselves to the water, from the bottom of which the plants shoot forth, and to float in the middle of tide-streams of every variety of ascent. The stem of the female is shorter; and this species of the plant is only found in shallow water, or on shores where the tide exerts but little influence. As soon as the male flower has become perfected, the spiral stem dies away, and the flower separating itself from it, floats with the stream or wind over the water; until, at a certain distance from the spot occupied by the female flower, it is attracted with an influence so strong as to oppose with success the power of the stream or wind, which otherwise would carry it in a different direction. From whence this phenomenon arises, is altogether unknown; the most plausible cause ascribed, is, that the attraction is produced by a peculiarity of odour, which, though unknown, these plants may inherit.

Among fishes, several of them have powers of exercising upon their enemies a fascination, which enables them not only to escape from the threatened danger, but also gives them a facility of securing the animals, which they in their turn destine for their prey. The torpedo ray has the power of throwing a benumbing sensation upon the arm of the fisherman, through the hook, the line, and rod, which he is using; and, what is still more extraordinary, the fish has the power either of inflicting or withholding the shock which thus disarms his enemy. This animal is frequently found on the wet sands after the tide has retired; he buries himself in it by means of his fins, which serve to throw the sand over him; and even when hidden in this manner, he is said to have the power of striking with sudden torpor the casual wayfarer who may be passing over him.

THE GENTEEL YOUNG MAN,

A TALE.

William Frederick Cook was an exceedingly genteel good-looking young man, about twenty years of age, the son of a tradesman in London, who had an idea he should make his boy something above wearing an apron and sleeves, by sending him to schools at which the classics were taught. Accordingly, when Master William's education was finished, or, more properly speaking, when the expenses could no longer conveniently be endured, he came home, and, considering himself a miracle of learning and gentility, strutted, spouted Latin, thought his father was a fool, consulted his mirror like some of the other sex, who think fortunes may be made by face and figure, became a regular cultivator of whiskers, and spurs, and, consequently, a gentleman.

He was occasionally at places of amusement, but regularly in the family pew at St George's, and was considered a youth good as he was handsome, till it was discovered that he was thus regular in his attendance at church to eye the daughter of a gentleman of fortune, who as constantly was seen in her family pew on the opposite side of the aisle. Every Sunday, an ocular correspondence was kept up between this pair, till, tired of mere vision, they met, spoke, and were in ecstacies with each other. Young Mr Cook was determined to make the most of this promising adventure. He was penniless, had no profession wherewith to support himself, no species of patrimony to look for—nothing, in short, to depend on but his whiskers, his spurs, his gentility, and his beautiful fine-sounding name. This, therefore, was a capital chance of entrapping a young lady with what are called "good expectations"—a chance not to be lost sight of. Miss Louisa Heaviside, at the same time, could think of nothing but William Frederick Cook, because he was such a very handsome young man, and had such a very pretty double Christian name. She believed that marriages were made in heaven—that it would be the height of human felicity if she could be so fortunate as to secure such an elegant young gentleman as her husband. She was about eighteen, and somewhat romantic—considered manly beauty the first and only requisite in a husband—therefore, to such a man there could be no possible objection. She was confident they loved each other; therefore every one should strive to produce a union fraught with such an enviable share of happiness.

Her parents, however, entertained opinions not in agreement with these joyous notions. They ascertained who this William Frederick Cook was, his disposition, and his prospects in life. They then represented the impropriety of such a connection, but without effect. Louisa said, Mr William Frederick Cook was a scholar, and an elegant and a handsome young man. Her determination to speak enthusiastically of him, and his resolution to write in the most impassioned style to her, induced her parents to send her on a distant visit, by way of what is called putting a girl out of harm's way; and so cautiously were the movements made, that young Mr Cook could not discover when or whither his dear Louisa had been dispatched. In a state of anxiety and hopelessness, he began to think his fair prospect blighted. He bribed all Mr Heaviside's servants without obtaining the least information. He sought at every place where post-horses could have been engaged; but he could obtain no tidings to cast one ray of hope on his despair.

Louisa had been conveyed to Chichester, in Sussex, and there placed under the care of an uncle and aunt, till her frenzy should have subsided. They were attentive to their charge, and tried the soothing, the reasoning, and the threatening modes, without success. Louisa was inconsolable and sullen. She thought that "fathers have flinty hearts"—that all the promised ages of bliss were lost. It was certain to bring her to an early tomb.

In the depth of this despair, Love, all-powerful Love, lent Louisa his aid. Her servant's heart he softened. A feather, plucked from a quarter of a hundred of quills, at six shillings the hundred, spread, in Scott's liquid black, certain feeling hieroglyphics, swollen with tears, all over a sheet of gilt-edged post, and the mail-bag conveyed the dear epistle with such correctness, that the sad William Frederick started at once into consciousness of existence. Swift as the stage-coach could waft him, and the girl Hannah could arrange it, he was saluting his Louisa's tear-wet cheek. This was like magic! Raised from despair to joys unutterable, in despite of counteract-

ing magicians, in the shapes of aunts, servants, locks, keys, and bolts! Love truly laughs at locksmiths.

By the help of Hannah, meetings, happy and delightful because forbidden, continued undetected. What blissful days! All was charming—too flattering sweet to be substantial. Louisa's aunt was not a young lady; and although years might have taken away her good looks, she kept a good look-out, and, putting her finger to her nose, cogitated on the sudden change in Louisa's manner. To go so frequently a-shopping alone—to stay from home so much longer than necessary—to dislike interrogatories, and yet be cheerful! All this was not exactly according to the strict principles of moral sentiment. Suspicion in an aunt presently becomes accusation. Aunts in authority endure no restraint: they are of course despots. Power, on being replied to unsubserviently, feels angry, and vindictive people despise argument when they can apply force. Louisa was contumacious, and in consequence endured close confinement. This was a shock that shattered the nerves of both lovers: their hearts were rent in twain: every string was severed.

Hannah, however, was still the mediator. She wafted the sighs to the miserable Mr Cook, and he wrote nonsense verses—not in Latin, though he could do either equally well. One truth he never forgot to state—he could not live without her. How full of truth and feeling was this declaration! If the world were one vast chrysolite, and hers, she would give it for him, most enchanting man! In another sense, the declaration was quite true; for Mr Cook had in reality lived for some time upon subsidies raised from the resources of his mistress, and, besides her fortune, had no means of livelihood in the world.

All this amiable young adventurer's hopes of turning the speculation to a good account, now revived. He brushed up his whiskers and his Eton grammar, in proof that he was a man of refinement. But happiness is not to be taken by storm. The aunt, the unfeeling aunt, was ever on the alert. The holding of a correspondence with a captive, in spite of the governess who held the keys of the citadel, was provoking to the last degree. Determined to put a stop to this intercourse, she renewed her vigilance, and at length observed Hannah more than particularly busy one morning with something like a letter. The aunt hastened to the apartment of Louisa, whom she found singing

"For tenderness formed."

Without ceremony, the aunt closed the door, and waited like a tigress to spring upon her prey. Hannah unsuspectingly opened the door, saying, "Here's the letter, miss." The aunt caught it from the out-stretched hand, and, in contempt of the post-office denunciations, broke open the seal, and read all she could. The old lady looked perfectly petrifying: Louisa sunk back in her chair; and Hannah vanished. The aunt left the chamber, slamming the door after her so violently, that the windows rattled. Every one in the house rushed to the stairs, and heard that Hannah's boxes were to be examined instantly, her wages paid, and she forthwith bundled out of the house. Searching at the custom-house wharves is a mere glance, compared with this examination. Three sovereigns were found in a little box, and one of them had a mark, which the aunt recognised as that identical sovereign she received in change when she paid her grocer's bill, and which had been paid to Louisa, with others, for pocket-money. How clear that these were the rewards of perfidy! How could the officers of justice be directed to proceed? "Why," replied the uncle, "neither be angry, nor talk nonsense; if you disapprove of Louisa's conduct, send her back to her father, and do not let the tranquillity of my house be disturbed by such vagaries." This was determined to be carried into effect as soon as possible; and the aunt insisted that Hannah should be sent off instantly, which was accordingly done.

The uncle, on investigation, perceived great perseverance in his niece's correspondent; he disliked being her jailor, seeing the impossibility of fulfilling the duties, and he determined on seeing the genteel young man at the inn where he had taken up his quarters, in opposition to the advice of his lady, who thought a very different treatment proper for such an impertinent fellow. The uncle having called on Mr Cook, saw him a youth of fine features, good figure, and of prepossessing manners; and in the course of conversation, felt himself somewhat in the back-ground, while quotations from the examples in the Eton grammar were interspersed without rhyme or reason, to all of which the old gentleman could only umph, and wish himself well out of the house. He learned, however, that William Frederick Cook was resolved to love Louisa eternally, and so took his leave very much dissatisfied with his visit. He now wrote to Louisa's father, explaining all the particulars; gave her twenty pounds, and saw her with her bandboxes placed in the coach for London, stating to the coachman that he should see the young lady safely delivered as directed.

But Mr Cook was not to be baffled. By spies in the house, he knew all the movements of the family, and took proceedings accordingly. He joined Louisa on the road, having previously taken his place, and they concerted measures by which to prevent others from thwarting or interfering with their happiness.

It was long before the hurricane had subsided in the aunt's mind, every circumstance being in a course of aggravated repetition. What had Louisa done with the money that had found its way to her?—and then she enumerated several sums presented to her by wealthy relatives. Why, as she lived, they amounted to eighty-four pounds six shillings and sixpence. Astonishing! And upon this came the astounding fact, that her uncle had given her twenty more at her departure! making one hundred and four pounds six shillings and sixpence!—her voice gradually increasing in shrillness as she repeated the enormous amount. All of which was to be lavished on that sneaking villain! Perhaps it went to pay his extravagance at the Black Lion. Oh! he was a precious swindler, certainly: Louisa would make a fine affair of it. He would soon be sick of her, a silly love-sick stupid girl. She was heartily glad to have wiped her hands of such impertinent misses. Girls now were not what they used to be. One hundred and four pounds six shillings and sixpence in about a month! Such a mean rascal.

Cash to this amount, as appeared in the aunt's memorandum book, had been disposed of as suspected; for Louisa valued nothing but as it might contribute to the enjoyments of her dear William Frederick, and had left her purse without a coin, till the fortunate supply by her uncle.

During a month, occupied in sighing and dying, as Louisa thought, Mr William Frederick Cook had lived like a prince at the Black Lion, enjoying all the rural sports of the season, and often as drunk with wine as with love. His attachment, indeed, was of the most heartless description; and though he must have been more or less than man to have altogether contemned the affection which his mistress displayed for him, he certainly was much more interested in her fortune, or at least to the means which she furnished for supplying him with the paltry indulgences in which he delighted.

They were overjoyed at meeting on the road. The licence and the ring, which had often been spoken of and written about, were now exhibited, and proposed to be brought into action. An opportunity soon occurred such as might never again be presented. It was considered unwise not to take advantage of the moment. Accordingly, by a little artifice, such as is ever resorted to when any thing clandestine is to be executed, the genteel William Frederick Cook and Miss Louisa Heaviside were indissolubly married, at St George's Church, without the knowledge of any part of the young lady's family, although residing in the parish. The festivities on the occasion were kept at the house of old Mr Cook, who saw in this union the fulfilment of his hopes in the advancement of his son. The new-married pair were supplied from his diminishing funds, willingly, because there could be no doubt of a reconciliation with Louisa's family in a short time, and then all would go well on the road to prosperity. But to produce this was an undertaking surrounded by difficulties. To express penitence for a wilful act, by which the perpetrator might alone be benefited, required a greater share of impudence than Mr William Frederick could muster. In this case, Louisa wrote, though not after the genuine dictates of her own simple heart, with diffidence, or submission, or hope of forgiveness; but merely an announcement of their intention to call on their return to town.

Before the expiration of many weeks, the happy pair paid their visit of ceremony to Louisa's father and mother. To meet with unkindness had not occurred to the tutored mind of Mr Cook, although it had been suggested as possible to the sensitive Louisa. They experienced the rebuke and the contempt of a haughty man, who found his intentions thwarted by a designing and heartless villain. They heard the cold expressions of astonishment at their presuming to appear where they had offered such insult. At this expression, the elegant young husband ventured to express his claim to the character of a gentleman, whom Louisa had considered herself justified in selecting as her husband, and said that neither had to regret what had occurred. Unfortunately this partook more of rudeness than propriety. Louisa's mother and sister left the room with all the signals of insulted dignity, and with a parting glance of contempt. Mr Heaviside inquired of Mr Cook the means by which he intended to meet the expenditure resulting from his marriage. This was a trying question for a genteel young man without a profession; he replied, "that he was a scholar," and made up the rest by a string of Latin quotations. "Young man," interrupted Mr Heaviside, "either you cannot express yourself in your native tongue, or you wish to make some impression on my mind, by your smattering knowledge of the classics. If you knew how contemptible you appear, your lower-form absurdities would be expunged from your memory. I know you well." "Sir," replied the high-spirited William Frederick Cook, "you know, then, that I am not solicitous to obtain the pity of any one." "Go, rash man," said Mr Heaviside, "for you are worse than a beggar, and never let me see you more."

Silent and slowly they left the house, the door of which never opened again to receive them. They both secretly felt how much they had transgressed, and that they were driven on the world nearly destitute. Yet they endeavoured to excite in each other the hope that shortly a reconciliation would restore them to what they deemed their just expectations, and then every debt would be paid, and they should yet be happy. Idle dreams! The pride of appearance sustained them under many privations; but the world, that looked on with an affected smile of commiseration during their distress, finding there was no thought of honest industry, looked coolly upon them, and pity was soon superseded by just contempt.

This infatuated pair subsequently passed a period of wretchedness in a village within a few miles of London, occasionally supplied by Louisa's uncle with small sums to extricate them from pressing emergencies. Mr Heaviside and his family departed from England, and in a short time he died, without the name of his undutiful daughter being mentioned in his will. This was a death-blow to all the hopes of these miserable victims of passion on the one hand, and evil designs on the other. The relations of both had now been completely wearied out with their applications, and declared their resolution to afford no further assistance, be the consequences what they might. As for the elder Mr Cook, he was already drained of every shilling he possessed. After this, the husband of the deluded Louisa proved, by his idleness and his debauched habits, that he was one of the most worthless of beings. The poor forlorn wife at last discovered how egregious had been her folly in trusting to mere external appearances in her choice of a husband, and in making that selection without the approval of those seniors who were better able to judge, and had a right to do so from their interest in her fate. Fortunately she was not doomed to linger out a painful existence. In giving birth to an infant in a miserable apartment in the village in which she and her husband had taken up their abode, the want of attention, of comfort of any kind, and even of the necessaries of life, terminated at once her existence and her miseries. As for the monster who had thus blighted the prospects of a tender and confiding female, he soon after was compelled to flee from his country in dread of the vengeance of its outraged laws.

The moral of this too true tale is, that young ladies should beware of forming engagements with genteel-looking young men hanging loose upon society, who do not become acquainted with them in a regular manner, and whose addresses do not meet with the approbation of their parents. In the case of a young lady of fortune, or with "good expectations," this danger is to be especially avoided, for those contingencies render it impossible for her to discover whether she is the object of a real attachment, or only the means contemplated for enriching a needy and perhaps unprincipled adventurer. The state of public feeling on this subject is not what it should be. Whether from the erroneous colouring too often given to it in works of fiction, or from a natural pleasure in seeing those above us degraded to an inferior station, many persons like very well to hear of a penniless young man having been successful in forming a clandestine alliance with a young lady either possessed of or with prospects of fortune. *Our* sympathies, we must confess, go all the other way. We conceive, that, to practise on the affections of an ignorant and inexperienced female, and induce her to do that which will bring pain and humiliation into the whole circle of her connections, is no honourable way of bettering one's self in life—that, on the contrary, he who injures his neighbour in this manner, is only restrained by the law from injuring him in some other way, less severe perhaps to the injured, though not so safe to the injurer. Marriages, to be happy, must be nearly equal—equal alike in the fortunes of the individuals, and in their ages, tempers, and other personal qualities; and it can certainly never be good for either party that this rule is infringed in any respect. We, therefore, consider every youth who deliberately inveigles a woman of superior rank into matrimony as simply a prudent kind of rogue, who seeks for advantages to himself, at the risk of misery to the person chiefly concerned, and at the expense of wounded feelings and a certain kind of degradation to all connected with her.

SCRAPS FROM ANTIQUITY.

By William Tennant, Esq. Author of "Anster Fair."

EGYPTIAN LAWS.

The Egyptians, a wise people, to whom Europe is indebted for the best of her institutions, had some singular laws, peculiar, indeed, to themselves, but founded on the deepest reflection and happiest views of state policy. Every man of the Egyptians was ordered to give in to the magistrate to whose authority he was subjected, an account of the ways and means whereby he derived a livelihood, and maintained himself alone, or himself and family together; and the punishment of death was considered due to him who either falsified his return, or refused it. Solon, who travelled into Egypt for the sake of deriving wisdom from conversing with her wise men, transferred this law to Athens. It would appear, that, by the laws of Egypt, ignominious bodily labour was substituted in many cases for the severer punishment of death. One of their kings, by name Sabaco, recommended this substitution, seeing that, by the labour of the condemned culprit, advantage was derived to the state; whereas death not only was too severe, in most cases, for the frail peccabilities of mankind, but was utterly barren of utility, as well to the public as to the individual—a reflection highly honourable to the monarch of Thebes, and worthy of being acted upon by all the legislators of Europe. Herodotus says, that condemned persons in Egypt seldom if ever suffered death, but were allowed to live, subjected, however, to severe bodily labour in the public works; and that

the mounds or artificials eminences, wherever, for the sake of protection from the inundations of the Nile, their cities were built, were the production of the labour of the criminals thus beneficially employed. The laws of another king, by name Boccharis, regarding debts and money transactions, are likewise founded on great good sense. Persons borrowing money, or sued as having borrowed money from others, without the accusing party having bond, bill, or recognition to prove the debt, are acquitted from it, on their giving their oaths they owe nothing.—[This enactment, we believe, has been transferred to every country.]—Of those, however, who were truly debtors, the creditor had it in his power to attach and distrain *the goods only;* his person was considered as sacred to the state, pledged, in common with his countrymen, for its defence and protection; therefore was secure, or ought to be secure, from the violations of an irritated creditor.

MICE.

Mice seem to have been regarded with some sort of superstitious reverence by the ancient people of the earth. In the Egyptian hierography, the figure of a mouse was understood to typify some unexpected and complete destruction by divine interposition. Apollo in Crete and the Troad, had the name of Smintheus, as being the patronising deity of these gentle animals, to whom he was supposed to have communicated some of his own talent of divination, so that they are enabled to foresee the destruction of the tenement in which they may happen to be lodged, and to make their escape in good time ere the tenement tumble—a faculty which we have transferred, less classically, to rats, a more unamiable and unpopular quadruped. Mice have obtained celebrity by being prominent agents in three transactions—two of profane, the third of divine history. Ashdod, in consequence of the captivity of the ark, was smitten with multitudes of mice; as a trespass-offering to remove which, five golden mice were presented to the judges of Israel by the lords of Philistia. Sennacherib's army, when on the point of invading Egypt, was, according to Herodotus, assailed by a countless army of these animals, who, by devouring their bowstrings, shield-straps, baggage, &c. foiled the invader, and incapacitated him for completing his object. On another later occasion, when a colony of the Teneri issued from Crete in quest of settlements in Asia Minor, they were encouraged and authorised, by an oracular response, to make their abode in that place, where the *earth-born*, or Indigenes, should emerge from their dens, and make an assault upon them. This happened to them near Amaxitus, a town of the Troad, where, as they lay encamped during the night-time, a countless host of field-mice emerged, swarming from underground, and began to nibble away the leathern part of their armour, their baggage, and eatables. Considering these *indigenous* creatures as the fulfilment of the oracle, they settled there; and erected a temple in Chrysa to Apollo Smintheus, or Apollo of the Mouse, with a statue of the god, appropriately having a figure of a mouse under his foot. Some geographers have thought that the country called Mysia had its name from this circumstance of the mouse.

DIOGENES.

Diogenes, surnamed the Dog, or the Cynic, was a native of Sinope, but lived for the greatest part of his life at Athens, where his usual domicile was a tub, or large hogshead, where he slept at night, and hovelled during the morning and evening, much to the amusement of the Athenian boys, who sometimes pelted at and broke down his wooden dormitory with stones. In every thing this man studied eccentricity—in his dress and doctrine, as well as his domicile. He went about with his scrip and staff as a mendicant, at the same time that he gave public lectures on the most abstruse and sublime themes of philosophy to the enlightened citizens of Athens. He wrote some tragedies, and many philosophical treatises, all of which are lost; so that nothing now remains of him but *his sayings*, which are quite enough to prove him to have been one of the most original, sarcastic, and powerful minds of antiquity. He excited the laughter of the Athenians, much to the prejudice of Plato his rival, by producing on the floor of his lecture-room a cock, denuded of wings and feathers, as an appropriate exemplification of the unfortunate definition of Cato, who had styled a man a *biped without wings*. "Behold," said he, to his amused audience, "here is Plato's man!" His rival was so ashamed that he corrected or retracted his definition. The eccentric sage of Sinope was wont to embrace in winter statues coated with ice and snow, to accustom himself, he said, to hardihood: for the same reason, he placed himself under roof-spouts in heavy rains, to benefit his constitution with an effectual cold bath. He, in his half-serious, half-jocular mendicating strolls, supplicated, sometimes, not for money, but for golden and brazen statues, that he might accustom himself to a refusal; from any avaricious person he happened to meet, he solicited as an alms no less than a *mina* (L.3, 15s.), saying, that he begged and got smaller sums from generous persons, who gave to him often, but from misers, who gave but once, he would take no less a sum than he had mentioned. When asked how he wished to be buried—"With my face downward," he replied; "for in a little while every thing in this world will be turned upside-down." When invited by some person to supper, he said he would not go, as last time he went the inviter was not sufficiently grateful for it. During his life, his reputation for strength of character and genius was such as to induce the victorious son of Philip to pay him a visit in his tub. The Macedonian introduced himself to him as the son of Philip, and king of Macedonia. The philosopher announced himself very simply as being but Diogenes the Dog. So strongly was Alexander impressed with the originality of his mental qualifications, that he left him with the extraordinary expression, that, were he not Alexander, he would fain be Diogenes. It is recorded that he died on the same day at Corinth with the Persian conqueror at Babylon.

THE SETTLERS OF THE WEST.

The season for emigration is now some time past: the snows of winter now lie many feet in depth on most of the lands in Canada, and other northern portions of America. The great rivers and canals, which afford a ready communication with the country in the interior, are now frozen over with thick ice; and the settler and his family now sit around their wood fires in their log-huts and cabins, enjoying the plenteous though rude fare of the western wilderness and its clearings, or merrily drive along the hard surface of the snow in their carioles or sleighs. In this country, the nipping frosts, or plashing sleets and rains, so common at the close of the year, keep the hardy peasantry and working classes within doors at divers employments, and afford a period of relaxation, during which they may ruminate on their condition and prospects. Of all the seasons of the year, the present is the best suited for this species of meditation. Every man who depends for subsistence on the labour of his hands, and who has a difficulty in finding employment, should now, therefore, reflect on the advantages which might arise by removing to a much more extensive scene of exertion on the return of spring. To emigrate, is obviously the only course to be pursued by the many thousands of families in this country who are now straitened in their circumstances, yet have the power, as well as the inclination, to better their condition by moral and physical exertion. The time has long since come, when an over-abundant and impoverished population should feel it incumbent to take advantage of this ready and valuable means of relief from their urgent necessities. We again most earnestly press upon the labouring population of Great Britain the consideration of this to them important subject. Almost every day brings forth a body of new and useful facts regarding the increasing comforts of those who have already chosen to emigrate to countries suited for their settlement. Where those countries are, we have from time to time pointed out in general terms. The more that we hear or read of the nature and condition of the countries beyond the Atlantic, the more are we convinced that they hold out the bounteous offer of a place of comfortable settlement for all classes of persons who are willing to go thither, with a desire to succeed by the efforts of patient industry; and the more are we convinced of the folly of persons in destitute circumstances, though with the means of removal, remaining longer in Great Britain. Placing out of view the Canadas, and other British possessions, and also passing over those states in the Union which border on the Atlantic, there are extensive regions in the interior, admirably suited for receiving any number of settlers, no matter how many should go. Let a poor labouring man in this country, for instance, weigh in his mind what we are now going to tell him. Beyond the range of huge hills, called the Alleghany Mountains, in the United States, there lies an immense inner country larger than all Europe, and consisting of the finest land in the known world. In this extensive territory, there are *prairies*, or meadow lands, stretching for a thousand miles in length, by some hundreds of miles in breadth, covered with the most luxuriant herbage for pasturing cattle, and so thinly inhabited, so little occupied by settlers, that if all the people in this country were to emigrate thither, they would hardly be seen. Such is also the demand for labourers in this vast region, that if all the poor and all the labourers out of work in England, Scotland, and Ireland, were to proceed thither, and offer themselves as servants of one kind or another, they would every one of them be certain to get employment, and at wages far higher than they could possibly procure at home. And, what is more, if they had families of children growing up to be useful, they would be better off still. Let the labouring man, or mechanic, who is wearing down with vexation and poverty in this country, reflect coolly on the extraordinary advantages thus to be procured by emigration to the western states of North America.

The vast region beyond the Alleghany Mountains, through which flow the Mississippi, the Ohio, the Missouri, the Arkansas, and many other large rivers, with hundreds of a lesser size, is divided into separate states, each of which is as large as England or Scotland, if not some of them larger than the whole United Kingdom put together. The principal of these western territories are named Ohio, Indiana, Illinois, Michigan, Missouri, Kentucky, Tennessee, Louisiana, Mississippi, and Alabama, all of which will successively engage our attention.* Into these large and fine districts are now poured the various tides of emigration from different points of the eastern or Atlantic states, some proceeding from Pennsylvania, by way of the Pennsylvania canal, towards Pittsburg on the Ohio, by which they sail in different routes; some proceeding from the Canadian frontier by way of Sandusky on Lake Erie, whence there is a canal or other species of communication to the Ohio; and others proceeding by way of New Orleans on the south, and sailing in steamboats on the Mississippi towards the various points of location in the interior. From the east, the north, and the south, innumerable crowds of emigrants, in boats, waggons, and on foot, are pressing continually forward, and filling up by slow degrees the immense territories of the west. Such indeed is the spirit of adventure and desire of settlement in the rich remote lands of the Union, that lately a thousand persons were to meet at St Louis, on the Mississippi, to form a company to cross the Rocky Mountains on the west, with a view to select locations on the slope towards the Pacific Ocean.

Whether approaching the interior by way of the Pennsylvania canal, or by Lake Erie from New York, emigrants very frequently make Pittsburg a main centring point. Pittsburg is a large flourishing town on the Ohio, celebrated for the extent of its trade and manufactures, and a place at which emigrants determine on their subsequent route. If bound to Indiana, Illinois, or Missouri, they either purchase a family boat, and float down the Ohio under their own guidance, or take their passage in a steam-vessel. The voyage down this large river is described as remarkably pleasant. While the emigrant from the south finds the autumnal and vernal season on the Ohio too cool, to the northerner it is temperate and delightful. When the first wreaths of morning mist are rolled away from the stream by the bright sun, disclosing the ancient woods, the hoary bluffs, and the graceful curves and windings of the long line of channel above and below, the rich alluvial belt, and the fine orchards on its shores, the descending voyagers must be destitute of the common perceptions of the beautiful, if they do not enjoy their voyage, and find the Ohio to be what the French called it, La Belle Riviere—the fine river.

After the emigrants have arrived at Cincinnati, another flourishing town on the Ohio, or at some other spot where they had anticipated to fix themselves, a preliminary difficulty is the determination to what quarter to repair. All the towns swarm with speculating companies and land agents; and the chance is, that the first inquiries for information in this perplexity will be addressed to them, or to persons who have a common understanding and interest with them. One advises to the Wabash, and points on the map to the rich lands, fine mill seats, navigable streams, and growing towns, in their vicinity. Another presents a still more alluring picture of the lands in some part of Illinois, Missouri, the region west of the lakes, and the lead mines. Another tempts him with White River, Arkansas, Red River, Opelousas, and Attakapas, the rich crops of cotton and sugar, and the escape from winter which they offer. In Cincinnati, more than in any other town, there are generally precursors from all points of the compass, to select lands for companies that are to follow.

When this slow and perplexing process of balancing, comparing, and fluctuating between the choice of rivers, districts, climates, and advantages, is fixed, after determination has vibrated backwards and forwards according to the persuasion and eloquence of the last adviser, until the purpose of the immigrant is rendered firm, the northern settler is generally borne to the point of debarkation nearest his selected spot by water, there being plenty of steam-boats proceeding in every required direction for his use. He thence hires the transport of his family and moveables to the spot, though not a few move all the distance in waggons, which process gives them an opportunity of selecting a location as they pass along. The whole, however, drop in noiseless quietness into their position, and the rapidity of their progress in clearing and settling a country, and covering it with towns, villages, and farm-houses, is only ascertained by the startling results of the census.

The southern settlers who immigrate to Missouri, and the country north-west of the Mississippi, by their show of waggons, flocks, and numbers, create observation, and are counted quite as numerous as they are. Ten waggons are often seen in company. It is a fair allowance, that a hundred cattle, besides swine, horses, and sheep, and six negroes, accompany each—the train, with the tinkling of a hundred bells, and the negroes wearing the delighted expression of a holiday suspension from labour in their countenances, forming one group, and the family moving slowly forward, forming another. As the cavalcade is seen advancing along the plains, it presents a pleasing and picturesque spectacle. The parties always make arrangements at night-fall to halt at a spring where there is wood and water, and a green sward for encampment. The dogs raise their accustomed domes-

* The statistical facts to be brought forward in these proposed papers will be drawn chiefly from Timothy Flint's Geography of the Mississippi Valley, an American work of great value, and to which we have been indebted for a portion of the above article.

tic baying. The teams are unharnessed, and the cattle and horses turned loose into the grass. The blacks are busy in spreading the cheerful table in the wilderness, and preparing the supper to which appetite and fatigue give a zest. They talk over the incidents of the past day, and anticipate those of the morrow. If wolves and owls are heard in the distance, these desert sounds serve to render the contrast of their society and security more sensible: their caravans do not, as in the case of those which traverse the African or Asiatic continent, dread the incursion of barbarian robbers, or the exactions of petty savage princes. They alike proceed and lie down in peace and security, every day plunging deeper and deeper into the forest or prairie, until they have found their place of rest.

The position for a cabin generally selected by the western settlers, is a gentle eminence near a spring, or what is called a *branch*, central to a spacious tract of fertile land. Such spots are frequently occupied by tulip and black walnut trees, intermixed with the most striking flowering shrubs of the western forest. Springs burst forth in the intervals between the high and low grounds. The brilliant red-bird, seen flitting among the shrubs, or perched on a tree, seems, with its mellow whistle, welcoming the strangers to their new abode. Flocks of paroquets are glittering among the trees, and gray squirrels are skipping from branch to branch. The chanticleer rings his echoing note among the woods, and the various domestic sounds produce a strange effect, as heard in the vicinity of these remote settlements. Pleasing reflections and happy associations are naturally connected with the contemplation of these beginnings of social life in the western wilderness.

In the midst of these solitary and primeval scenes, the patient and laborious father fixes his family. In a few days a comfortable cabin and outbuildings are erected, and a rude process of agriculture is begun to be exerted. The first year gives a plentiful crop of Indian corn, and common and sweet potatoes, melons, squashes, turnips, and other garden vegetables. The next year a field of wheat is added, and lines of thrifty apple-trees show among the deadened remains of the forest. If the immigrant possess any touch of horticultural taste, the finer kinds of pear, plum, cherry, peach, nectarine, and apricot trees, are found in the garden. Thus do improvements advance. In ten years, the original log-buildings will all have disappeared; the shrub and the forest-trees will be entirely gone. The Arcadian aspect of humble and retired abundance and comfort will have given place to a brick house, or a planted frame-house, with fences and outbuildings very like those that surround the farm-steadings in the olden countries.

It is a wise arrangement of Nature, that different minds are endowed with different tastes and predilections, that lead some to choose the town, others manufactures, and the village callings. It seems to us that no condition, in itself considered, promises more comfort, tends more to virtue and independence, than that of these yeomen of the western states of America, with their numerous, healthy, and happy children about them—with the ample abundance of their granaries—their habitations surrounded by orchards, the branches of which must be propped up to sustain their burden of fruit, beside their beautiful streams and cool beech woods, and the prospect of settling each of their children on similar farms directly around them. Their manners may have something of the roughness imparted by living in solitude among the trees; but it is kindly, hospitable, frank, and associated with traits, which, however liable to be ridiculed by those who travel to find fault, constitute the stability of the commonwealth. We apprehend such farmers would hardly be willing to exchange this plenty, and this range of their simple domains, their well-filled storehouses, and their droves of domestic animals, for any mode of life that a town can offer.

No order of things presents so palpable a view of the advancement of American institutions, as that which we thus faintly describe. The greater proportion of these immigrants, besides their wives, a few benches and chairs, a Bible, and a gun, commenced with little more than their hands. Their education, for the most part, extended no farther than a knowledge of reading and writing, and their aspirations had never strayed beyond the desire of conducting a farm. But a sense of relative consequence is fostered by their growing possessions, and by perceiving towns, counties, offices, and candidates, springing up around them. One becomes a justice of peace, another a county judge, and another a member of the legislative assembly. Each one assumes some municipal function, pertaining to schools, the settlement of a minister, the making of roads and bridges, and the execution of public works. A sense of responsibility to public opinion, self-respect, and a due estimation of character and correct deportment, are the consequences.

Such is the general condition and character of those adventurous settlers, who are now in the course of peopling the wide-spread prairies and forest clearings of the remote territories of the Union. In succeeding numbers, we shall endeavour to describe each individual state, its extent, local character, and applicability to the wants of emigrants, in order that a perfect idea may be obtained by the poor man of this great western world, prior to the annual period of emigration from this country.

GOOD ACTIONS.

VERY vague ideas obtain about good actions, and the praise due to them. To a common mind, the half sovereign bestowed by the king upon a lame sailor, and the halfpenny given to an ordinary object of charity by some person little richer than himself; the money given through the impulse of humane feeling, and that which is tossed away to escape importunity, are the same thing. Nor does it matter whether a man dispenses from what he has fairly won and rightfully possesses, or only gives that which is more properly due to his creditors. The world in general sees only the *act of giving*; takes little consideration of the proportion between what is given and what remains; and hardly ever becomes acquainted with any of those circumstances in the giver, which so often, in the estimation of those who know him better, cause his beneficence to assume a foolish or a guilty aspect.

In reality, a so-called good action is only so under certain circumstances, all of which must be carefully considered before the deed becomes justly entitled to praise. We must first, above all things, know how much self-denial the individual had to exercise, before he could honestly do this action. If the good consisted in a dispensing of money, we must discover how much temptation he had to spend it upon his own gratification—of what value the sum was to a man in his circumstances. If the good deed consisted in the performance of some kind office, which cost trouble and time, we must ascertain the value of time to that individual, and the temptation he was under to confine his energies to his own business. If a man only gives away that which he could hardly be the better of keeping, or engages himself in humane offices which are rather an amusement to him than a cumber, then we can see little title he has to praise, except upon the score that he *is not* a miser when he *might* have been one, and has the good taste to prefer a beneficial to an useless kind of recreation. On this principle, a great discount must be made from the trumpeted bounties of very wealthy men and others—though not perhaps such a discount as some would be inclined to demand. An income may be large, but it can hardly be so much so as completely to transcend the capabilities of man to use it in a great measure upon his own gratifications. It matters not whether we take the weekly pound of the artizan, or the daily thousand of certain British grandees. The appetites, tastes, and habits of men are such, that a gratifying use may be found in every shilling of the money in both cases; and neither political economy nor instinctive justice can say any thing to the contrary. It is to be said, however, that of the larger class of incomes, a great deal must be spent upon luxuries—things not pressingly needed—things which a good mind may be easily content to want, in order to obtain a greater gratification for a fellow-creature. As we ascend, therefore, higher and higher into the scale of incomes, we always find the more ample means of sparing for beneficent purposes, and the less self-denial required for enabling an individual to give. Hence, if one man be justly considered charitable, who gives away the fortieth part of an income of forty pounds a-year, a tenth part of an income of forty thousand would hardly entitle the possessor to the same reputation. The former gives where he is tempted to purchase necessaries; the latter where he hardly knows what necessaries are. The former gives, with the assurance before his eyes that the time is very likely to come when he might wish he had retained; the latter gives from a store which he is confident will always afford him the comforts of life. In fact, he who gives from an income above a competency, has no merit in his benefactions, except that, since he can only spend the superfluity upon luxuries of one kind or another, he approves himself to be a person of good heart and right mind if he prefers "the luxury of doing good" to certain others somewhat less rational.

In estimating an apparently good action, we must also take into account how far it is likely that the performer draws upon his own resources, gives the result of his own toil, and renounces what he could honestly convert to his own gratification. There are some people who are amazingly generous with other people's money. We could point out several individuals, now bankrupt in fortune, who used to enjoy a high character for goodness of heart and liberality to all in distress, and even yet have a kind of twilight fame on that account, though nothing can be more obvious than that their benevolence was at the expense of no self-denial to themselves, no labour, nothing but the trouble of putting their hands into the pockets of their neighbours. The persons upon whom the expense ultimately fell, could have done three times more good with a third part of the money, and had the credit of it to themselves; but the world, which seldom forms a complicated idea, fails to see this. Now, there is nothing in such a case but injustice, and all injustice must be denounced. We would even exercise so vigilant a jealousy as to the benevolence of certain persons, that, unless we were favoured with a sight of their accompts, we would not give them credit for beneficence to the amount of a single penny. Another thing is to be considered—the appreciation of the money on the part of the giver. If a man gives a sixpence, with a full sense of the value of a sixpence, a recollection of what it cost him to gain it, and a prescience of the extent of service which it may be of to the receiver, he is, in our opinion, entitled to a thousand times more credit than he who tosses over his shoulder a half-crown which he did not gain, does not know how to gain, and of the value of which, either to himself or to the person receiving it, he is ignorant.

BIOGRAPHIC SKETCHES.

THE GOWS.

No name connected with Scottish music is so celebrated as that of Gow, which belonged to two individuals, father and son, who in this country long stood at the summit of professional excellence as violinists and composers.

Neil Gow, the father, was born of humble parents at Inver, near Dunkeld, in Perthshire, in March 1727. He was intended, it appears, for the trade of a plaid weaver, but discovering an early propensity to music, he began the study of the violin himself, and soon abandoned the shuttle for the bow. Up to the age of thirteen, he had no instructor; but about that time, he availed himself of some lessons from a follower of the house of Grandtully, and soon placed himself at the head of all the performers in the country, although Perthshire then produced more able reel and strathspey players than any other county in Scotland. Before he reached manhood, he had engaged in a public competition there, and carried off the prize, which was decided by an aged and blind, but skilful minstrel, who, in awarding it, said, that "he could distinguish the *stroke of Neil's bow* among a hundred players." This ascendancy he ever after maintained, not only in his native place, but throughout Scotland, where it was universally admitted that, as a reel and strathspey player, he had no superior, and, indeed, no rival in his own time.

Living in the immediate neighbourhood of Dunkeld house, he was early noticed and distinguished by the Duke of Athol and his family, which was soon followed by the patronage of the Duchess of Gordon, and the principal nobility and gentry throughout Scotland. But while his permanent residence was at Inver, near Dunkeld, he was not only employed at all the balls and fashionable parties in the county, but was in almost constant requisition at the great parties which took place at Perth, Cupar, Dumfries, Edinburgh, and the principal towns in Scotland. So necessary was he on such occasions, and so much was his absence felt, that at one time, when indisposition prevented him attending the Cupar Hunt, the preses called on every lady and gentleman present to "dedicate a bumper to the better health of Neil Gow, a true Scottish character, whose absence from the meeting no one could sufficiently regret." In many instances, those skilled in the musical as well as other professions, commit the egregious error of allowing themselves to fall into dissipated habits, trusting that the possession of genius is in itself able to cover breaches in morals, and a multitude of faults and eccentricities. Neil Gow was not a person of this description. He was a man most exemplary in all the private relations of life—a faithful husband, an affectionate parent, and a generous friend. He was, moreover, possessed of a fund of broad humour, which rendered him a welcome guest wherever he visited.

In a professional point of view, Neil Gow is to be judged according to circumstances. He never had the advantage of great masters, and indeed was almost entirely self-taught. He did not, as far as is known, attempt the composition of difficult or concerted pieces. He was one of nature's musicians, and confined himself to what genius can conceive and execute, without the intervention of science. He composed a great number of tunes, nearly a hundred of which are to be found in the collections published by his son Nathaniel at Edinburgh. The greater portion of them are of a lively character, and suited for dancing, such as reels, strathspeys, and quick steps. It would not be interesting in a notice like this to enumerate the titles of so many compositions; but we may safely refer to the beautiful air "Locherroch-side," to which Burns wrote his pathetic ballad, "Oh! stay, sweet warbling woodlark, stay," and his "Farewell to Whisky," as specimens which entitled him to take his place among the best known composers of Scottish music which our country has produced.

This celebrated man, "the famous Neil," whose name continues in Scotland as familiar as a household

word, died in the village in which he was born, on the 1st of March 1807, in the eightieth year of his age, after acquiring a competence, which was divided among his children. He left behind him two sons and a daughter: John, who settled in London as leader of the fashionable Scottish bands, and who died in 1827, after acquiring a large fortune; Nathaniel; and Margaret, now the only surviving child, who is at present living in Edinburgh. Two sons, William and Andrew, also distinguished for their musical abilities, died before him.

Nathaniel Gow, who must be considered as having been the most eminent of his family or name, not only as a performer and composer, but as having, more than any other, advanced the cause and popularity of our national music during his time, was born at the birth-place of his father in Perthshire, in 1766. Nathaniel was indebted to his father for his first instructions. He commenced on a small violin commonly called a *kit*, on which his father Neil had also made his first essay, and which is still preserved in the family. At an early age he was sent to Edinburgh, where he continued the study of the violin, first under Robert M'Intosh, or Red Rob, as he was styled, until the latter, from his celebrity, was called up to London. He next took lessons from M'Glashan, who was in high estimation as an excellent composer of Scottish airs, and an able and spirited leader of the fashionable bands. He studied the violincello under Joseph Reneagle, a person of some note in the musical world, who, after a long residence in Edinburgh, was appointed to the professorship of music at Oxford. After the death of M'Glashan, he continued under his elder brother William, whom he succeeded as a leader, a situation for which he was well fitted by his bold and spirited style; but having been cut off about the year 1791, at the early age of forty, Nathaniel took his place, and maintained it for nearly forty years, with a degree of success far beyond any thing that ever preceded or followed him.

So early as 1782, when not more than sixteen years of age, Nathaniel was appointed one of his majesty's trumpeters for Scotland, a situation almost sinecuriai, which he held during his life, with a small salary of L.70 per annum. He had for many years previously, by assuming the lead of the fashionable bands, become known not only as an excellent violin player, but as a successful teacher, and as having arranged and prepared for publication the first three numbers of the collection of reels and strathspeys published by his father. So much, however, and so quickly did he advance in reputation after this, and so generally did he become acquainted with the great and fashionable world, that, in 1796, without giving up or abating his lucrative employment as leader, he commenced business as a music-seller on an extensive scale, in company with the late Mr William Shepherd, and, for fifteen or sixteen years, commanded the most extensive business perhaps ever enjoyed by any house in the line in Scotland. In 1813, however, after his partner's death, the business was wound up, and whatever profits he may have drawn during the subsistence of the partnership, he was obliged to pay up a considerable shortcoming at its close.

It was in 1799 that he continued the work commenced by his father and himself; and from that time till 1824, in addition to the three first collections, and two books of slow airs, dances, waltzes, &c., he published a fourth, fifth, and sixth collection of strathspeys and reels; three volumes of beauties, being a republication of the best airs in the three first collections, with additions—four volumes of a repository of Scots slow airs, strathspeys, and dances—two volumes of Scots vocal melodies, and a collection of ancient curious Scots melodies, besides a great many smaller publications, all arranged by himself for the harp, piano-forte, violin, and violincello. During the life of his father, he was assisted by him, and the first numbers were published as the works of Neil Gow and Son. Many collections had been published previously by ingenious individuals, the best of which, perhaps, was that of Oswald; but Gow's collections, beyond all dispute, are the most extensive and most complete ever submitted to the public; embracing not only almost all that is good in others, but the greater part of the compositions of Neil and Nathaniel Gow, and other members of that musical family.

After an interval of a few years, Gow commenced music-seller once more, in company with his only son Neil, a young man of amiable and cultivated mind, who had received a finished education at Edinburgh and Paris for the profession of surgeon, but who, finding no favourable opening in that overstocked calling, and having a talent and love for music, abandoned it, and joined his father. This young gentleman, who was the composer of the beautiful melody of "Bonny Prince Charlie," and a great many others, was not long spared to his father and friends, having been cut off by a lingering disease in 1823. The business was afterwards continued until 1827; but, wanting a proper head—Gow himself being unable to look after it—it dwindled away; and poor Gow, after a long life of toil, during which he had gathered considerable wealth, found himself a bankrupt at a time when age and infirmity prevented him from doing any thing to retrieve his fortunes.

It is difficult to describe the influence, success, and reputation of Nathaniel Gow, during all the time he conducted the fashionable bands in Edinburgh and throughout Scotland; but certain it is, that in these respects he stands at the head of all that ever trod in the same department. Not only did he preside at the peers' balls, Caledonian Hunt balls, and at the parties of all the noble and fashionable of Edinburgh, but at most of the great meetings and parties that took place throughout Scotland; and in several instances he was summoned to England. No expense deterred individuals or public bodies from availing themselves of his services; and it appears from his memorandum books, that parties frequently paid him from one hundred to one hundred and fifty guineas, for attending at Perth, Dumfries, Inverness, &c., with his band. One of the first objects in the formation of fashionable parties, was to ascertain if Gow was disengaged, and they would be fixed, postponed, or altered, to suit his leisure and convenience. He visited London frequently, although he resisted many invitations to settle there permanently. While his evenings were occupied at the parties of the great, his days were not spent in idleness. He had as his pupils the children of the first families in the country, for the violin and piano-forte accompaniment; from whom he received the highest rate of fees known at the time.

Although thus engaged in the most extensively patronised musical establishment in Scotland, it is questionable if he ever at any time realised profit from it; while it is certain, that, towards the close, he was a great loser; indeed, it can seldom be otherwise where the proprietor has other avocations, and leaves the management to his servants. But from his balls, teaching, and playing, the emoluments he derived were very great; and he was at one time worth upwards of L.20,000; but this was ultimately swept away; and he was forced, while prostrated by a malady from which he never recovered, to appeal to his old patrons and the public for their support, at a ball for his behoof, in March 1827, which he did by the following circular:—"When I formerly addressed my kind patrons and the public, I had no other claim than that which professional men generally have, whose exertions are devoted to the public amusement. By a patronage the most unvarying and flattering, I was placed in a situation of comfortable independence, and I looked forward without apprehension to passing the decline of my days in the bosom of my family, with competence and with happiness. Unfortunately for me, circumstances have changed. By obligations for friends, and losses in trade, my anxious savings have been gradually wasted, till now, when almost bed-rid, unable to leave my house, or to follow my profession, I am forced to surrender the remnant of my means to pay my just and lawful creditors. In this situation, some generous friends have stepped forward, and persuaded me, that the recollection of my former efforts to please may not be so entirely effaced, as to induce the public to think that my day of distress should pass without notice or without sympathy."

The appeal was not in vain—the ball was crowded, and handsome tokens of remembrance were sent by many of his old friends, so that nearly L.300 was produced. The ball was continued annually for three years afterwards, and though not so great as the first, they still yielded sufficient to prove the deep sympathy of the public, and to afford him a consolation and support in his hour of trial and sickness. It should not be omitted, that the noblemen and gentlemen of the Caledonian hunt, who had, during all his career, been his warmest patrons, voted fifty pounds per annum to him during his life.

Nathaniel Gow was a man of great shrewdness and good understanding—generally of a lively companionable turn, with a good deal of humour—very courteous in his manners; though, especially latterly, when misfortune and disease had soured him, a little hasty in his temper. The illness into which he fell came to a crisis in the beginning of 1831, and finally terminated in his death, on the 17th of January of that year, at the age of sixty-five. He was twice married, and left several sons and daughters, who still survive.*

* From two articles in the "Biography of Distinguished Scotsmen," by Robert Chambers.

A CHAPTER FOR THE INDUSTRIOUS.

A LITTLE pamphlet, entitled "Hints to the Working Classes, explanatory of their True Interests, and the Effects of Trades' Unions," has just fallen under our observation, and seems to contain some well-written opinions on the subject of which it professes to treat. The following observations are obviously congenial with the truest principles of political economy, and certainly worthy of the deepest consideration:—

"I shall endeavour to show (says the author) that it is not by restricting, but by encouraging industry, that the value of labour may be raised, and the true interests of the working classes promoted.

The general rate of wages is naturally regulated by the proportion which the supply of workmen bears to the demand for labour; therefore wages may be raised, either by encouraging emigration, and thereby diminishing the number of labourers, or by extending manufactures and agricultural improvements, and thereby increasing the employment of labour.

Britain, with its dependencies, presents a wide field for the consumption of our manufactures, but not nearly sufficient to receive all that we produce; when we look abroad, however, we find that the quantity which the foreign market is capable of receiving, is only limited by the cost at which we can furnish the supplies. The inhabitants of almost every country manufacture by far the greater proportion of the articles which they require for their own use; but whenever they find articles of foreign manufacture offered to them for sale at lower prices than they could make them for themselves, they purchase those articles, and employ their labour in some more profitable way. The extent of foreign demand, then, for our manufactures, under a free commercial system, depends entirely upon their comparative cheapness; and their cheapness depends upon the superiority of our powers of production over those of other people. Therefore, all new improvements in machinery, chemistry, &c., by means of which our powers of production are increased, and we are enabled to bring our goods to market at a cheaper rate, must add to the extent of our trade, raise the value of labour, and tend to improve the condition of the working classes.

It would be a foolish and short-sighted policy to reject the introduction of improved machinery into any manufacture, because its immediate effects might be to deprive a few people of employment. Any improvement in machinery which effects a saving of expense in the manufacture into which it is introduced—by superseding, in some degree, the necessity of employing manual labour—must, of course, cause a reduction in the price of the manufactured commodity; hence an increase of consumption, and an additional employment of labour and machinery to supply the demand: and as manufactures are so connected that one branch cannot be extended without extending others that are subsidiary, so an improvement in machinery, although it may diminish the number of persons employed in the particular branch that receives it, will almost invariably be found to cause an increase of employment upon the whole. Manufacturers are frequently forced, by the troublesome conduct of their workmen, to use machinery, when manual labour might be employed with equal advantage; but, under ordinary circumstances, machinery is never brought into operation, unless a great saving of expense is to be effected by its introduction, because a manufacturer will not invest capital in new machinery, unless, by doing so, he has a fair prospect, in the first instance, of obtaining considerable advantage. The introduction of the power-loom was one of those improvements which, in the first instance, appeared most alarming to the working classes; but it was, in a great measure, by means of that invention, that we were enabled to extend our cotton trade, and to compete successfully with the low prices paid for weaving in other countries. It is true, weavers' wages are not nearly so high as they were previous to the introduction of the power-loom, but their wages would have fallen independently of that event; because it was necessary that weaving should be done in this country at as low a rate as elsewhere, otherwise we should have lost the foreign part of that trade. Now, every one acquainted with the subject knows, that although the wages of weavers have been depressed, yet every branch of the cotton manufacture has been so extended, that, upon the whole, there has been a great increase of employment for labour; and the working classes generally have derived much benefit from the invention of the power-loom. Nor would the poor weavers have suffered so much in consequence of the introduction of that improvement, but for those cruel and arbitrary measures on the part of other operatives, who, by monopolising their respective trades, prevented the weavers from procuring other employment, and deriving their just share of the benefit which arose out of the increased demand and employment for labour. There are few improvements, however, that interfere so much with manual labour as the above; and most of them are introduced so gradually and imperceptibly, that their effects can hardly be traced, although, when combined with others, they become exceedingly important and valuable.

Next with regard to wages: If wages were fixed by law at a high rate, and population to continue to increase, the consequence would be, that a portion of workmen would be employed at the good rate of wages fixed by law, but the rest would be unemployed and reduced to beggary. On the other hand, if the rate fixed by law was too low, then all would be fully employed, but the most industrious and valuable workmen would be reduced to a level with the idle and ignorant; which proves that the restrictions well-meaning people would impose, for the better regulation of wages by boards of trade, &c., are worse than useless, in as much as their tendency is to prevent the extension of manufactures, and diminish the employment and value of labour.

The old-fashioned system of monopolies is fast breaking up: it was a system for giving the *few* some advantage at the expense of the *many*—a system which, carried to its full extent, would be the most injurious that could well be imagined, as it would be difficult to conceive a more efficient plan for arresting the progress of improvement. Yet there are some good people weak enough to regret the discontinuance of the system, and to predict all manner of evil from the effects of competition. Now, competition among all classes is the grand stimulus to industry and ingenuity, and it is only by industry and ingenuity that wealth and comfort can be maintained or increased.

It is not possible for workmen to raise the general rate of wages by such measures as the 'Trades' Unions' adopt; because their measures have no ten-

dency to increase employment, but, on the contrary, by preventing the free exercise of industry and talents, they retard the progress of manufactures, and even endanger their transfer to other countries. Their plans are founded upon the selfish principle of every man protecting his own trade, that is to say, excluding as much as possible the employment of new hands; and by preventing fair competition in the market for labour, they endeavour to force their employers to pay higher wages. Now, it is quite evident, that, if they are successful by that means in obtaining higher wages to themselves than they are justly entitled to receive, it must be at the expense of their fellow-workmen who are kept out of employment, and the rest of the community; and they have no right to raise themselves by injuring others. But all attempts to raise wages by unjust and artificial means must, in the end, prove fruitless, and intelligent workmen should be convinced of this by the experience of late years. How many instances have they observed of labourers in particular employments attempting to raise their wages above their natural level by combinations—striking work—and after enduring great hardships and privation, submitting to lower wages than they had before! They are not aware of the extent of mischief they do to themselves by combining and refusing to work, or of the consequences which would follow if they were to succeed in establishing unnaturally high wages, otherwise they would never make the attempt. All that workmen should do is to prevent unnecessary depression of wages, which may be done without putting themselves to much trouble or expense. Let them individually, by the frugal management of their wages, save a little money, and thus place themselves in such circumstances that they are not obliged to accept of lower wages at every stagnation of trade. The comfort and happiness of a workman depends much more upon the good management and proper disposal of his earnings than upon their amount.

I have endeavoured to show, that wages never can be maintained above their natural level by artificial means; that their natural level depends upon the proportion which the population, or supply of workmen, bears to the demand for labour, or extent of employment; that the extent of employment depends upon our superior powers of production, improvements in machinery, and amount of accumulated capital; that the interest of the workman and his employer are the same; and that the prosperity of both depends upon their united industry and ingenuity.

We are now on the eve of having new fields opened up for the consumption of our manufactures, and it is of great consequence that nothing should prevent our enjoying the full advantage of that favourable circumstance. We are also obtaining relief from various restrictions which fettered commercial enterprise, and prevented our enjoyment of free trade with other countries; and we possess a government disposed to use every means for the encouragement of industry, and the improvement of the condition of the working classes. It remains, then, to be seen whether the people of this country are sufficiently virtuous to use their liberty with discretion, or whether they will continue to oppress each other, and run into all manner of wild and foolish excesses."

SERPENT HUNTING,

AN ADVENTURE IN SOUTH AMERICA.

Business connected rather with pleasure than profit had kept me roaming for some months among the West India islands, that land of magnificence and discomfort; and from all that I heard there, and more particularly from what came under my own observation, I can truly affirm that to Europeans in general it is a land replete with novelty and interest, and to writers both of fiction and of truth, a field in which they may reap an abundant harvest of reputation. I at length found myself at Barbadoes, without any fixed resolution either to return or to proceed farther on in my wanderings. In such a wavering and unsettled state of mind, a little matter will sometimes turn the scale. I had carried a letter to a gentleman of the island, with whom I formed a most agreeable acquaintanceship; and in consequence of the description he gave me of the coast of South America, I was induced to form the resolution of visiting at least a part of that country before I should think of bending my course homewards. Being furnished by him with letters to one or two individuals who might be of service to me, I took a passage in a ship bound to Demerara, and after a voyage in no degree remarkable for shortness or novelty, I landed there in safety. I will not stop here to describe all I saw. Suffice it to say, that having viewed all I considered worthy of being noticed, I set off across the country to deliver one of the letters I carried with me to a gentleman from whose attention and knowledge I had been assured I should obtain much information. After a journey of some days, I reached the place; and considering that I had been previously an utter stranger, I was received with a degree of warmth and kindness I could scarcely have anticipated. The estate, or rather plantation, on which I had been so kindly invited to take up my residence for some time, and where I had resolved to spend a few weeks in examining the local scenery and curiosities, lay upon the banks of a river that comes down from the mountains of Guiana. Mr Heinvault (*the proprietor*), although the superintendence of his estate occupied a great part of his time, contrived to devote no inconsiderable portion of it to my amusement. Accompanied by a couple of servants, and Cæsar, a shrewd and active negro who held the post of *hunter* (a personage not only useful, but even necessary to those who reside on colonial estates distant from any town, as many of the delicacies of the table are furnished by him), we made frequent excursions up the country, and committed occasionally sad havoc among the quadrupeds and feathered tribes with which that region abounds. At other times we manned a couple of canoes, and descending the river, we employed ourselves in fishing excursions, or in taking a shot at such birds as unfortunately for themselves came within range of our pieces. Those who are acquainted with the general appearance and topography of the northern coast of South America, know well that from the flatness of the country as it approaches the sea, many rivers of considerable magnitude divide themselves into numerous streams or canals, before mingling their waters with those of the ocean. The deltas or islands formed by those streams are sometimes of great extent, consisting, like most of that coast, of marshy or savannah land, partly bare, and partly overrun by tall reeds and canes, or other aquatic plants. In the thick and almost impervious recesses of these, reptiles of various kinds often find a retreat, from which they occasionally emerge in search of their prey. The streams are in many places frequented by aquatic birds of the most variegated and beautiful plumage, and the waters afford several kinds of fish, which from their delicacy and flavour amply repay the labour employed in taking them.

I had been informed, both by Mr Heinvault and Cæsar, that serpents of a great size had been frequently seen by them crossing the lagoons from one island to another, and that by great exertion, and not without difficulty, they had succeeded in destroying a few. I confess I had been for some time anxious to discover one of these reptiles; not that I wished a close connection with it—far from it. The little I had seen of them had given me an aversion to them, and this feeling was much heightened by the numerous stories I had heard of their fearful powers of destruction and deglutition. I had no objections, however, to view one at a distance, "dragging its slow trembling length along." But in all our excursions nothing of this kind was to be seen, and I had begun to conceive some latent suspicions that Mr Heinvault and Cæsar had a little exaggerated the number and size of the reptiles they had seen and destroyed. But an adventure soon after this befell me, which made me entirely change my opinion of their veracity, and convinced me that their account rather fell short of than exceeded the truth. Occasionally when pressing business detained Mr Heinvault at his plantation, or called him to a distance, and when I found time hang heavy on my hands, Cæsar was always willing to volunteer his services as my guide and assistant in any rambles which I wished to undertake; and a clever and active fellow I indeed found him. He was a capital shot, and unequalled in the success with which he contrived to hook his fish when not one would look at the bait belonging to another.

One day about two or three weeks after my arrival, Mr Heinvault informed me that he was under the necessity of going to a plantation distant about ten miles, and as the way lay partly through the woods and trackless savannahs, he was obliged to take Cæsar with him, he being the only one on the estate who had a thorough knowledge of the way, and who, from his dexterity and address, proved a useful and agreeable attendant. He added, that he should be back early in the afternoon, and that if I wished to take a stroll, or go on the water, any of the rest of his people should be at my disposal. After Mr Heinvault had rode away, I strolled about the plantation an hour or two, looking at every thing to amuse myself; but getting terribly wearied with doing nothing, I told one of the people to get the lines ready, for it was my intention to go out a-fishing for some time, the day being rather warm and sultry for enjoying a shooting excursion. These being soon ready, I sent likewise for my gun, and declining the offer he made to attend me, I pushed out into the stream, and dropped slowly down the river. The current being very slow, I was a while in reaching the place where the river branches off into a number of streams. I guided my canoe into one of those in which I had formerly been along with Cæsar, and where our sport had been very good. The stream was not in general above eighteen or twenty feet wide. I "paddled my light canoe" up and down this, trying to get a shot at some of the beautiful birds which often frequent these lagoons. But the birds were scarce and shy. Fatigued with this unsuccessful sport, I set the lines, and paddling about for some time, I drew them up; but whether they had not been baited as well as Cæsar used to do it, or whether the fish were as shy as the birds, I cannot tell; but after a few trials I got tired of this sport likewise. Thinking I would be more successful elsewhere, I proceeded about a quarter of a mile farther down, and set the lines. By this time the day had become exceedingly sultry and oppressive. Seeing there was no prospect of a shot, I took off my stockings and shoes, and bathed my feet in the water, and, working my canoe to the other side, I laid my gun ready loaded for a shot upon the benches, and stretched myself alongside of it, waiting till it was time to draw the lines which I had set. In this position I fell asleep, overcome, as I suppose, by the heat of the day, and the fatigue I had undergone.

I know not how long I may have slept; but I was roused from my slumber by a curious sensation, as if some animal were licking my foot. In that state of half stupor felt after immediately awaking from sleep, I cast my eyes downward, and never till my dying day shall I forget the thrill of horror that passed through my frame on perceiving the neck and head of a monstrous serpent covering my foot with saliva, preparatory, as immediately flashed upon my mind, to commencing the process of swallowing it. I had faced death in many shapes—on the ocean—on the battle-field; but never till that moment had I conceived he could approach me in a guise so terrible. For a moment, and but a moment, I was fascinated. But recollection of my state soon came to my aid, and I quickly withdrew my foot from the monster, which was all the while glaring upon me with its basilisk eyes, and at the same moment I instinctively grasped my gun, which was lying loaded beside me. The reptile, apparently disturbed by my motion (I conceive it had previously, from my inertness, taken me for a dead carcase), drew its head below the level of the canoe. I had just sufficient time to raise myself half up, pointing the muzzle of my piece in the direction of the serpent, when its neck and head again appeared moving backwards and forwards, as if in search of the object it had lost. The muzzle of my gun was within a yard or two of it: my finger was on the trigger: I fired, and it received the shot in its head. Rearing up part of its body into the air with a horrible hiss, which made my blood run cold—and, by its contortions, displaying to my sight great part of its enormous bulk, which had hitherto escaped my notice—it seemed ready to throw itself upon me, and to embrace me in its monstrous coils. Dropping my gun, by a single stroke of the paddles I made the canoe shoot up the stream out of his reach. Just as I was escaping, I could observe that the shot had taken effect, for blood was beginning to drop from its head. But the wound appeared rather to have enraged than subdued him. Unfortunately, all my shot was expended, otherwise I would most certainly, at a respectable distance, have given him a salutation of the same kind as I had just bestowed. All that I have described passed in a much shorter time than I have taken up in recounting it.

As I went up the stream with all the velocity I could impart to the canoe, I heard the reeds, among which the animal was apparently taking refuge, crashing under its weight. I never once thought of the lines I had left; but hurrying as fast as the canoe would go through the water, I was not long in reaching the landing-place below Mr Heinvault's house. Hastily mooring the canoe, I jumped ashore, and hurried up to the house, where I found Mr Heinvault, who had just arrived. You may be certain I lost no time in communicating to him the almost miraculous escape I had made, and the wound I had inflicted on the animal. "In that case," said he, "it cannot escape; we must immediately go in search of it;" and instantly summoning Cæsar, he told him to get the guns ready, and to bring two of his fellows with him. "If you choose to assist us in finishing the adventure you have begun, and to have a second encounter with your novel antagonist, we shall show you some of the best and most dangerous sport our country affords." I protested that nothing was farther from my intention than staying behind, and added, that had not my shot been expended, we should not have parted on so easy terms. "In general," said he, "it is very dangerous to attack them at close quarters after being wounded, as they become extremely infuriated; and there are not wanting instances in which life has been sacrificed by doing so. But we now take such precaution in approaching them, that it is next to impossible that any accident can happen." Just as he finished saying this, Cæsar re-appeared, himself armed with a club, one of those who followed him carrying a weapon of the same kind, while the other was armed with a weapon similar to a billhook. This Mr Heinvault told me was to clear a road among the reeds, if the animal should have retreated among them; the club being reckoned the best instrument for a close encounter. We were soon seated in the canoes, and gliding down the stream as fast as a couple of pairs of brawny arms could urge us. In a short time we reached the spot where my adventure had happened. The small part of the bank not covered with reeds, bore, from its sanguine hue, evident proof that the wound the animal had received could not have been slight. Exactly opposite this the reeds were crushed and broken, and a sort of passage was formed among them so wide, that a man could with little difficulty enter. Mr Heinvault commanded a halt, to see that the arms were in proper order. All being right, we listened attentively, in order to hear if there was any noise which might direct us to our enemy. No sound, however, was heard. One of the negroes entered first, clearing with his billhook whatever obstructed our way. He was followed by Mr Heinvault and me, with our guns; while Cæsar and his fellow-servant brought up the rear. The reeds were in general nearly double our height, and at the same time pretty close. However, we easily made our way through them, partly assisted by the track which the serpent had evidently made.

We had penetrated, I should suppose, about thirty yards, when the fellow who was in advance gave the alarm that we were close upon the animal. Mr Hein-

vault ordered him behind, and, advancing along with me, we saw through the reeds part of the body of the monster coiled up, and part of it stretched out; but owing to their thickness its head was invisible. Disturbed, and apparently irritated by our approach, it appeared, from its movements, about to turn and assail us. We had our guns ready, and just as we caught a glimpse of its head, we fired, both of us almost at the same moment. From the obstruction of the reeds, all our shot could not have taken effect; but what did take effect, seemed to be sufficient; for it fell, hissing, and rolling itself into a variety of contortions. Even yet it was dangerous to approach it. But Cæsar, who seemed to possess a great deal of coolness and audacity, motioning his master and me not to fire again in the direction of the animal, forced a way through the reeds at one side, and, making a kind of circuit, came in before it, and succeeded in hitting it a violent blow, which completely stunned it; and a few repetitions of this gave us the victory. We could now examine the creature with safety. We found that a good part of our shot had lodged about its head and neck, and would probably have proved fatal to it, even if we had left it to its fate. I confess it was not without a shudder that I handled and examined it, when I thought how nearly I had escaped from furnishing it with a meal.

We set ourselves to work, and not without difficulty did we succeed in dragging the huge carcase to the edge of the stream, and in embarking it in one of the canoes, to which it formed a pretty fair lading. It was not far from sunset when the expedition landed on the bank near Mr Heinvault's house. He soon got sufficient assistance in conveying the carcase up, and in depositing it in a place of safety. On measuring it, we found it to be nearly forty feet in length, and of proportional thickness. Mr Heinvault informed me that it was the largest he had seen killed, although he had often seen others under circumstances which convinced him that they must have been of a far greater size.

It was not until I was seated at a late dinner, that I felt myself a little overcome with the unusual exertion I had undergone on so sultry and oppressive a day. But as the evening wore on, I completely recovered; and never do I recollect spending a more agreeable one. The adventure, however, and the consciousness of my escape, must have been deeply impressed upon my mind; for, during some months after, I often started from my sleep with the cold sweat upon my brow, imagining myself crushed and expiring in the embraces of a horrid reptile.*

THE GAME OF GOLF.

In Scotland there prevail two sports for which there is hardly a parallel in the adjoining country: namely, golf and curling. The former is practised on commons, or any other kind of open grounds, it being only necessary that the grass should be very short. The chief implement is a club, called the golf, consisting of a long slender wand, and a loaded mass at the end, together with a small ball of leather, stuffed to great hardness with feathers, which is impelled by the above instrument, and to get which into a distant hole by the fewest strokes constitutes the game. The word *golf* is supposed to be derived from the German noun *kolbe*, a club. The game is very ancient, and has not been always confined to Scotland. In Strutt's "Sports and Pastimes of the People of England," it is mentioned, that "there are many games played with the ball, that require the assistance of a club or bat, and probably the most ancient among them is the pastime now distinguished by the name of goff. In the northern part of the kingdom, golf is much practised. It answers to a rustic pastime of the Romans, which they played with a ball of leather stuffed with feathers, called paganica, and the goff-ball is composed of the same materials to this day. In the reign of Edward the Third, the Latin name cambuca was applied to this pastime, and it derived the denomination, no doubt, from the crooked club or bat with which it was played."

It seems to be quite uncertain at what period the game of golf was introduced into Scotland; but it may be fairly presumed that this amusement, as well as football and archery, were practised to a considerable extent in the reign of our King James the First.

King Charles the First was much attached to the amusement of golfing, and, on his visit to Scotland in 1641, was engaged in it on Leith Links, when intimation was given him of the rebellion in Ireland; whereupon he threw down his club, and returned in great agitation to Holyroodhouse.

The Duke of York, afterwards James the Second, also delighted in the game. By joining publicly in it and other sports, he softened down among the Scottish nobility much of the prejudice excited by his unpopular principles; while his duchess equally pleased the ladies by treating them with *tea*, which had not till then been seen in the kingdom.

Many names might be added of illustrious individuals, who, in days gone by, as well as in more modern times, found relaxation and delight in practising the game; but none will create greater interest than that of Lord President Forbes. He is said to have been so keen a golfer as to play on the Sands at Leith, if the Links happened at any time to be covered with snow.

The mode of playing the game does not appear to be the same in all countries—at least the practice in Holland is different from that of England and Scotland. The method among us seems to resemble that of the Romans more than the Dutch. The game of the latter is particularly described in the following interesting communication, in the Statistical Account, by Dr Alexander Walker of Edinburgh, to Dr Carlyle of Inveresk:—

"The Dutch game called *kolf*, from which the word *golf* is derived, as both are probably from the Greek word *kolophos*, is played in an enclosed rectangular area of about sixty feet by twenty-five. The floor, which is a composition of sand, clay, and pitch, is made as level as a billiard-table; and the enclosing walls are for two feet above the floor, faced either with polished stone or sheet-lead, that they may cause the ball to rebound with accuracy. At about eight or ten feet from each end wall, a circular post of about five inches diameter is placed precisely in the middle of the area with regard to breadth, consequently opposite the one to the other, and at the distance of forty feet, or thereby. The balls used in the game are about the size of cricket-balls, made perfectly round and elastic, covered with soft leather, and sewed with fine wire. The clubs are from three to four feet long, with stiff shafts. The heads are of brass; and the face, with which the ball is struck, is perfectly smooth, having no inclination, such as might have a tendency to raise the ball from the ground. The angle which the head makes with the shaft, is nearly the same with that of the putting clubs used at golf. The game may be played by any number, either in parties against each other, or each person for himself; and the contest is, who shall hit the two posts in the fewest strokes, and make his ball retreat from the last one with such an accurate length, as that it shall lie nearest to the opposite end wall of the area. The first stroke is made from within a few inches of what is called the beginning post, and the player directs his ball as precisely as he can on the opposite one, that he may hit it if possible, computing at the same time the force of his stroke, so that, should he miss it (which from the distance may be supposed to be most frequently the case), his ball may rebound from the end wall, and lie within a moderate distance of the post, and before it; that is, between the two posts, rather than between the post and the end wall. The reason of preferring this situation of the ball will appear by reflecting how much easier it is, in that case, to send the ball, after striking the post, back again towards the other one. The skill of the game consists in striking the post in such a way, whether full or otherwise, as may send the ball towards the place where you wish it to rest. It combines the address required both in golf and in billiards. Five points make the game; and such is the difference between a capital and an ordinary player, that the former will give four points of the game, and frequently be the winner. This superiority of play I experienced myself at a *kolf baan* near the Hague, after I had considerable practice in the game, and was, in fact, no mean player. With the advantage of three points I was completely beaten; and even when I got four, I could hardly preserve any tolerable equality. There is generally a kind of apartment at one end of the *kolf baan*, two or three steps higher than the floor, where spectators may enjoy the sight of the game, as far as the clouds of tobacco smoke, with which they commonly fill it, will allow."

The game has been long known in India; and the following notice of the mode in which it is practised, is given from a letter addressed to the secretary of the Musselburgh club by one of its members, whose attainment in the knowledge of eastern languages is of a very high order:—

"The Indian, or rather the Persian, name of the game, is *govy* (strongly resembling the Scotch pronunciation of golf, viz. 'gouf'), meaning 'the ball;' and sometimes called 'chougan o govy,' or club and ball. The game is considered a royal one in the East, and is uniformly played on horseback. The club (according to the representation I have seen in pretty old Persian paintings of a party at play) is bent at the end, and somewhat like our own clubs. The handle, agreeable to the same drawing, seemed a good deal shorter, so as when a player was about to strike the ball, he was necessarily obliged to throw his body downward to the right side of his horse, with the chougan in his right hand, whilst he grasped the bridle, and guided his steed (usually at full gallop) with the left. The manuscript in which I saw the representation, was a highly celebrated work on the ancient history of Persia, by Ferdousi, esteemed one of the best Persian poets."

The game of Palle Maille, or Pall Mall, which is mentioned in Strutt's book, as bearing a resemblance to golf, was played by striking a ball with a mallet through a high arch of iron, the merit consisting in doing so at the fewest number of strokes. Charles the Second and his courtiers practised this game in St James's Park, where there is a walk still called the Mall; the name being supposed to be derived from the mallet with which the game was played.

The question seems to have been once agitated, whether the game of golf was peculiar to England or Scotland. The importance of the inquiry is scarcely such as to command great investigation; but there is a tradition connected with it, which, if an ancient mode of determining disputed points be a correct one, must be considered as setting the matter for ever at rest. It is related as follows:—

"Two English noblemen, who, during their attendance at the Scottish court, had, among other fashionable amusements of the period, occasionally practised golf, were one day debating the question with his Highness the Duke of York, whether that amusement were peculiar to Scotland or England; and, having some difficulty in coming to an issue on the subject, it was proposed to decide the question by an appeal to the game itself; the Englishmen agreeing to rest the legitimacy of their national pretensions as golfers, together with a large sum of money, on the result of a match, to be played with his highness, and any Scotchman he could bring forward. The duke, whose great aim at that time was popularity, thinking this no bad opportunity both for asserting his claim to the character of a Scotchman, and for flattering a national prejudice, immediately accepted the challenge, and, in the meantime, caused diligent inquiry to made as to where the most efficient partner was to be found. The person recommended to him for this purpose was a poor man, named John Paterson, a shoemaker, who was not only reputed the best golf-player of his day, but whose ancestors had been equally celebrated from time immemorial.

On the matter being explained to him, Paterson was not quite satisfied as to how he should be able to acquit himself in such great company; but on the duke encouraging him, he said he would do his best.

The match was played, in which the duke was of course completely victorious; and the shoemaker was dismissed with a reward corresponding to the importance of his service, being an equal share of the stake played for.

With this money he immediately built himself a comfortable house in the Canongate, upon the wall of which the duke caused an escutcheon to be affixed, bearing the arms of the family of Paterson, surmounted by a crest, a dexter hand grasping a golf club—Motto, 'Far and sure.'

The house alluded to is situated on the north side of the Canongate, a little above Queensberry House."

The town of Musselburgh has been long famous for superior golfers, the beautiful and extensive links on both sides of the Esk being an incitement to the practice of the athletic exercise. A golf club was established there in the year 1774, and included among its members the most respectable gentlemen in the parish. To encourage the exercise of the game, they procured a handsome silver cup, which is played for annually, and a year's possession of it, and the honour of being captain of the club, are the gainer's trophies. He is bound to append a medal to the cup when he restores it.

The game also flourishes at Edinburgh and Leith, and still more remarkably, perhaps, at St Andrews, where very large stakes are sometimes played for, and where there is a regular manufactory of balls, both for home consumption and exportation.

EDUCATION.

[BY JOHN BOWRING.]

A child is born—now take the germ, and make it
A bud of moral beauty. Let the dews
Of knowledge, and the light of virtue, wake it
In richest fragrance and in purest hues;
When passion's gust, and sorrow's tempest shake it,
The shelter of affection ne'er refuse,
For soon the gathering hand of death will break it
From its weak stem of life—and it shall lose
All power to charm; but if that lovely flower
Hath swell'd one pleasure, or subdued one pain,
O who shall say that it has lived in vain,
However fugitive its breathing hour?
For virtue leaves its sweets wherever tasted,
And scattered truth is never, never wasted.

—*Amulet*, 1828.

Since the publication of the article entitled "The Last Execution in the Grassmarket," we have had documents presented to us, which give a considerably different colour to the criminality of the culprit Andrews. It appears that he was, in reality, concerned in the maltreatment and robbery of the man Dykes, and was altogether a less innocent and estimable a member of society than our first information gave us to suppose. The article, in other respects, is correct. The jury upon Andrews's trial returned a verdict of guilty, from a servile respect to the bearing of the indictment, and not because they deemed his criminality worthy of the punishment of death; and, as already intimated, they were much chagrined on finding that their recommendation to mercy, upon which they had relied for the means of neutralising their decision, was of no avail.

London: Published, with Permission of the Proprietors, by Orr & Smith, Paternoster Row; G. Berger, Holywell Street, Strand; Bancks & Co., Manchester; Wrightson & Webb, Birmingham; Willmer & Smith, Liverpool; W. E. Somerscale, Leeds; C. N. Wright, Nottingham; Westley & Co. Bristol; S. No. 98. SATURDAY, DECEMBER 14, 1833. PRICE THREE HALFPENCE.

THE EASY MAN.

ALL extremes are bad—even, it would appear, the extreme of goodness; by which I mean good dispositions and habits of extraordinary bountifulness. It seems necessary that we should have a little of the reverse in us, just to defend ourselves against people who are the reverse. Some men are born as if they had been designed for the golden age, and by mistake postponed to the pinchbeck one. I was one of this class, but have been reformed for some time, and am now a pretty passable member of society. In my earliest years, I was distinguished for my good nature. Even before the school era, I was reduced to a wretched bondage by a somewhat elder brother, obliged to be hodman in all his architectural operations, compelled to give up the half of my gingerbread to him to purchase peace, and, in short, to use a comprehensive English phrase, was his fag. At school, I was always glad when I could oblige a boy by giving him a part of my bread and butter, or by helping him on with his exercises; yet, strange to say, this did not procure me any friendship or forbearance. The rascals, on the contrary, finding I had no power of resentment, tyrannised over me in every possible way. I was hustled and bustled about, huffed, cuffed, and disrespected, and all because I was good-natured. The same was my fate throughout all the earlier years of manhood. An insatiable love of approbation, an overpowering desire to serve and oblige all who seemed to require my services, characterised me. I was prone to believe every one, ready to befriend every one, anxious to reconcile every one; and many a poor hanger-on of the family, whom all the rest had got tired of, or found just reason to keep at a distance, maintained a hold on me, and was by me alone supported and cheered. Whoever had once got me into a personal interview, was sure of me. I could not—I had not it in me—to give pain to any one; and so mild and courteous was my tone, that even when applied to by an absolute mendicant, it would have puzzled a bystander sometimes to say whether he or I was the party in distress. The very beggar poets who came to me for half crowns, on the understanding that I was, like themselves, a dabbler in literature, would hold up their heads better than I. I felt in all these cases as if I were to blame in being better off than my fellow-creatures; and the relief which I extended was not so much designed for the good of the receiving party, as to justify the giver in enjoying what he retained. I had no discrimination: there lay my grand error. My charity as often gratified imposture as real want; my justice was sometimes most unjust to myself, or to those connected with me. What is curious, these propensities never forced me into a search for objects of benevolence. I rather avoided them—for I knew my weakness, and, like Hatteraik warning Glossin not to rouse him, would silently deprecate the coming temptation. Unfortunately, it was not necessary for me to go abroad for the means of exercising my good dispositions: the world, somehow or other, has done me *this* honour, that, though I never seek an acquaintance or pay a visit I can avoid, I have fully as many friends as I can make a good use of, and, in these my days of blindness, had always as many intruding petitioners as I could do any good to. Once let the petitioning or distressed party come in contact with me, I could no longer withhold my sympathy. Either I behoved to satisfy myself by the dispensation of a liberal alms, or I must instantly start off to spend my time and energies in advancing the interests of the applicant. In several instances, I am sure that I kept what I thought deserving people alive for months; in others, I got young men whom I thought possessed of abilities pushed into the situations and the ways of livelihood at which they aimed; in others (this was the largest class), I mediated to prevent the feelings of individuals from being offended by incidents and collisions which must have otherwise occurred. I had a horror of unkindness in thought, word, or deed; it annoyed me to hear scandal; and I preferred rather dullish conversation with plain and as I thought good-hearted people, to the most brilliant and dashy discourse of some professor of wit and raillery. I had a respect for every body but myself. What others did I always thought, or endeavoured to think, well of: what I did myself I never was so sure about, unless I heard some one praise it. This abject self-abasement was perhaps at the bottom of all my absurdities. My actions were directed to hardly any other end than that of conciliating men to think not so badly of me as I thought of myself, and, if possible, by their praise, to inspire me with a little more confidence in my own rights and merits. There might be a higher motive occasionally; but this was the main one, and I am now sensible that it leaves me without a just reason to complain of the ingratitude I have met with. A more discriminating kind of beneficence, springing from a more exalted source, would have been attended with different effects.

Such was my character for a considerable number of years. I had to look back upon a life, during which I had never experienced any thing above the most common-place favours from others—never looked for any thing of the kind—never thought of it; while I had been connected with innumerable persons who were perpetually petitioning me for something or other, and whose good opinions, worthless and unrequired as they were, I had been content to purchase at any price. My character might have been still the same, but for one peculiar event. I had often, as may well be believed, been put to pain by finding that my endeavours to do good were productive either of a greater evil to myself, or a less one to those I had befriended. I had often to feel the bitter pang which attends the display of ingratitude or rancour in one whom I had formerly esteemed and obliged. I had often—deepest mortification of all!—that of finding that my humane efforts to ward off mental anguish from those in whom I was interested, only exposed me to the charge of meddling, and ended in all parties, instead of only one, being offended. It had been pressed more than once upon my attention, that, in the most of cases where I had given money, I had only diminished my own resources to protract an inevitable misery in another; where I had smoothed the way for depressed but meritorious individuals, I had only prevented the good of one man, to make it come to another in no respect more deserving of it; and that, let me give favour after favour to any man for a series of years, the refusal of the last, or the least offence to his self-love or his interest at any period of our intercourse, would make him turn and rend me. Gratitude, I found, was little else, when expressed, than the indication of a hope of further favours: it never long survived the cessation of the favours, whether that cessation arose from my own inability to bestow, or from the other party no longer requiring. Men, I found, whose promotion was evidently owing in the first instance to me, were apt in no long time to consider their own merit as the principal, if not sole instrument; and though I or the world might think differently, that was nothing to them. If any one was my debtor in a more express way—namely, for pounds, shillings, and pence—and if I forbore for a long time to mention it. I found that I did not by that means increase either the validity of the debt, or its amount. It might have been pressed at the proper time, and perhaps paid; but the delay, though solely springing from kindness of heart on my part, served only to introduce a question as to its justice, and, what I liked worse, a suspicion of the sincerity of my friendship. In fact, my debtors took it exceedingly ill to be reminded of any of these old obligations, and the common result was, that, in the words of the well-known rhyme, I lost both my money and friend. Again, though I reckoned closely with nobody, every body reckoned closely with me: even the man for whom I had raised large sums by the use of my name, or whom I had otherwise obliged in the most extraordinary way, would exact from me the last farthing of some trifling account, and perhaps complain that I was late in making payment. I once paid upon great urgency a claim of fifty shillings to a man for whom, as he failed next day, I became liable for as many pounds. What was worst of all, I found in many instances, that by doing or attempting to do some service to a person imminently needing it, I became responsible not only for it and for its effects, but for almost the whole of the subsequent fate of the party so assisted; who, in the event of any thing going wrong, though only through his own imprudence, or in pursuance of the usual strain of his unhappy lot, generally blamed me as loudly as if I had voluntarily interfered, or had had some personal interest in doing for him what I did, and been of course duly chargeable with the consequences.

It would be endless to relate all the hints I got as to the absurdity of my course. I saw my folly in a glimmering kind of way; but something more was required to produce a decided change of conduct. I was at length reclaimed by one small particular circumstance. A very near relative had always been treated by me in my characteristic manner. Not being a person of well-regulated mind, he had given me much annoyance throughout many years of intercourse; I had yielded, however, to every petulance, submitted to every reproof, however groundless, and even forgiven injuries in a quarter where the most of men are poignantly sensitive. In fact, this person, though advanced in life, took exactly that advantage of my good nature which my school-fellows had done. He unfortunately buffeted me just a little too much. I was angry, but, being totally unaccustomed to that passion, did not know how to express it. At length, it all at once flashed upon me that the individual in question never took the same liberties with another person who stood in exactly the same relation to him—a person, moreover, who had not been nearly so kind and friendly as I had been. I saw the thing at once. The very sternness and unkindness of that person had procured from the ignoble nature of my tormentor, a respect which nothing else was calculated to procure in such a quarter. My natural sense of justice was roused; pride came to my aid; and, when next subjected to the annoyance, I found myself in such a furor of indignation, as to express my sentiments in a manner very different from what was habitual to me. It is said that the anger of one not given to anger is the most terrible of all. Perhaps there was something in this; perhaps it was only the natural submission of a weak mind, to what it had formerly thought a weaker, but now found a stronger. But, whatever was the reason, the effect was decisive: the annoyance ceased, and for the first time I found what I might call true friendship in an individual, who had never *till now* had reason to be otherwise than friendly.

This incident completely revolutionised my views of human nature. I saw that with the most of minds

fear goes a far greater way than love, and that the one is in some measure necessary to secure and enforce the other. So effectually did the change work, that I got quite reclaimed in a single week. I saw that I had made myself the slave of mankind, and been treated as such, while others who aimed at being tyrants over their fellow-creatures, and had not the tenth of my pretensions to their esteem, were served on the bended knee. I resolved, therefore, since nothing but sternness would do, to be stern also. I ceased to take particular interest in any beyond my own circle, and thus, if I did no good, I was at least sure to do no harm. I would put myself out of my way for nobody but myself, and so was pretty certain to secure the comfort of at least one of the human race. The result has been a marked increase of respect from the world. To be an easy or good-natured man, I now see, only causes the generality to suspect your stability in life, while the very men you benefit are unable to respect that extreme facility by which they have profited. Perpetual suavity, I now find, is not the way to procure any weight for one's word. There must be a fortitude, and even a certain dash of rigour, in one's life and conversation, in order to obtain deference for his opinions. This has been shown in a very marked manner in my case, since I became converted from good nature. My sentiments on almost any subject are now received as of some importance. When I make as if I wished to speak, people make as if they wished to be silent; and I am heard to the very end of what I have to say. I begin to be looked upon as a person very likely to thrive in the world, and one or two mothers of marriageable daughters (the acutest class on earth) have spoken of me, to persons who they knew would tell me again, as a very promising young man. If I by any chance offer to do a service, it is received, not as a right, but as a favour. Whenever I appear in the domestic circle, every one is on the bustle to put me to rights, and serve, and amuse me; if I relent into kindness, it is *felt*, and I am called good, which I never was before. In short, mankind have become my friends and servants, the moment I ceased to be theirs; and I do believe, if I were to add a decided misanthropy to my character, I would soon be reckoned a second Lord Byron.*

POPULAR INFORMATION ON LITERATURE.

THE ITALIAN POETS.

Tasso.

THE sixteenth century produced in Italy several other great poets besides Ariosto. The principal was Torquato Tasso, author of the noble romantic poem entitled "Gerusalemme Liberata" (Jerusalem Delivered), whose misfortunes, however, were fully as remarkable as his genius. Torquato was the son of another poet of no small eminence, named Bernardo Tasso, and was born, March 11, 1544, at Sorrento. He is said to have spoken words at the age of six months, and, at seven years, to have recited compositions of his own, both in prose and verse. In his seventeenth year, he received degrees in canon and civil law at the university of Padua, and, like all the other great bards of Italy, he was fully as much distinguished by his learning as by his poetical talents. His propensity to poetry being much encouraged by his father, he attained distinction in that branch of letters at a very early period of life. In 1564, when only eighteen, he published his poem of Rinaldo, which was in the manner of the Odyssey, and is expressively described as being, though evidently the work of a young man, yet of a young Tasso. In the preceding year, he had composed six cantos of his greater poem, the Jerusalem Delivered, which is universally allowed to be one of the finest productions of the human intellect. When about two-and-twenty years of age, Tasso was taken under the protection of Alphonso the Second, Duke of Ferrara, whose court was then the most magnificent and the most devoted to literature in Italy. Here the poet lived in the highest style at the immediate table of the prince, surrounded by all the brilliant and noble objects which could gladden the spirit of a man devoted to romantic poetry. For some years, his life was one of uninterrupted happiness. His leisure was spent with princes and nobles, who might be considered the most cultivated men of his time; his studious hours were devoted to a species of composition every way according with his taste, and which procured perpetual accessions of new fame. He was, moreover, solaced with the society, and even, it is said, the affection of a princess, the sister of his patron, and described as one of the most accomplished and enchanting women of her time. In the year 1570, he accompanied the Cardinal D'Este, brother of the Prince of Ferrara, to France, where he was received with distinguished honours at the court of Charles the Ninth, who delighted much in the society of literary men, and was in some degree a patron of learning. It is curious to reflect how soon after, a prince thus agreeably brought under our notice—the friend of letters, and capable of appreciating their humanising influence—above all things, the admirer of the noble and pure-minded Tasso—was involved in the atrocities of the Bartholomew massacre! It is related that this modern Nero pardoned, at the entreaty of the Italian minstrel, a culprit of his own profession, to whom all mercy had formerly been refused.

In the year 1573, he brought out his celebrated pastoral drama, entitled "Aminta," and also completed his Jerusalem Delivered, which turned upon one of the most brilliant events of the history of the middle ages, the taking of the Holy City by Godfrey of Boulogne. Several years were afterwards spent in the task, then considered highly important, of correcting and improving his grand work. Copies of parts of it were distributed among his literary friends in various quarters, and he was indefatigable in touching it up according to their advice and directions. Unfortunately, while this process was going on, a part of the poem fell into the hands of a dishonest person, who published it without the author's consent, and in a state which could not but give him great chagrin. His mind was about the same time affected seriously by the rancorous hostility of several of his fellow courtiers, who, though they could not undermine him in the favour of the duke, rendered his life truly miserable. How far an ill-placed attachment entered into his griefs, it is impossible to say; but it is certain, that, in the year 1577, just as he was about to give to the world one of the most splendid effusions of the imagination that it had ever seen, he began to show symptoms of tottering reason; his sun being eclipsed, as it were, at the very height of noon.

His madness took the shape of a fretful and restless fear. He thought he was beset by a host of enemies, who were perpetually seeking to destroy his life and good name. In this state of weakness he made a journey to Bologna, to confess to the Inquisition that he had once been guilty of holding heretical opinions, and to subject himself to whatever punishment that court might think proper to award. He was acquitted; but, still unconvinced of his own innocence, he applied again, and it was not till a second review of his conduct, and a second absolution, that he was satisfied. In June 1577, having made an attempt upon the life of a servant, in the apartment of the Duchess of Urbino, he was put into confinement by his patron Alphonso, but soon after released, and apparently restored to favour and also to health.

The immediately ensuing part of Tasso's history is the subject of much controversy. He is said to have at length tired out Alphonso with his feverish complaints about supposed enemies, and to have been sternly forbidden by that prince to write to him any more. More alarmed than ever for his personal safety, the poet immediately fled on foot to Naples, and placed himself under the protection of his sister Cornelia, who was married there. Being assured of continued protection at Ferrara, he soon afterwards ventured back, but was disappointed in his hopes, probably in consequence of his own conduct, which was so full of fretfulness and reproach as to be highly disagreeable to the duke. He again fled in a state of alarm, and wandered for some months through the north of Italy. Arriving on one occasion at the gates of Turin, he was so tattered and forlorn in his appearance as to be refused entrance by the guard. The man, however, who was thus sunk so low in wretchedness, required only to mention that he was Tasso, in order to be conveyed to the palaces of nobles and princes, and clothed and fed as sumptuously as one of themselves. After a certain interval, finding he could be happy nowhere but in Ferrara, for which city he seems to have borne a sincere affection, he made such interest with the duke as to be permitted to return, on condition that he would submit himself to a course of medicine, and be careful of his conduct for the future. He returned in February 1579, was treated with less consideration than he expected, and at length, his feelings getting the better of his prudence, he broke out upon his former patron in a tide of satire and reproach, which sealed his fate at the court of Ferrara. In the course of the ensuing month, he was immured, by the directions of the duke, in the Hospital of St Anna, a receptacle for lunatics, where he was put under such a severe regimen as materially aggravated his mental distemper. How far the conduct of the duke was the result of personal resentment, and how far dictated by the humane spirit which every day causes the removal of deranged persons from society to solitude, it is impossible to say. If it was an experiment for the recovery of Tasso, it was an eminently unsuccessful one. For several days after finding himself in confinement, the unhappy poet continued in a state of perfect stupor. On recovering consciousness, his misery was only increased. He shrunk with horror from the squalor and solitude of his dungeon, and abandoned all his former hopes of poetical renown for a moping despair. "My mind," said he in a letter to a friend, "becomes slow of thought, my fancy indolent in imagining, my senses negligent in ministering to them images of things; my hand refuses to write, and my pen even to execute its office. I seem, indeed, to be frozen, and am oppressed by stupor and giddiness in all I attempt to do."

While Tasso was in this lamentable state, his poem of Jerusalem Delivered was published surreptitiously in several of the Italian states, so as to deprive him of all prospect of profit from what had been the labour of nearly twenty years. It immediately became famous over Europe, and was every where received with admiration. Strange that the mind which had produced this noble work, should now be lying in ruins within the cell of a wretched hospital, cut off from all experience of those honours which were so profusely heaped upon his name. "We chill with terror," says Mr Stebbing, "as we hear him pathetically lament in one of his letters, that he was prevented from writing by the constant shrieks of the poor maniacs whose cells adjoined his own; that he was left to the mercy of the keeper and the creatures of the court, who attended to none of his wants though he was so sick and feeble; and that, while the publishers of his poem had gained three thousand ducats by its sale, they had none of them given him a single scudo."

The confinement of Tasso lasted above seven years, and his mind seems to have been completely weakened by so long a period of unalleviated misery. His disease originally was nothing but what would now be termed a nervish irritability, and what a soothing treatment might have been expected soon to remove. But he came out a perfect visionary, and, though still quite gentle and harmless, the finer powers of his intellect were gone, and nothing but a shell, as it were, left behind. He owed his release to the intercession of Don Cæsare d'Este with the Duke of Ferrara, and to the Duke of Mantua, who became surety that his highness should suffer nothing from the poet's pen.

The few remaining years of his life were spent under the patronage of various individuals, with all of whom he seems to have quarrelled sooner or later; and he was accordingly reduced on several occasions to a condition little superior to that of a wandering mendicant. As formerly, however, he was never in so low a state, but what could be changed in an instant for the summit of honour and comfort by his simply mentioning who he was. On his arriving at any new place, and taking up his abode with any of the citizens, people were invited to come and see him as an object of wonder. While he passed along the streets, those who met him exclaimed, "See, that is Tasso!"—an exclamation that might well be prompted by the unusually tall and majestic figure of the poet, by his pale and thoughtful countenance, and the somewhat wild expression of his blue, lustrous eye. During this period, he composed his "Gerusalemme Conquisata," and a poem on creation, styled "Sette Giornate del Monde Creato;" but neither of these works has attained the celebrity of his "Gerusalemme Liberata." After a life singularly chequered by good and evil fortune, he retired to die in the monastery of St Severino, near Naples, where he expired on the 25th of April 1595, aged only fifty-one years, but completely worn out with mental and bodily sufferings. His body was interred in the church of the monastery, under a plain slab, inscribed with the epitaph so famous for its majestic simplicity, "Hic jacet Torquatus Tassus," "Here lies Torquato Tasso."

We shall conclude this memoir with an extract from the elegant and entertaining work to which we have already been so much indebted:—"Of the mind which produced them," says Mr Stebbing, in allusion to the works of Tasso, "it may be said that it was endowed with those higher powers which give sublimity to thought, while it was subject to all those milder influences of the feelings which keep it constantly within the verge of what is human, or of human interest. In the Gerusalemme, we trace that harmony of design which is the result only of pure intellect, disembarrassing itself of whatever hinders its orderly operation. In the Gerusalemme, we perceive the influence of that noble moral feeling which constitutes the distinction between the poetry of times and seasons, and that which lives, and of which the power and majesty are felt, through all ages; and in the Gerusalemme, we see those various representations of human character, and those bold inventions which, together with the before-mentioned qualities, raise the epic poem above every other species of composition, appealing as it does to the sublimest attributes of our nature, and furnishing the mind with new food for the elevated emotions to which the verse of the poet gives birth."

THE BASTILE,

A PARISIAN TALE.

"IT must come down!" exclaimed Julian; "Frenchmen will no longer endure it. What's a man's life worth without security of person and property? I may possess health, I may possess honesty, I may be blessed with wife and children, my affairs may thrive, I may have friends on every side of me, and yet may end my days in a dungeon, if I happen to displease a man in power. It must come down!"

"What must come down?" demanded Monsieur le Croix, suddenly entering the apartment; "what must come down?" repeated he, in a still more authoritative tone.

"The Bastile," replied Julian, calmly raising his eyes, which at first he had dropped, and fixing them steadily, but respectfully, upon his master. There was a pause.

"Julian," at length said Monsieur le Croix, "I have heard of this before. Do you know that you are talking treason?"

"Yes," replied Julian, rather doggedly; "but I also know that I am talking reason and justice."

"That is, *as you conceive*," rejoined Monsieur le Croix. He took a turn or two across the apartment. "Julian," resumed he, "you are a dissatisfied man, and there are too many such in France. You are a dangerous man, too; for you read, and talk of what you read, and unsettle the opinions of those who know

* It is necessary to mention, that the idea and several of the expressions of this article are to be found in a paper which appeared some time ago in the periodical work entitled the *Athenæum*.

less than you do; you are tainted with that feeling of jealousy and rancour, with which Frenchmen unhappily begin to regard the established and venerable institutions of their country. How came it that you treated with insolence, to-day, the valet of Monsieur le Comte de St Ange?"

"Because he treated me with insolence," answered Julian; "he called to me to hold his horse while he alighted, as though I had been his master's groom!"

"Was it not rather because his master is a nobleman?" sternly interrogated Monsieur le Croix.—"You have been insolent to the count, too," resumed he.

"He threatened to apply his whip to my shoulders," said Julian, "and I told him that he had better reserve it for his horse."

"And had he put his threat into execution, what would you have done?" Julian was silent.

"I command you to answer me!" impatiently exclaimed the former. "What would you have done, had the count struck you?"

"Struck him again," indignantly vociferated Julian, "though my hand had been cut off the very next moment."

"And you think the count was afraid of you?" said Monsieur le Croix. "The count afraid of you! Do you know the power of the count?"

"I do," replied Julian, "and the character of the count. He is not fitted to be admitted into an honest man's family. He is the most dissolute young nobleman in Paris." "Dare you say so?"

"He is a libertine, sir! I can prove it! What then should prevent me from saying it?"

"Respect to me," said Monsieur le Croix. "Julian, you quit my service," added he. "Very well."

"You quit it to-night!"

"This minute!" exclaimed Julian, walking coolly to the other side of the apartment, and taking his hat from a peg on which it had been hung. "Good bye, sir," said he; but he stopped as he was going out of the door, and turning, stood and fixed his eyes full upon Monsieur le Croix—"I have been a faithful servant to you, sir," resumed Julian.

"Stay," said his master. "You have lived with me eight years. You *have* been a faithful servant to me—up to this moment. But you are a dangerous *subject*. You have begun to think for yourself—to question the rights of your betters—to make light of the distance which stands between them and you. Because a nobleman happens to lose his temper, you put yourself upon an equal footing with him—you give him word for word, and *would* give him blow for blow—and in your master's house!" Monsieur le Croix took a purse from his pocket. "I settled with you this morning," continued he, "and thought we had commenced another year; that's out of the question now. Here, Julian, there are eight louis d'ors in this purse; take them for your fidelity. Better to reward it now, and stop, than go on, and have reason to reproach it." Julian mechanically took the purse, but still kept extended the hand which he had reached to receive it, looking his master all the while in the face.

"You think, if I continued to serve you," said Julian, "that I might prove unfaithful to you?"

"Your principles are undermined in other matters," remarked Monsieur le Croix.

"And you think they could be undermined with respect to you?"

"When a part of a foundation gives way," observed Monsieur le Croix, "there is danger of the whole."

"And your confidence in my fidelity is shaken?"

"It is," said Monsieur le Croix.

Julian, whose colour had been gradually mounting as he spoke, stood silent for half a minute, without once withdrawing his eyes from his master's face. At length he broke silence. "It is?" echoed he.

"It is," calmly repeated Monsieur le Croix.

"Then perish your gold!" exclaimed Julian, dashing the purse on the ground, and rushing from the apartment.

Monsieur le Croix was an advocate for the old *regime*. He believed that, like the sun, it fitted the world now, as well as in the beginning—never taking into consideration the difference between the Creator of the one, and the framer of the other. He was at the same time a disinterested, conscientious, generous, and honourable man. He was handsome, too, and of a graceful commanding figure, though now in his fiftieth year. He was married, and, strange to say, the object of a still ardent and devoted attachment to a wife who was nearly twenty years younger than himself. Women are capable of such love. He had entered his fortieth year when his Adelaide had completed her twentieth one. From particular causes they were frequently thrown into one another's society, and the more intimate they became, the more coldly did Adelaide look upon many a youthful admirer who was a suitor for her hand. This was attributed to absorption in the prosecution of various studies, to which Monsieur le Croix had directed her attention; until the increasing pensiveness of the fair one too plainly indicated an occupation of the heart, far more active and intense than any of the mind could be. Monsieur le Croix was interested. He soon detected within him symptoms of the first genuine passion he had ever felt, but not before he was too much fascinated to struggle successfully with wishes, which, from excessive disparity of years, he at once concluded must be hopeless. Little did he dream of his good fortune: it came upon him like the arrival of a rich inheritance to one who had lived in penury, and always thought to die so. He entered his Adelaide's boudoir one day when she was so deeply absorbed that she did not perceive him. She was seated at a table with her back towards him, and she held in her hand something which she alternately gazed upon and pressed to her lips. Unconscious of the act of treachery which he was committing, he advanced on tip-toe a step or two—'Twas a miniature!—a step or two nearer—'Twas his own! He could not suppress his emotions; he clasped his hands in an ecstacy of transport. She started up; and turning, shrieked at beholding him. He extended his arms, and she threw herself into them. In a month she became Madame le Croix. A son, their only issue, blessed their union. He was now nearly nine years old—a promising boy, whose sole instructors were, hitherto, his father and mother—as by preference, as well as full contentment in each other's society, they always resided in the country; receiving occasionally the visits of their Paris friends, among whom was reckoned Monsieur le Comte de St Ange.

Monsieur le Croix felt too much discomposed to rejoin immediately his wife and the count. He turned into his study—"Julian is ruined!" exclaimed he to himself. "I am sorry for him; but there is no help for it. The moment one of his order begins to dispute, or even to examine the claims of those above him to his respect, he is fit for nothing but mischief, and, sooner or later, will think of nothing else. Not hesitate to strike the count!"

"Papa!" cried little Eugene, running into the room, "you are wanted."

"Who wants me?" inquired Monsieur le Croix.

"My mother." "Did she send you for me?" "No."

"Why did you come, then, and what do you mean?"

"She threatened the count to call you."

Monsieur le Croix started from the chair, into which, upon entering the room, he had thrown himself, and stared upon his son.

As he was rushing up stairs, he heard a scuffling in the room, and then a noise. Frantic with conjecture, alarm, and indignation, he rushed in, his hand upon his sword. The count was stretched upon the floor; Julian was standing over him with rage and triumph painted in his looks; and on a chair reclined Madam le Croix, half swooning.

"Rise, villain, and defend yourself!" vociferated Monsieur le Croix: but the count was either unable to rise, or pretended to be so. The room was presently filled with domestics, the count's attendants among the rest, who, obeying the signs of their lord, raised him, and conveyed him to his carriage.

* * * *

"His life shall answer for it!" exclaimed Monsieur le Croix, pacing the room, after his wife, upon being left alone with him, had acquainted him with the insult which the count had offered to her.

"He has been punished sufficiently," said Madame le Croix; "thanks to the brave and faithful Julian."

"Where is Julian?" exclaimed her husband. The bell was rung and answered. Julian was on his way to Paris. He had gone by the diligence, which at this hour every evening regularly passed the gate of the chateau.

* * * *

"A lovely sunset!" exclaimed Madame le Croix, sitting beside her husband, at a window which looked to the west, her head reclining upon his breast, and her little boy on the other side of him; "a lovely sunset!"

"Yes," replied he, "though its beauty is waning fast. The moon, however, will soon be up. Come, throw on your shawl, and let us take a stroll in the grounds." Madame le Croix caught her husband's hand as she rose, and looked up anxiously in his face.

"You are afraid of the stranger whom for the last three nights they have observed about the grounds," said Monsieur le Croix. "What harm have we to apprehend from him?"

"What brings him here, and at night?"

"What mischief can he do, and alone?"

"He may have associates, who are at hand," said Madame le Croix, after a pause. "Did you not part in anger with Julian?" added she.

"Do you think 'tis Julian?" asked M. le Croix.

"Would you be uneasy if it was?" inquired his wife. "I should almost think so, from the tone in which you speak."

"He has taken up with companions, I fear," said Monsieur le Croix, "who are not very scrupulous in the respect which they pay to the laws—some of those vile bands of republicans who have given rise to the recent ferments in Paris, and caused so much alarm to the court. Do you think it is he?"

"Jacqueline thinks so," replied Madame, in a whisper. At that moment a heavy and hurried step was heard in the passage, the door was burst open, and Julian stood before them! Madame le Croix shrieked, her husband half drew his sword, and the little Eugene instinctively sprang forward, and clasped Julian round the knees.—The man had been always particularly fond of the boy.

"Conceal yourself, sir," cried Julian; "they are here!" "Conceal myself from the bandits of Paris!" ejaculated le Croix; "I'll perish first!"

"From the executioners of the Bastile!" rejoined Julian. "What!" exclaimed Le Croix. Several steps were heard ascending the staircase.

"They are here!" cried Julian despondingly; "for these three nights I have been expecting them, and hoped to have time to give you warning; but they have taken me by surprise, and you are lost!" The door, which Julian had shut after him, was rudely opened, and a band of armed men entered the apartment. Madame le Croix threw her arms about her husband, while the little boy, quitting Julian, ran back to his father, and caught him by the hand.

"Your business?" haughtily demanded Le Croix.

"Your company!" replied the leader, whose sword was drawn. "Your authority?"

"A lettre-de-cachet!" Imagine the conclusion of the scene. That night Monsieur le Croix slept in the Bastile.

* * * *

He fancied it was morning—not a blink of day was admitted to announce to him the coming or the going of the sun. He rose, and after taking a turn or two of his dungeon—with the dimensions of which an acquaintance of now three weeks had made him familiar—he sat down upon the side of the bed, his frame still vibrating with the effects of his dream. He could have wept, was it not for the presence of his own dignity. He started at the call of a sensation which warned him that the hour of his morning's repast had gone by. He listened—not the whisper of a footstep! "To be starved to death in prison! Such a thing had occurred, and might occur again! Heaven! for an innocent man to be placed, by arbitrary power, in a predicament which would extract compassion for the most guilty one!" He paced his dungeon again. "What was intended?" He leaned against the wall, at the damp and chill of which he shivered, as they struck to his heart. He listened again—"did he not hear something? No!" He resumed his walk. "His wife and child unprotected!—ignorant whether he was alive or dead! A kingdom upon the verge of a convulsion! A people broke loose and wild! Rapine! Murder!—Houses in flames!—All the combustion and havoc of a civil war!" He threw himself upon his pallet. "Well! he was entombed in the Bastile. The moral earthquake might shake the foundations of his prison, and throw down its walls and set him free!" The walls—the very earth on which he stood—began to shake! He sprang upon his feet. "Was it thunder that he heard above him, or the play of cannon?" He could almost hear his heart throb! Shock now followed shock incessantly, and with increasing violence. "Was the Bastile beset? It was!" He thought he could catch the sound of human tumult! He threw himself upon his knees in supplication, imploring heaven to strengthen the hands of the assailants! He could now distinctly, though faintly, hear the shouts of an immense multitude of people—and presently, all was comparatively still. "The Bastile has surrendered," exclaimed Monsieur le Croix, "or the military have overpowered the people!" He heard the sound of bolts withdrawing, and doors flung violently open—presently, of voices, numerous, loud, and confused, as of men in high excitation. He clasped his hands convulsively, he stirred not, he scarcely breathed! Footsteps were rapidly approaching, traversing the intricate passages of the underground portion of the prison. A ray of light shot through the key-hole of his dungeon door. "Merciful Providence!" The broadest, brightest sunbeam he had ever gazed upon, had not a thousandth part the glory of that little ray. The bolts flew!—the lock!—the hand of liberty swung, light as a feather, the massive door back upon its hinges—The vision of Monsieur le Croix was drowned in a flood of light from the torches of his liberators. He could scarcely distinguish the figure of Julian, who, rushing forward, and clasping his almost insensible master in his arms, exclaimed, or rather shrieked—"'Tis DOWN!—THE BASTILE IS DOWN!"*

FISHING VILLAGES—BUCKHAVEN.

THE fishing villages scattered along our coast, add not a little to the yearly creation of property in the country, and have always been reckoned as affording in the aggregate a most important source of national wealth. In their individual character, however, they are viewed very differently; few have the curiosity to make inquiries into the condition of our *fishermen*, however much they may prize the value of our *fisheries*; and a most useful class of men are passed by with a sneer of neglect, which they very little merit. A short notice concerning some of these interesting and industrious people, may correct certain erroneous ideas which have been taken up hastily concerning them as a body, besides attracting attention to those in remote stations, to whom improvement and moral culture has not yet penetrated.

Buckhaven, on the coast of Fife, is one of the most remarkable of our fishing towns: till of late years it was occupied exclusively by fishermen; but, from the facilities afforded by the proprietor for building, there has lately been added to it on the west a kind of suburb, which is tenanted by working people of all trades.

* From the "Magdalen and other Tales," by James Sheridan Knowles. London, Moxon, New Bond Street. 1832

These, however, have no place in the fishing town itself, which consists of buildings, situated one above another, on the face of a rocky eminence, dipping into the sea. The lower and front houses are built on the edge of the rocks, a very little above high water mark, sometimes in little rows, with a footpath and parapet wall in front, but as often standing ranged with their gables to the sea. The whole, both those on the water's edge and those which overlook them on the ascent above, are closely crowded together, and set down without any kind of order; so that there is no where such a thing as a thoroughfare from one part of the village to another, except by scrambling through narrow dirty lanes, and up stairs as dark and steep as any recollected by the oldest caddie in Edinburgh. This inconvenience has arisen from the scantiness of the ground originally allotted to the people, who were necessitated on that account to occupy every site on which a house could stand. The appearance of the old-fashioned village, on the front of its sloping headland, has a romantic effect from the water, which adds not a little to the interest of a steam-boat voyage along the coast of Fife.

The inhabitants of the village are remarkable for their industrious and steady habits; a sufficient proof of which is afforded by the capital which they have accumulated for the purposes of their business, and which, as far as we can learn, is entirely their own. There are about one hundred and fifty-six fishermen, heads or representatives of families, who are owners of the whole property of the village: the value of that part of it which is employed as *capital* in the fishing, is not less than L.16,000 or L.17,000, giving more than L.100, on this head merely, for the share of each family. Some have less, and some a great deal more than this amount; but none are without some share; neither is there any one who has not a number of shares, or a number of boats, to be let out to others who have none. Their interest in the fishing apparatus is of course independent of what may be called their unproductive capital—in clothes, furniture, specie, houses, &c. In the article of furniture, they are at considerable expense, not considering their dwellings even decently furnished (*neighbour-like*), without a neat oaken table, and chairs, good beds, chests of drawers, an eight-day clock, and a large well-bound quarto bible. These are to be found in every house, even those which seem most unpromising on the exterior.

The fishermen have different occupations according to the season of the year. About the middle of July, the stoutest and most active of their number depart for the herring fishing on the north coast. Buckhaven sends yearly sixty-two boats to this harvest, each of them about fourteen tons, and requiring from L.180 to L.200 to fit them for sea—in masts, cordage, sails, anchors, and nets, in which last item consists nearly half the outlay. They have each five men, who are all generally partners in the adventure. Each boat is under an engagement to some merchant, to furnish a certain number of crans or barrels of herrings (about two hundred and fifty), for which they received last year 10s. per cran. The proceeds are divided into shares; one-fifth part being allotted for upholding the boat and stores, while the rest is divided in equal portions among the men. Sometimes, however, landsmen are engaged, merely on wages, by the owners of the boat. The fishermen are generally absent on the North Sea fishing about six weeks or two months, departing about the middle of July, and being generally home in the early part of September. They take hammocks and bedding with them, which, together with the clothes necessary for their exposed occupation, render the outfit of the men very expensive.

While the younger fishermen are absent in the north, the old men and boys do the best they can to supply the markets with haddocks, cod, flounders, &c. from the line-fishing at home. They are not able to venture out to sea to the best fishing ground; but the small quantity caught is generally compensated by the high prices they fetch in the absence of a fuller supply. The Buckhaven fish are at this season carried off every morning by certain fishmongers of female appearance, from Leith, who come the day before, in order to make sure of a purchase; and the bustle, grotesque dresses, and odd terms, of their hurried market, amid the rocks and fishing-boats of the little haven, present a most amusing spectacle to strangers.

When the able fishermen return in September, they betake themselves immediately to the line-fishing off the Dogger Bank and the Red Head, which may be considered as forming the staple industry of the village. The boats set sail in the afternoon, and have a distance of at least fifty miles to make before casting their lines; they remain at sea generally two nights, and till the afternoon of the third day; and on their return they proceed immediately to Leith to dispose of their cargoes. Two trips of this kind are made in the week; while the intervals are busily employed in necessary preparations and repairs for again going to sea. All hands are set to work to clear the lines of the sea-weed and old bait, repair the damage done by dog-fish, supply new hooks, &c. The men have also to inspect their boats, look after the tear and wear of sails and cordage; and, lastly, the lines are all to be baited anew. This is an operation which requires a greater number of different processes than the making of a pin—none of which we can describe at present; dexterity in performing them, however, is one of the highest accomplishments of a fisherman's bride. This work is all done in the open air before the doors of their houses, and generally occupies the whole family; those whose aid is not required are employed in *braiding* (weaving) nets, which they do for one another, according as there are spare hands, at sixpence per yard. No creature above twelve years of age is left unemployed in the family of a fisherman.

From November till the middle of February is the time of the winter-herring fishing, and is a peculiarly busy season, as the cod-fishing is attended to at the same time. A different set of boats and nets are necessary here from those employed in the North Sea. From February till July, the men are again employed in the line or deep-sea fishing, for the supply of the daily markets.

It would be difficult to estimate the average yearly returns of the fishing, from the shifting of prices, and the variable quantities of fish caught in successive years. But, last season at Wick, each boat furnished 250 crans of herrings, at 10s. per cran, which gives an amount of L.7750 for the whole sixty-two boats.

The winter herring-fishing in the Frith of Forth is reckoned to produce about three-fourths of that of the North Sea in August, and may therefore be estimated at L.5800.

The produce of the six months devoted to the line-fishing may be guessed at from the following considerations:—The weekly *take* of fish, according to the best average which some of the old fishermen could form, is about 60,000; and these are sold according to their quality and the state of the markets in Leith, at prices varying from 3s. 6d. to 12s. per hundred. The average is reckoned about 7s. per hundred, so that the weekly produce may be estimated at L.210; and that for the whole six months, at L.5460; a tenth part may be added for the fish caught by the older fishermen, which will give the whole amount of the line-fishing about L.6006.

The whole proceeds of the fishermen's labour may therefore be estimated at L.19,550 annually.

Their expenses during the same period consist in upholding boats, nets, and fishing-lines, and in the purchase of bait, hooks, and other requisite articles. Their own calculation is, that a fifth part of the gross proceeds is absorbed by the expenses of the boats and boats' stores, such as sails, cordage, anchors, spars, &c.; and in their trips to the North Sea, that proportion is always set apart for this purpose. The upholding of their nets is a very expensive matter; each boat, on going to the herring fishing, requires to have twenty of these, at a cost of L.4, or L.4, 10s., each, and lasting perhaps four or five years only. When in use, it is necessary to boil them regularly every few weeks in a ley of oak bark (called *wis* or *wash*), by which process they are found to dry more readily after being immersed in the salt water, and are prevented from becoming soft and flaxy.* The bark wanted for this purpose costs the village about L.500 yearly.

This industrious community are put to great inconvenience and loss from the want of some pier or landing place near their village. At present they have not the smallest shelter for their boats, except an open roadstead, and are therefore obliged to leave much valuable property exposed to all the chances of the seas and winds.

The inhabitants of Buckhaven have some peculiarities which have been much spoken of.† The most singular is, that, among one hundred and sixty families in the fishing village, there are only about a dozen *surnames*. There are seventy-one families of Thomsons (or more properly *Tamsens*); nineteen of Deases; fifteen of Logies; of Robertsons and Walkers, nine each; six of Bonthrons; of Taylors, Eassons, and Wanenders, four each; besides one or two Murrays and Johnstons. Among so many individuals of one name as must exist in a community so sparing in appellatives, it would be impossible, without some additional aid, to distinguish one from another; and, accordingly, most of the inhabitants have what are called *slog-names*, or *styles* by which they are designated. These are never looked on as matter of offence, though some of them are sufficiently whimsical. One person is called *Fancy;* another, *Black Harry;* one is *Caledonian*, one *Rose*, one *Laird*, and so forth; and these styles are used on post letters, and even in law-papers—as "Henry Thomson, commonly called *Black Harry*."

It does not appear that the occupations of fishing are very favourable to long life. Hardly any individuals are found in the village above the age of eighty; and when it is considered, that, while out at sea, they are during one part of the time kept in continued exertion and perspiration, while during the other they must remain in a state of inaction (waiting for the filling of their lines), and exposed to the weather in an open boat, it cannot be wondered that their labour is exhausting.

The inhabitants of fishing villages are often considered as reckless and improvident. Those of Buckhaven merit a very different character: a more industrious and economical community does not exist. They are all neatly and comfortably clad in their own fashion, have well furnished houses, and none of them can be thrown into a state of destitution by the result of an unsuccessful season, as is too often the case elsewhere. The readiness and courtesy of their answers to strangers inquiring rationally concerning the affairs of their village, is as remarkable as the contempt they evince towards those who think that their purse or their dress entitles them to quiz a fisherman's jacket.

There is a subscription school belonging to the village, with about 120 scholars, who generally remain at school till about twelve years of age. Much care is exerted in selecting a diligent teacher, and the children are orderly, well dressed, and attentive. A second school has about 80 scholars; the whole number of inhabitants in the village and dependencies is about 1600. There is a dissenting chapel, supported, of course, by the people; and a small but properly selected library has been formed by subscribers of the congregation, not including, however, many of the fishers. There are few newspapers, or other periodical publications, read among the fishermen; and they hardly indeed purchase books of any description except the Bible—their laborious avocations leaving but small leisure for reading. On Sunday morning the village presents an agreeable picture of stillness; the old people are stepping early and slowly to church; no bustle, no noise any where; the dash of the ebbing and flowing tide, which at other times is the accompaniment of hurry and preparation among the fishermen, now sounds idly on the rocks; and the boats and pinnaces lie untenanted, even by the children, who use to hold their play about them on work days.

The original inhabitants of Buckhaven are supposed to have been one or two Norwegian families who settled there at an early period. This tradition is supported by the testimony of Mr R. Bonthron, one of the most respectable inhabitants of the place, who recollects, that, in his youth, the older fishermen used to call the *yard* (on the mast) the ray, and employed the term *babord* for *larboard*. These words correspond with the Danish and Norwegian *raa*, yard; and *bagbord*, larboard. The words *raa* and *basbord* are also German, it is true; but when the correspondence of terms is taken along with the traditions of the place, there seems little doubt that the colony was originally Norwegian.

* This is a process of long-tried efficacy among fishermen, but of which chemistry affords as yet no explanation. The effect of the *tannin*, procured from bark, in converting hides into leather, is well understood; but how the same substance operates to make the twisted fibres of hemp dry sooner after being dipped in salt water, remains quite unknown. We can only suppose (which chemists may easily ascertain by experiment) that *tannin* refuses to combine with the salt, which would, if absorbed, prevent the meshes from drying.

† This village has obtained a kind of absurd notoriety from a penny pamphlet, usually sold along with the *History of George Buchanan*. The latter represents the venerable translator of the Psalms, and historian of Scotland, as a merry rogue and buffoon at the court of King James; and its companion vends other stories of the same authenticity concerning Buckhaven.

THE WESTERN STATES OF AMERICA.

WEST PENNSYLVANIA.

In advancing westwards from those states of the Union which border on the Atlantic, and which have been described as little else than the portico to this great confederated republic, and after crossing the ridges of the Alleghany mountains, the first territory that presents itself to the choice of the settler in the extensive vale of the Mississippi, is what is called West Pennsylvania, which is a distinct portion of the Atlantic state of Pennsylvania, and contains many spots worthy of the notice of emigrants. The highest peaks of the Alleghanies are elevated from 2000 to 3000 feet above the level of their bases. This region, in its mountains, vallies, and cascades, presents all varieties of the grand, rugged, sheltered, and romantic in scenery. Iron in vast quantities, lead, and a variety of coal, marble, freestone, and all the useful earths for building and the arts, abound in this state, so variegated in surface, and of geological formations differing widely in character. All parts of the western country seem admirably accommodated the one to the other; the one part supplying what the other wants. Those who intend to live by farming, should not locate on or about the Alleghanies, but pursue their way to a more genial district.

West from the mountains, the land is composed of hill, dale, and plain, and the soil of the vallies is almost invariably fertile. A portion of this region inclines towards Lake Erie on the north; and here the ground is level, and adapted for agricultural purposes. West Pennsylvania, which is watered by the Ohio and its tributaries, contains considerably more than 200,000 inhabitants, who are generally a hardy, robust, and industrious race. The chief town in this district of country is Pittsburg, to which, as we have elsewhere mentioned, nearly all immigrants who proceed this way direct themselves as to a centreing point. Pittsburg, which is the greatest of the manufacturing towns in western America, is situated upon a point of land formed by the junction of the Alleghany and Monongahela rivers, the former flowing from the north-east, and the latter from the south-west. The waters thus joined form the Ohio river. A more charming spot for the site of a city could scarcely be selected. No place is surrounded by more

charmingly rounded and romantic hills. The boundless view of hill and dale—of the conjunction of two fine rivers—the broad and beautiful Ohio, calmly commencing its course of 1000 miles, and winding away among its deep forests and shores, shaded by noble sycamores—the town—its surrounding vallies—and, indeed, the whole scene taken together, as seen from the adjoining hills, constitutes as fine a landscape as can well be imagined. Over the Alleghany river is a high and beautiful plain, bounded in the distance by rugged hills. The coal-hill across the Monongahela rises more than three hundred feet. On this side is a manufacturing village, called Birmingham; and on the Alleghany side another town, called Manchester.

The town of Pittsburg is compactly, and in some streets, handsomely built, although the use of pit coal for culinary and manufacturing purposes has carried such quantities of fine black matter, driven off in the smoke into the air, and deposited it on the walls of the houses, and every thing that can be blackened with coal-smoke, as to have given the place a gloomy aspect. Its excellent position, and other advantages, as a manufacturing and trading town, and its acknowledged healthfulness, will continue, however, to render it a place of attraction for builders, manufacturers, and capitalists. At present the following articles are manufactured on a great scale in this thriving city:—Ironmongery of every description; steam-engines, and enginery, and ironwork in general; cutlery of all descriptions; glass and paper; cotton and woollens; pottery; chemicals; tin and copper ware; and which are all exported to a great extent. There are steam flour-mills, carding and spinning-mills, iron-mills, distilleries, breweries, brick-yards, air-furnaces, lead-factories, naileries, gun-smitheries, tobacco-factories, tanneries, with establishments of all the ordinary trades.

Ship and steam-boat building has been pursued here on a greater scale than in any other town in the western country, although the town is situated about 2000 miles from the sea. So long ago as 1814, upwards of four thousand waggons, of four and six horses, employed as transport carriages, passed between this place and Philadelphia. Boats of the smaller kinds are continually departing down the river, for places on the Mississippi, the Missouri, and other large rivers communicating with the Ohio, and for New Orleans, near the sea-coast; and there also depart from Pittsburg, although a remote inland town, merchant vessels, loaded with goods for ports in different parts of Europe. Respecting the shipping business of this place, Mr Clay made the following relation, in one of his speeches a few years ago in Congress, and which, though noticed in most books of travels in the western states, may here be noticed once more:—"To illustrate (said he) the commercial habits and enterprise of the American people, he would relate an anecdote of a vessel, built and cleared out at Pittsburg for Leghorn. When she arrived at her place of destination, the master presented his papers to the customhouse officer, who would not credit them, and said to the master, 'Sir, your papers are forged! there is no such place as Pittsburg in the world! Your vessel must be confiscated!' The trembling captain laid before the officer a map of the United States—directed him to the Gulf of Mexico—pointed out the mouth of the Mississippi—led him 1000 miles up it to the mouth of the Ohio, and thence another 1000 to Pittsburg. 'There, sir, is the port whence my vessel cleared out.' The astonished officer, before he saw the map, would as soon have believed that this ship had been navigated from the moon."

A large amount of commission business is also transacted at Pittsburg. Great contracts are continually ordered from all the towns on the Ohio and Mississippi, for machinery, steam-boat castings, and the various manufactures that this city supplies. The inexhaustible mines of excellent pit-coal, in all directions in the coal-hills about the town, furnish great facilities for keeping in operation the great number of steam-manufactories. The coal costs little more than the simple expense of digging, and there is no fear that the supply will either fail or become difficult to procure. The possession of coal here is of immense consequence to the prosperity of the United States. The coal in the British possessions being the property of the crown, and therefore liable to troublesome embargoes—as, for instance, the coal-mines of Nova Scotia, which, we understand, have been given to the late Duke of York's creditors for a long series of years, to help to pay his royal highness's debts—the states cannot be supplied from thence on sufficiently advantageous terms for all purposes. The present amount of the value of manufactures in Pittsburg is supposed to be 2,500,000 dollars annually. The market is rich and abundant, but much higher than in the towns lower down the Ohio. We presume it would be a proper place for the reception and furnishing of employment to industrious artizans in those branches of manufacture above mentioned; and failing an engagement here, the emigrant might easily proceed down the Ohio to Cincinnati, another manufacturing town of considerable importance. The excellence of Pittsburg as a place of settlement for artizans, is noticed by our invaluable authority, Timothy Flint. Speaking of the inhabitants, he says, "they are a mixture of all nations; Germans and Irish predominate; but there are great numbers of English, Scotch, French, and Swiss. *Mechanics and artizans who come here bring their mechanical skill and industry to a better market than they could find in the Old World.*" The habits of the people of the place are those of persevering industry, calculating carefulness, distrust of strangers, and a fixed purpose to look to their individual interests. They are of all the different denominations of religion, and as moral as could be expected of a people so situated. Luxury, splendour, and display, are not much in fashion here; and the habits of all the people are frugal and economical. This city has immense advantages of artificial as well as natural water communications. The great Pennsylvania canal, above 500 miles in length, terminates here; another canal is laid out to connect it with Lake Erie through Meadville; and still a third is proposed to the mouth of Mahoning, where it will connect with a branch of the Ohio and Erie canal from its summit head. Pittsburg is the seat of justice for the county of Alleghany, and is situated at the 40th degree of north latitude, at the distance of 300 miles north-west from Philadelphia.

As the information in this article is chiefly directed to artizans or others of the working classes who design to seek employment in the manufacturing towns of America, we beg to subjoin the recommendation to them of taking care to bring with them certificates of character, which they will not do well without, as may be learned by the following circumstance, narrated by Mr Stuart in his Travels in the United States:—

"I had not been long (says he) at Mr Anderson's [a farmer in Long Island, near New York], when I was applied to by a good-looking young man, from the west of Fifeshire, in Scotland, whose name was John Boswell, to give him, or procure for him, a letter of recommendation to a ship-builder in New York. I had never seen him before, so far as I knew; but I had been acquainted with his father, a very respectable person in his line, a farm overseer to the late Mr Mutter of Annfield, near Dunfermline. Boswell's story was this:—He had been bred a ship-carpenter, had married, and was the father of two children. Finding his wages, of about 2s. or 2s. 6d. per day, insufficient for the maintenance of his family, he commenced being toll-keeper, but did not succeed in his new profession. He had, therefore, brought his wife and children to New York, being possessed only of a small sum of money, and of some furniture, a fowling-piece, &c. He had made application immediately on his arrival at New York, some weeks previously, for employment, but no one would receive him into his ship-building yard, in which there is much valuable property, without attestations of his character. He accidentally heard of my being in the neighbourhood, and applied to me to give him such attestations. Knowing previously nothing of this young man but what I have mentioned, it was impossible for me to comply with his request, but I gave him a letter to a gentleman in the neighbourhood of New York, who might, I thought, be of use to him, stating exactly what I knew of him. Workmen in the ship-building line were at this period plentiful, and months followed before any opening occurred for employing Boswell. In the meantime, his finances were exhausted, and he had been obliged to part with some of the property he had brought with him. He was beginning to wish himself well home again, when an offer of work was made to him. I happened to be in New York on the very day when this occurred, and remember well the pleasure which beamed in his eyes when he told me of the offer, and asked me what wages he should propose. My advice to him was to leave that matter to his master, after he had been at work for a week, and showed what he could do. The next time I saw Boswell, he was in the receipt of two dollars (about 9s. sterling) a-day, for ten hours' work, and of as much more at the same rate per hour, if he chose to be longer employed. His gains—for he told me that he could live at one-half of the expense which it cost him in Scotland, although his family here had animal food three times a-day—soon enabled him to have a comfortable well-furnished house, where I again and again saw his family quite happy, and in which he had boarders. I sent for him to Hoboken, where I was then living, two or three days before I left New York, in the month of April 1831, that I might learn if I could be the bearer of any communication to his friends in Scotland. He came over to me with a better suit of clothes on his back, and a better umbrella, than, I believe, I myself possessed. He only wished, he said, his friends to know how well settled he now was. He had earned, on the preceding day, almost as much as he could earn at the same business in Scotland in a week; and he hoped in less than twenty years, to make a fortune, and return to Scotland. I have mentioned the whole of the particulars of this case (continues Stuart), because it contains information useful to many. Certificates of good character are very requisite for all emigrants to the United States, but especially for mechanics and labourers; and they should either be procured from magistrates or from clergymen, no matter to what sect they belong. I need not add, that it is most important to obtain recommendations, where they can be got, to some respectable individual at the port where the emigrants first of all arrive." This judicious advice of Mr Stuart is worthy of the utmost attention from emigrants to America, especially when we reflect upon the number of disorderly characters, fraudulent bankrupts, and other fugitives from Great Britain, who flee thither to escape the arm of the law, and with the view of burying their ignominy in the widely-scattered clusters of population of this vast trans-Atlantic republic.

PLANTS AND FLOWERS:

THEIR SCENT, USES, AND MEDICINAL PROPERTIES.

The odour of flowers is known to affect different people in a variety of different ways, a single plant producing a fainting sensation in one individual, that would be valued by another as possessing a refreshing and reviving influence. The scent of certain flowers, that produce headaches in some, will be totally innoxious to others; and one man may be charmed with the smell of a flower, which another would deem offensive. Flowers also may be placed in quantities in a room without injury to the waking inmates, but they are generally supposed highly insalubrious to those who may inhale their odours while asleep. Flowers, with some few exceptions (the rose and violet, for example), exhale their perfume only while the plant is living; that which proceeds from the bark and other parts of the plant continues to be emitted after death. Some flowers emit their odours only at certain periods. Those having an ambrosial smell, exhale only after sunset, and the appearance of some plants corresponds with the nature of their scent. Musky-scented flowers, for instance, are always of a yellowish and purple colour, and a dull appearance is indicative, it is said, of the deleterious nature of their perfume.

Again, the scent of some plants is not perceptible until after they are cut down, and exposed to the influence of either the sun or artificial heat. Grass, while growing, possesses no particular smell, but, when made into hay, it scents the country around; this may probably proceed from no particular plant, but a commixture of the various herbage of the crops. The wood of the ash-tree, when burned in a green state, will emit a fragrance like that which proceeds from the violet and mezerion, and this it will diffuse to a very considerable distance. The glands of the fraxinella, from which it exhales its scent, are large enough to be seen by the naked eye, and the vapour is so combustible, that it will burn when a light is placed within its influence. The garden nightshade has the property of causing sleep to overpower those who may inhale its odour; and all have heard of the upas-tree, which (though we may not give credit to the exaggerated accounts of its deadly power) possesses, without doubt, an uncommonly deleterious quality of vapour. The odour of plants and flowers, which seems thus to inherit the property of creating such a diversity of feelings in the human frame, is considered by naturalists to be an excretory secretion, forming a gas or vapour, which in some is supposed to proceed from the petals transmitted from the plant by the claws at its base, and, escaping through orifices on their surface, at others from the nectaries, or various parts which compose their blossoms. Although the effect produced by this gas or vapour is sufficiently visible, yet, as far as regards a knowledge of its nature, we remain totally uninformed. All we can conjecture is, that it must be a body composed of solid particles, each body possessing a power of affecting the senses of animals, in a manner peculiar to itself. The object which nature had in view in bestowing this property on flowers and plants, is also hidden from our ken; but it is not improbable that it may be for the purpose of informing the multifarious tribes of the earth where the supply of necessaries fitted for their sustenance may be found. Different plants have various and opposite qualities: some possessing the most nutritious ingredients, others containing the most deadly poisons; and while some have the power of tainting the air to a certain extent with their deleterious odours, all have a tendency to purify it of certain particles which are injurious to animal existence. Animals, by the use of vegetables for food, consume a large quantity of carbon, or charcoal, a part of which is only necessary for the well-being of the individual; and the superfluous part is therefore exhaled by the breath, which consequently contaminates the surrounding atmosphere. A man, it is calculated, exhales in breathing no less than 11 oz. of charcoal every day. The vegetable world, on the contrary, far from being injured by an over quantity of carbon, is ever requiring an augmentation of its stores; and plants therefore absorb from the air, when it comes in contact with the sap at the apertures or stomas situated on the surface of their leaves, that part which would otherwise be so detrimental to animal life. Mr Sennebier covered a plant, which was growing in a pot of earth, with a glass bell full of water, and in the course of a few hours found a quantity of air in the bell. He repeated the experiment with water which had been boiled, in order to deprive it of its air; and in this instance no air was produced in the bell. At length Mr Sennebier, in the prosecution of his experiments, discovered the cause of this phenomenon.

Water in its natural state contains a quantity of carbonic acid, which is a composition of oxygen and carbon. The plant had therefore absorbed the carbonic acid; and, with the action of the sun's rays on

its leaves, had decomposed the acid, had retained the carbon, but had exhaled the oxygen by the stomas.

The quantity of carbon thus acquired by plants has been ascertained by the following ingenious experiment, made by M. de Saussure. He transplanted fourteen periwinkles into vases: he watered seven of them with distilled water, and the other seven with water in its natural state. After some days, he found that the former had acquired no additional carbon; but the latter had accumulated so much, that their wood was one-sixth heavier than the former.

Carbon being the principal ingredient of plants, their growth, and consequent welfare, depend on a constant supply of it; and in order to render it fit for assimilation, or, in other words, to prepare it for forming a nutritive substance for the food of the plant, it is necessary that it should previously be combined with oxygen. This chemical process can only be performed by the aid of the solar light; plants therefore, during the night, inhale oxygen in order to combine it with the carbon which is contained in the animal and vegetable matter, which the sap also holds in solution; and on the return of day, the carbonic acid thus formed is decomposed by the solar influence, and the oxygen restored to the atmosphere, together with that portion which has been absorbed from the soil by the roots. This is what renders flowers placed in a sleeping room injurious to the inmate, by the great absorption of the air.

Various plants possess in themselves a property of nutriment, and at the same time a poison. In such cases, however, the poisonous portion is never found in the food of the plant. In the pulp of the peach, for example, there is no sign of the prussic acid which scents its flowers and taints its kernel; and if the embryo of the yewberry was removed, its pulp, it is supposed, would be harmless. Amongst roots such is also the case. Potatoes, it is known, contain a poison which it secretes in its skin, or immediately beneath it; and the rind of the common turnip, which, though probably not poisonous, is acrid and pungent in a greater degree than the bulb itself.

The poisonous juice of the nettle, which is known to raise in blisters the skin of whoever may touch it, is contained in the hair which is observed on its leaves, while the other parts of the plant are altogether harmless. All stinging plants effuse this juice, by means of very minute glands, situated either at the points of these hairs or at their base, which hairs may be compared to those that grow on the orifices of the pores of the human skin. When the gland is situated on the point of the hair, the liquid which it contains is of an innocent nature; but when situated at its base, it is acrid, caustic, and poisonous. The sting is inflicted by the hair, which, piercing the skin, pours the poison into the wound, and causes the effects already described.

Nettles when softened by moisture are quite harmless, because the hair by that means losing its elasticity, cannot make the incision necessary for the introduction of the poison, and therefore no sting is felt. Stinging plants may also be handled with impunity after death, if dried; for although in this case the instrument may be capable of stinging, yet the juice is no longer fluid, and therefore cannot flow into the wound.

The cassava of central America, of which the Indians make their cassava bread, not only belongs to a very poisonous class of plants, but is, when raw, a deadly poison. The perennial mercury, or "dog's cabbage," so called from dogs preferring it to other plants when they want to physic themselves with vegetable substances, may be eaten when well boiled, though it will still retain an aperient quality; but when raw, or even when roasted or fried, it is a powerful poison. The fruit of the fig and mulberry is eatable, but the juice of both is poisonous, particularly that of the fig. The juice of the poppy, which maintains so high a rank in the estimation of medical practitioners, produces a most potent poison; yet the sanitory purposes to which it is applied by a different mode of preparation, are too well known to be here described. This juice is obtained from the unripe seed of the white poppy, and in Asia Minor whole fields are sown with the seeds of this plant. When the heads are nearly ripe, they are wounded on one side with a pointed instrument, and a white liquor is distilled from the wound, which the heat of the sun hardens on the plant. This is gathered next day, when fresh wounds are made on the opposite side of the seed-vessel; but what comes from the first incision is greatly superior to that which flows from the second. This is opium, which, after being gathered in the manner described, is moistened with a small quantity of water, or honey, until it becomes of the consistency of pitch, when it is formed into cakes or rolls for sale. Tincture of opium, which is made by distilling it in spirits of wine, is called laudanum. The foxglove, which is so common in Scotland and England, is very useful for medicinal purposes, yet is very poisonous. The honey-flower, a Cape plant, produces more honey than any other plant; so much so, that a tea-spoonful may be collected every morning from each of its numerous flowers; but the strong and disagreeable smell of the plant indicates a poisonous quality. There is another plant, the "crown imperial," which produces nearly as much honey, but the plant is so poisonous that the bees will not use it.

The general usefulness of plants is so well known, that it would be altogether superfluous to enter into any very lengthy observations on the subject; yet the mention of a few of those which do not often come under general observation, may not be found uninteresting. The clothier's teazle, now so much cultivated in the west of England, affords a solitary instance of a natural production being applied to mechanical purposes, in the state in which it is produced. Many attempts have been made to supersede the teazle, by contrivances designed for the same use, but all in vain; every fresh invention has been abandoned as defective or injurious, and the teazle, it is allowed by all, can only do the work. The heads of the teazle are composed of incorporated flowers, each separated by a long, rigid, chaffy substance, the terminating point of which is furnished with a fine hook: this is fastened round the edge of a large broad wheel, which is kept turning, while the cloth is held against these heads, by which means the ends of the wool are drawn out from the manufactured cloth, so as to bring a regular nap on the surface, free from knottings and twistings, the loose parts combed off, and the piece is finished when the cloth ceases to yield any resistance to the free passage of the wheel. The dressing of a piece of cloth requires from fifteen hundred to two thousand of these heads to accomplish the work properly.

An infusion of sage leaves is sometimes used as tea: and the Chinese are surprised that Europeans should come to them for tea, when they have plenty of sage, which the Chinese think far superior. The Dutch have long been in the habit of collecting, not only in Holland, but in the south of France, large quantities of sage leaves, which they dry like tea, and pack in cases for exportation to China, where, for every pound of sage, they receive four pounds of tea. Rubia tinctorum, or "dyer's madder," common in the west of England, affords a very beautiful scarlet dye, which is extracted from the root, and which imparts a corresponding colour to the milk, and even to the bones of the animals which feed upon it.

From the opening and shutting of several flowers, as well as leaves, we may judge of the state of the atmosphere. If the Siberian sow-thistle shuts at night, the following day may be expected to be fine; if it remains open, it is indicative of rain. If the African marygold continues shut in the morning long after its usual time for opening, rain is approaching. The convolvulus, bind-weed, and scarlet pimpernel, even after they have opened, will shut themselves up again, on the approach of rain. From this circumstance, the pimpernel has obtained the name of the "poor man's weather-glass." In former times, when it was believed that the cure of almost every disease might be effected by the application of preparations from herbs and flowers, the plants were quaintly denominated after the disease they were supposed capable of curing; such as, all-heal, break-stone, bruise-wort, gout-weed, fever-weed, &c. &c. Our forefathers had also plants which were thought equally serviceable in healing mental disorders, and were accordingly called heart's-ease, loose-strife, true-love, &c. &c. and they carried their observance of plants so far as to suppose that the flower of the large white lily indicated the price of wheat by the bushel, for the ensuing year, every blossom being equivalent to a shilling.

TRAVELLING ON THE GANGES.

[In the publication entitled the Asiatic Journal, among much matter of inferior interest to Europeans there is usually to be found a variety of instructive and entertaining articles, descriptive of East Indian manners, customs, and scenery, which are calculated to afford pleasure in the perusal. One of these, which has just met our eye, is an account of the mode of travelling on the river Ganges—a process, we presume, little known to our readers, and with which we now take the liberty of making them acquainted.]

THERE is scarcely any season of the year in which Anglo-Indians do not avail themselves of the grand water-privilege, as our American friends would term it, offered by the Ganges; but at the dangerous period—that of the rains—when the river is full, and its mighty current comes rushing down with the most fearful velocity, its voyagers are multiplied, partly in consequence of the difficulty of traversing the country by land, and partly on account of the hope that may be entertained of a quick passage; the navigation being more speedy than when the river is low, and its waters comparatively sluggish. In proceeding up the Ganges, at the commencement of the rains, the general steadiness of the wind, usually blowing from a favourable point, enables the ascending vessels to stem the current by means of their sails; but should the breeze fail, which is frequently the case, or prove adverse—a not unlikely contingency—the boatmen are compelled to undergo the tedious process of tracking, in some instances not being able to drag the vessel beyond a couple of miles in the course of a long and fatiguing day's work. The progress down the river is much more rapid, the swiftness of the descent being sometimes perfectly frightful: boats are absolutely whirled along, and if, while forced at an almost inconceivable rate by the impetuosity of the current, they should strike against the keel of a former wreck, or come in contact with some of the numerous trees and other huge fragments, victims of the devouring wave, destruction is inevitable. The boat sinks at once, and the crew and passengers have little chance of escaping with their lives, unless at the moment of the concussion they jump into the river, and are able to swim to shore. The crazy, ill-appointed state of the greater portion of the vessels which navigate the Ganges, renders it surprising that so little loss of life should be sustained from the vast multitudes who entrust themselves to such fragile conveyances upon a river which, when swelled by mountain floods, and vexed by ruffling gales, comes raging and roaring like a sea. It is seldom that small boats are attached to the larger craft, to put out in case of danger, and many persons may drown in the sight of a large fleet, without the possibility of being picked up.

Notwithstanding these and other drawbacks nearly as formidable, families proceeding to and from the upper provinces, generally prefer the river to any other mode of travelling, since, during the rains, though not the safest, it is by far the most practicable. Fresh arrivals, from Europe especially, find it easier to visit the places of their destination in the interior by water than by land; the necessary preparations are less extensive, and the fatigue and trouble of the journey greatly diminished. The safest and the most commodious kind of vessel, with respect to its interior arrangements, is a pinnace, but it is not so well calculated to pass the shallows and sandbanks of an ever-shifting stream, as the more clumsy and less secure *budgerow*. This boat, whose name is a native corruption of the word *barge*, is, therefore, usually chosen by European travellers, to whom time and expense are objects of importance. Though, to a certain extent, the term *clumsy* may fairly be applied to a budgerow, its construction and appearance are far from inelegant; with a little more painting and gilding, a few silken sails and streamers, and divested of the four-footed outside passengers and other incumbrances on the roof, it would make a very beautiful object in a picture, and in its present state it has the advantage of being exceedingly picturesque. The greater part of the lower deck is occupied by a range of apartments fitted up for the accommodation of the party engaging the boat; these are generally divided into a sleeping and a sitting room, with an enclosed verandah in front, which serves to keep off the sun, and to stow away various articles of domestic furniture. The apartments are surrounded on all sides with venetians, which exclude the sun in the day-time, and let in the air at night; and by those who are aware of the different kinds of annoyances to be guarded against in river-travelling, they may be rendered extremely comfortable. The addition of *chicks*, blinds made of bamboo split very fine, to be unrolled when the *ghil mills*, as the venetians are called, are opened, would prevent the invasions of those numerous armies of insects which after sunset infest the cabins; and those who do not consider rats desirable guests, will do well to provide themselves with a staunch terrier dog, or a couple of good cats, otherwise they may expect to be overrun with vermin, to the great increase of dirt and bad smells, and to the destruction of clothes and the supplies for the table. In front of the cabins, the deck is of circumscribed dimensions, affording only space for the boatmen, who, on descending the river, facilitate the progress of the vessel by means of long sweeps; the upper deck, therefore, or roof, is the chief resort of the crew and the servants. At the stern the helmsman stands, perched aloft, guiding a huge rudder; the *goleer*, stationed at the prow, ascertains the depth of the water by means of a long oar; and when the wind will permit, two large square sails are hoisted, with the assistance of which the lumbering vessel goes rapidly through the water. In addition to the furniture for the cabins, sea (or rather river) stock must be procured, consisting of groceries of all kinds, wine, beer, and brandy, salt provisions, tongues, hams, tamarind-fish,* flour, biscuits, and charcoal; a dozen or two of live fowls and ducks, and a couple of milch goats. As the budgerow is not calculated for a heavy or cumbrous freight, a baggage-boat is necessary for the conveyance of the goods and chattels of the party, and for the accommodation of those servants who cannot be conveniently retained on board the superior vessel. These boats are usually of the most dangerous description, and the number of accidents continually occurring to them, the destruction of property which, even if fished up from the depths of the Ganges, is totally spoiled, and the constant anxiety and alarm they occasion, would in almost any other country deter persons from hiring such ricketty conveyances; but it is the custom to imperil the most valuable effects in this manner, and they are abandoned to the tender mercies of the winds and waves.

A *dinghee*, or wherry, is a very essential adjunct to river-navigation, but it is not always to be procured; and when one of these light skiffs cannot be attached to the larger craft, the communication between the cook-boat and the budgerow is frequently cut off. The former vessels are usually very heavy sailers (how they manage to get on at all, with their canvass in as ragged a condition as the pocket-handkerchief of Sylvester Daggerwood, is the wonder), and they are consequently often left at a long distance behind at the arrival of the hour of dinner. The unhappy passengers in the budgerow, after waiting in vain for the smoking supplies they had anxiously expected, are compelled to be satisfied with a less substantial meal of coffee, eggs, dried fish, or any thing else that their lockers may afford. Few persons venture to move after sunset, both on account of the dangers of the

* Fish cured with the acid juice of the tamarind.

navigation from the numerous shoals and other obstructions, and the increased expense, as it would be necessary to engage a double set of boatmen, the ordinary number being insufficient for the performance of extra duties. At daybreak in the morning, the vessel is usually pushed out into the stream, spreading her sails like those of "a wild swan in its flight," or proceeding more leisurely by the united exertions of sixteen men dragging at a rope fastened at the mast-head; breakfast is laid in the outer room, and is well supplied with luxurious fare.

After the breakfast has been cleared away, those persons who entertain any regard for their eyes or their complexions, will fasten the venetians, and, darkening the boat as much as possible, employ themselves in reading, writing, or working. But strangers find it difficult to abstain from the contemplation of the novel and wondrous scenes around them. The broad and sparkling river is covered with objects of interest and attraction. In some parts of the Ganges, every wave appears to bring with it clusters and coronets of the largest and most beautiful flowers: so numerous are the garlands which the worshippers of the deity of the stream throw into its glittering waters. The rich and luxuriant clusters of the lotus float down in quick succession upon the silvery current. Nor is it the sacred lotus alone which embellishes the wavelets of the Ganges; large white, yellow, and scarlet flowers pay an equal tribute; and the prows of the numerous native vessels navigating the stream are garlanded by long wreaths of the most brilliant daughters of the parterre. India may be called a paradise of flowers; the most beautiful lilies grow spontaneously on the sandy shores of the rivers, and from every projecting cliff some blossoming shrub dips its flowerets in the wave below.

In tracking, the budgerow is frequently not more than a yard or two from the water's edge, and nothing can be more gratifying to the eye than the moving panorama which the scenery of the Ganges exhibits. One of the most striking and magnificent features of an Indian river is the ghaut. The smallest villages on the banks of the Ganges possess landing-places, which we vainly seek in the richest and most populous parts of Europe. The Anglo-Indian, landing upon the English coast, is struck with the meanness of the dirty wooden staircases which meet his eye at Falmouth, Plymouth, and other places of equal note and importance. In India, wherever a town occurs in the vicinity of a river, a superb and spacious ghaut is constructed for the accommodation of the inhabitants: the material is sometimes granite, but more frequently well-tempered and highly-polished chunams. From an ample terrace, at the summit of the bank, broad steps descend into the river, inclosed on either side with handsome balustrades. These are not unfrequently flanked with beautiful temples, mosques, or pagodas, according to the creed of the founders; or the ghaut is approached through a cloistered quadrangle, having the religious edifice in the centre. The banian and the peepul fling their sacred branches over the richly-carved minarets and pointed domes, and those in the brahminee villages are crowded with troops of monkies, whose grotesque and diverting antics contrast strangely with the devotional attitudes of the holy multitude performing their orisons in the stream. Nothing can be more animated than an Indian ghaut; at scarcely any period of the day is it destitute of groups of bathers, while graceful female forms are continually passing and repassing, loaded with water-pitchers, which are balanced with the nicest precision on their heads. The ghaut, with its cheerful assemblage, disappears, and is succeeded by some lofty overhanging cliff wooded to the top, and crowned with one of those beautiful specimens of oriental architecture scattered with rich profusion over the whole country. Green vistas next are seen, giving glimpses of rustic villages in the distance, and winding alleys of so quiet a character, that the passer-by may fancy that these sequestered lanes lead to the cottage-homes of England—a brief illusion speedily dissipated by the appearance of some immense herds of buffaloes, either wallowing in the mud, with their horns and the tips of their noses alone out of the water, or proceeding leisurely to the river's edge, which, when gained, is quitted for the stream.

The snorting multitude are left behind, and the scene changes again: deep forests are passed, whose unfathomable recesses lie concealed in eternal shade; savage jungles and marshy wastes; then cultivation returns; wide pastures are spread along the shore covered with innumerable herds; the gigantic elephant is seen under a tree, fanning off the flies with a branch of palm, or pacing along, bearing his master in a howdah, through the indigo plantations. European dwellings arise in the midst of park-like scenery, and presently the wild barbaric pomp of a native city bursts upon the astonished eye. Though the general character of the country is flat, the undulations occurring on the banks of the Ganges are quite sufficient to redeem the scenery from the charge of sameness or monotony. High and abrupt promontories diversify the plain; when the river is full, the boat frequently glides beneath beetling cliffs, crowned with the crumbling remnants of some half-ruined village, whose toppling houses are momentarily threatened with destruction, or covered with the eyries of innumerable birds, and tapestried with wild creepers, which fling their magnificent garlands down to the sands below. Other steeps are clothed with umbrageous foliage, and between the trees glimpses are caught of superb flights of stairs, the approach from the water of some beautiful pagoda peeping out upon the summit, the habitation and the temple of a brahmin, who occupies himself solely in prayer, and in weaving garlands, part of which he devotes to the altars which he serves, and part to the bright and flowing river. These exquisite buildings occur in the most lonely situations, apparently far from the dwellings of man, and the innumerable varieties of birds, some flying in large flocks, and others stalking solitary along the reedy shore, will at all times compensate for the absence of objects of greater importance.

The reputation for splendour of the Anglo-Indian style of living, appears to be fully borne out by the grandeur of the display made upon the banks of the Hooghly. The European towns which grace the shore are superb; palace succeeds to palace as the boat passes Ishara, Barrackpore, and its opposite neighbour Serampore, whose broad and beautiful esplanade presents one of the finest architectural landscapes imaginable; luxuriant gardens intervene between magnificent houses; some shaded with forest trees, others spreading their terraced fronts and pillared verandahs in the full glow of an eastern sun. The French settlement of Chandernagore, a little higher up, only inferior to its Danish neighbour, offers a less striking and imposing front, and though boasting houses of equal splendour, does not appear to so much advantage from the river, while Chinsurah, at a short distance, is infinitely more picturesque. Smaller habitations attract the eye, perched upon the summits of crags richly wreathed with multitudes of creeping plants, and through numerous openings between these lovely cliffs, blooming labyrinths appear, which have all the charms the imagination imparts to beauties only half-revealed.

Towards the middle of the day, the boat becomes insufferably hot; both sides have received the fierce glare of a burning sun; the heat is reflected from the water, which is now too dazzling for the eye to endure without pain; the morning breeze dies away, and it requires all the patience of a martyr to sustain the torments inflicted by the scorching atmosphere, especially as the roofs of the cabins are usually too low to allow a punkah to be hung. As the sun declines, the boat gradually cools down to a more agreeable temperature; and when the welcome shadows of the woods descend upon the deck, it is delightful to sit in the open air and watch the progress of the vessel, as it nears the shore, to the spot appointed as its station for the night. The moment that the budgerow is securely moored, a very active and animated scene commences: the domestics, whose services are not required on board, and all the crew, immediately disembark; fires are kindled for the various messes; those who are anxious for quiet and seclusion light up their fagots at a considerable distance from the boat. The rich background of dark trees, the blazing fires, the picturesque groups assembled round them, and the tranquil river below, its crystal surface crimson with the red glow of an Indian sunset, or the fleeting tint fading away, and leaving only the bright broad river—molten silver, or polished steel, as the dark shadows of the night advance, form an evening landscape always pleasing, and varying with the varying scenery of the ever-changing bank. While the cloth is laying in the cabin for dinner, the Europeans of the party usually walk along the sands of the river, or penetrate a short distance into the interior, sometimes passing through fields of indigo, or plantations of cotton, whose bursting pods strew the pathways; at others pausing to admire the feathery appearance of a beautiful species of grain, which resembles the snowy plumes of the ostrich, and, rising to the height of several feet, produces a magnificent effect as it is undulated by the passing breeze. The cultivated places are watched by vigilant guardians, whose duty it is to protect them from the incursions and depredations of men and beasts. At night, these persons frequently nestle like birds in the branches of the trees, some of the more luxurious having their charpoys (bedsteads) fastened on convenient boughs; in the day-time, they are perched up in a small wooden watch-tower, which, as they always sit, or rather squat, looks like the upper half of a sentry-box, raised upon a scaffold of bamboo.

It is curious to observe how very little accommodation is necessary to secure the comfort of a native in these happy climes; while Europeans are expiring with heat, the enjoyment of the Indian is unalloyed; he lives in the open air, cooks his simple meal of pulse and vegetables under a tree, and sleeps in a hut of straw scarcely large enough to contain his body. The pedestrian frequently comes upon one of these wigwams, for they are nothing more, and they seem to be favourite abodes, since gardeners in European families, who might be much better lodged, are fond of making a lair for themselves in some sequestered spot in the scene of their daily labours. A few branches are wattled together over-head, a screen of reeds placed in the direction of the wind, the earth is swept scrupulously clean, and the bed, a simple framework of bamboo laced together in a very ingenious manner with cord, does not look uninviting. If the heat of the day could be borne with impunity, this kind of sylvan life, realising the romantic notions of early youth the forest wanderings so often indulged in fancy, would be very delightful, especially where rich and nutritious fruits, some produced without cultivation and others by the lightest labour, hang temptingly within reach.

Night, always beautiful in India, assumes a still more lovely aspect when it spreads its soft veil over the voyagers on a river; the stars, which come shining forth along the deep blue sky, inlay the waters beneath with glittering ingots; the flowers give out their most delicious odours, and rock and tree, hut and temple, are invested with a double charm. Sleep does not often deign to light upon the lids of those who voyage up the river in a budgerow. The scrambling of rats up the venetians, which they use as ladders, and their races over the bed, if not provided with musquito-curtains, effectually disturb the slumbers, and the stings of insects, which even the musquito-curtains fail to keep out, render the couch any thing but a place of rest.

THE PRIOR OF ST MICHEL.

THE *Landscape Annual* for 1834, which is altogether devoted to descriptions of French scenery, contains a most wickedly amusing story; nevertheless, one calculated to make us look back with horror on the barbarism of the period in which it was transacted. The story turns upon the fate of a certain Prior of St Michel, who lived in the time of Louis the Eleventh, a monarch whose unscrupulous habits in reference to such as were displeasing to him, are so strikingly depicted in Quentin Durward. The worthy churchman had gone on a pilgrimage to the Holy Land, where he loitered so long that he was given up for lost, and a new prior appointed in his stead. At length he returned, to the great annoyance of his successor, and also of the king, whose promise of something better at a future time was, with him, quite unavailing. The Prior of St Michel he had set out, prior he had returned, prior he was, and he would live and die the Prior of St Michel.

Agreeably to this fixed determination, the old prior lost no occasion of appearing in the presence of King Louis—at all hours, and at all seasons; in the levée and out of the levée, there stood the worthy old man, often in respectful terms beseeching that his former priory might be restored to him. It was in vain: the king's supremacy was not to be called in question. But when he no longer dared to press his suit, he stood there as before; and his looks and very silence were a more eloquent appeal than words could make it. It annoyed Louis; he at last grew angry, and the scowl that hung upon his brow announced that the rash petitioner's days were numbered. That morning, on quitting the levée, the king called to him, Master Tristan, his faithful and dreaded secret executioner—"Friend Tristan!" quoth the king, "canst thou not dispose, without delay, of this prior of St Michel, so that I be no longer troubled with him?" Even a hint to Tristan, as it usually was, would have been sufficient; but this broad and marked denunciation was equivalent to at least a score of ordinary death-warrants; for seldom had he seen the black spot, which portended a rising storm, more distinctly dark upon his master's brow. It was fate, the will of Heaven, and the certainty of unalterable doom to the eye of Tristan; and the quicker, perhaps, he executed it, the better for himself. At least so reasoned Tristan; and accordingly, that same evening, he paid a visit to the prior, whom, to his surprise, he found, little dreaming of his approaching fate, engaged in spending a festive hour in the society of a few of his most particular friends. Being well known as a favourite at court, Tristan was received with the utmost politeness, and requested by the host to take a seat, and pledge him to the health of their excellent sovereign. Tristan could not but assent; and having sat and chatted a little while, he requested a minute's conversation with the good prior in another apartment. The moment they were alone, Tristan opened his commission, presenting the royal order and a large sack, into which he invited the prior to step without delay, in order that he might have the honour of speedily throwing him into the Seine. He was not even allowed time to send an apology for his involuntary absence to his guests; for, bagging the prior, Tristan took the shortest path to the river. The ensuing morning, as the king was employed in taking the air in his palace gardens, with the faithful Tristan at his side, consulting upon matters appertaining to the welfare for his realm, and chatting over the affair of the prior—whom, thanks to friend Tristan, he hoped never more to behold—what was the king's horror, on turning an alley, to meet the identical old prior himself! "Ah, traitor!" cried the king, turning to Tristan, "didst thou not assure me thou hadst rid me of this eternal plague, and here he confronts me again?" "Sire!" answered the alarmed favourite, "you charged me to rid you of the prior of St Michel, and I drowned him only yesterday evening in the river; this is the EX-prior. But if there be any mistake, I will put it right; there are plenty of priors, and this night you shall complain no more of the old one here." "Is it so indeed?" cried the king, laughing, for he had much legitimate merriment in his disposition, "then all is right. One prior is enough at a time, and let him live now as long as it may please Heaven. Go, old man," he added, "you will now find your priory vacant; but to have two priors at once, there is no bearing that."

Column for the Boys.

My Dear Little Boys—In the last column which I wrote for your entertainment, I gave you an outline of the most remarkable characteristics in those funny little insects, the ants; and I now intend to tell you some things equally curious and instructive about spiders. I know you have often destroyed the webs of spiders when they came in the way of your amusement, and that you consider spiders nasty little animals, of no use whatever, but only a trouble to people, and, therefore, liable to be crushed under foot when they make their appearance. Still, I can tell you, spiders are a very singular kind of animals; they are a curious people; and in them we find manifested the strongest instances of wisdom in the Creator. Although we may lightly be inclined to suppose that they are useless, and that the world, at least our houses, would be better without them, on serious reflection we would be disposed to think otherwise. Spiders are by no means useless animals. They are of a ravenous disposition, and mostly live on other little creatutes; but in doing so they are of service, in preventing the undue multiplication of various troublesome insects, and are, therefore, like some kinds of ants, really the friends of human beings.

As you all know what spiders are like, I need not here go into a scientific account of their formation: that would only tire you. They have a little ball-like body, supported on eight long slender legs, by which they can run with amazing rapidity; they have no division between the head and shoulders, as is commonly the case with insects; they breathe by means of gills, situated under their belly; and on the front and top of their head, they have, for the most part, eight eyes. The arrangement of these eyes is one of the most striking features in the animal, and is employed by naturalists to distinguish the various species. These eight eyes are, in the different species, placed in all sorts of ways; sometimes in two semicircular rows; sometimes almost in a circle, with others in the middle; sometimes in two lines, diverging from a point; and generally, in their appearance, putting us in remembrance of the rows of buttons on the breast of a soldier's jacket. It has never been exactly told why spiders should have eight eyes, or why their eyes are arranged in the way I have here mentioned; and it is quite enough for us to comprehend, in general terms, that the vision of spiders is so ordained, simply because it best suits their natures and pursuits. They have need to look out at little holes in their nests, to watch not only their prey, but, at the same time, the different corners of their webs; and in walking along the roofs of apartments, they must necessarily have the power of looking downwards from the crown of their heads, if such an expression can be properly used. We may be at least certain, that Nature has not given them more eyes than they require, or placed them otherwise than is most agreeable to their habits. In short, as I have said, spiders are a curious people—a people at war with other races of insects, and so a people who require to have all their eyes about them.

Spiders have no wings; but as by their nature they require to proceed through the air from place to place, this want has been most wonderfully compensated by the power which has been bestowed upon them of shooting forth fine lines from their bodies, on which they can walk across from point to point, as on a bridge. Now, the process by which even the smallest spider forms this line or bridge is one of the most remarkable in the whole system of animated nature—certainly more so than the spinning of silk by caterpillars, which is less complicated, as the same end is not required. To enable spiders to spin these lines, they possess the property of secreting a fine glutinous liquid substance in their bodies, which rests ready for use in certain bags or reservoirs, and from these receptacles the liquid proceeds to be emitted by five different teats. It is found again that these teats or spinnerets are studded with regular rows of minute bristle-like points, about a thousand to each teat, making in all from five to six thousand. These points are minute tubes, called by naturalists spinnerules, each being connected with the internal reservoir, and emitting a thread of inconceivable fineness. When in the process of forming lines, therefore, the spider forces out five thousand fine threads, which being immediately brought together into one, much in the manner of rope-spinners, they thus form a single line fit for any purpose they require. Now, is not this a most extraordinary process to be carried on by such an insignificant little creature as a spider? It is certainly marvellous. Perhaps you may be inclined to doubt that each of the threads of a spider's web is composed of so many as five thousand threads twisted into one; but I can assure you, that naturalists, by the aid of magnifying glasses, have discovered such to be the case beyond all possibility of doubt; and I will show you why there should be such a complex process. You must know that two objects are required to be gained by the spider in spinning its threads. The threads must be made strong enough to bear the burden of the spider's body, and to do so immediately they must dry and be ready for use as soon as they are emitted. By at first coming out in such fine lines, they are individually exposed to the air before meeting, and thus the thread formed by the junction is instantaneously of that firm consistence which is so essentially requisite. If the spider spun at first only one stout line instead of so many small ones, it would be long in drying, and would never be strong enough either to form its bridge or its web.

It seems that naturalists have had many differences of opinion on the way in which the spider is enabled to send forth its lines or threads from point to point. Many scientific men, misled by appearances, have supposed that the animal possesses a power of shooting or darting out its threads with such a velocity and so sure an aim, as to cause them to proceed towards and adhere to the object desired. This account of the shooting of the lines is proved to be absurd. The spider has no such power. It attaches its lines to distant objects entirely by the aid of the atmosphere or wind, which floats away the thread to the required point. Without a little stream of air, it cannot shoot a line; but, on the other hand, so very slight a breath of air will answer its purpose, that it is rarely at a loss for the means of conveyance for its threads. That this is the most correct account of the shooting of lines by spiders, is sufficiently proved by the following experiment, tried by the intelligent editor of the article "Insect Architecture," in the Library of Entertaining Knowledge:—"So far as we have determined, all the various species of spiders, how different soever their webs may be, proceed in the circumstance of shooting their lines precisely alike; but those which we have found the most manageable in experimenting, are the small gossamer spider, known by its shining blackish-brown body and reddish-brown semi-transparent legs; but particularly the long-bodied spider, which varies in colour from green to brownish or grey—but has always a black line along the belly, with a silver white or yellowish one on each side. The latter is chiefly recommended by being a very industrious and persevering spinner, while its movements are easily seen from the long cylindrical form of its body and the length of its legs. We placed these two species, with five or six others, in empty wine-glasses set in tea-saucers, filled with water to prevent their escape. When they discovered, by repeated descents from the brims of the glasses, that they were thus surrounded by a wet ditch, they all set themselves to the task of throwing their silken bridges across. For this purpose, they first endeavoured to ascertain in what direction the wind blew, or which way any current of air set, by elevating their arms as we have seen sailors do in a dead calm. But as it may prove more interesting to keep to an individual, we shall watch the proceedings of the gossamer spider. Finding no current of air on any quarter of the brim of the glass, it seemed to give up all hopes of constructing its bridge of escape, and placed itself in the attitude of repose; but no sooner did we produce a stream of air, by blowing gently towards its position, than, fixing a thread to the glass, and laying hold of it with one of its feet by way of security, it placed its body in a vertical position, with its spinnerets extended outwards; and immediately we had the pleasure of seeing a thread streaming out from them several feet in length, in which the little aëronaut sprung up into the air."

It is by the process I have now noticed that spiders send forth their threads from hedgerows, and other elevated places, across roads, and towards any object they are desirous of reaching; and it is by the exercise of the same faculty that they construct their webs or nests in the corners of apartments, or other fit places of residence. These webs are generally made in a circular form, with threads diverging from a central point; and the meshes are regulated in a very neat manner, by the spider measuring with its legs, as it goes round, the exact distances betwixt the threads. The limbs of the spider are well adapted for holding by the threads, or for clearing away any matter from the surface of the web, or from its own body. Each foot has three claws, one of which acts as a thumb; the others are toothed in the inside like a comb; and with these the animal combs its legs, or smooths its threads from particles of dust.

One of the chief points of character in spiders, is their living in solitude. Many other insects, as ants and bees, can exist only in communities; but the spider spends its days in its own separate cell, and depends entirely on itself for the means of subsistence. Of all the solitary insects, the spider is the most sagacious; and its industry is not less surprising than that of any other animal whatever. Goldsmith gives an example of the exceeding industry and perseverance of a house spider, which I extract from his works for your entertainment. "I perceived, about four years ago (says he), a large spider in one corner of my room, making its web; and though the maid frequently levelled her fatal broom against the labours of the little animal, I had the good fortune then to prevent its destruction; and, I may say, it more than paid me by the entertainment it afforded.

In three days the web was, with incredible diligence, completed; nor could I avoid thinking that the insect seemed to exult in its new abode. It frequently traversed it round, examined the strength of every part of it, retired into its hole, and came out very frequently. The first enemy, however, it had to encounter, was another and a much larger spider, which, having no web of its own, and having probably exhausted all its stock in former labours of this kind, came to invade the property of its neighbour. Soon, then, a terrible encounter ensued, in which the invader seemed to have the victory, and the laborious spider was obliged to take refuge in its hole. Upon this I perceived the victor using every art to draw the enemy from his stronghold. He seemed to go off, but quickly returned; and when he found all arts in vain, began to demolish the new web without mercy. This brought on another battle, and, contrary to my expectations the laborious spider became conqueror, and fairly killed his antagonist.

Now, then, in peaceable possession of what was justly its own, it waited three days with the utmost patience, repairing the breaches of its web, and taking no sustenance that I could perceive. At last, however, a large blue fly fell into the snare, and struggled hard to get loose. The spider gave it leave to entangle itself as much as possible, but it seemed to be too strong for the cobweb. I must own I was greatly surprised when I saw the spider immediately sally out, and in less than a minute weave a new net round its captive, by which the motion of its wings was stopped; and when it was fairly hampered in this manner, it was seized, and dragged into the hole.

In this manner it lived, in a precarious state; and nature seemed to have fitted it for such a life, for upon a single fly it subsisted for more than a week. I once put a wasp into the net; but when the spider came out in order to seize it as usual, upon perceiving what kind of an enemy it had to deal with, it instantly broke all the bands that held it fast, and contributed all that lay in its power to disengage so formidable an antagonist. When the wasp was at liberty, I expected the spider would have set about repairing the breaches that were made in its net, but those it seems were irreparable; wherefore the cobweb was now entirely forsaken, and a new one begun, which was completed in the usual time.

I had now a mind to try how many cobwebs a single spider could furnish; wherefore I destroyed this, and the insect set about another. When I destroyed the other also, its whole stock seemed entirely exhausted, and it could spin no more. The arts it made use of to support itself, now deprived of its great means of subsistence, were indeed surprising. I have seen it roll up its legs like a ball, and lie motionless for hours together, but cautiously watching all the time; when a fly happened to approach sufficiently near, it would dart out all at once, and often seize its prey.

Of this life, however, it soon began to grow weary, and resolved to invade the possession of some other spider, since it could not make a web of its own. It formed an attack upon a neighbouring fortification with great vigour, and at first was as vigorously repulsed. Not daunted, however, with one defeat, in this manner it continued to lay siege to another's web for three days, and at length, having killed the defendant, actually took possession. When flies happen to fall into the snare, the spider does not sally out at once, but waits patiently, till, by ineffectual and impotent struggles, the captive has wasted all its strength, and then he becomes a certain and easy conquest.

To complete this description, it may be observed, that the male spiders are much less than the female, and that the latter are oviparous. When they come to lay, they spread a part of their web under the eggs, and then roll them up carefully, as we roll up things in a cloth, and thus hatch them in their hole.

As soon as ever the young ones leave their artificial covering, they begin to spin, and almost sensibly seem to grow bigger. If they have the good fortune, when even but a day old, to catch a fly, they fall to with good appetites; but they live sometimes three or four days without any sort of sustenance, and yet still continue to grow larger, so as every day to double their former size. As they grow old, however, they do not still continue to increase, but their legs only continue to grow longer; and when a spider becomes entirely stiff with age, and unable to seize its prey, it dies at length of hunger."

In the West Indies and other warm countries there is a species of spiders known by the name of mason-spiders, which do not form webs like the foregoing, but dig holes in the earth of about three inches in length, and one in diameter. This cavity the animal lines with a thick compact material of the same description as the spider's web, and which, when taken from the ground, resembles a purse. The most wonderful part of this curious structure is the door or lid, which is of about the size of a crown piece. It is nicely and strongly joined at one part to the opening of the nest, and the material being quite elastic, an excellent hinge, having the property of shutting the door spontaneously, is thus formed. You may well ask, my dear little boys, how a poor spider, living in the ground, and without instruction, knows how to construct a nest so ingenious as that which I describe—how it possesses the art of forming a hinge as nice as that you see on any sort of box? But in this we only see another instance of the wonders of nature. The spider makes its door and its hinge entirely by the force of natural instinct, or a knowledge which has been wisely given to it by the Creator.

No. 99. SATURDAY, DECEMBER 21, 1833. PRICE THREE HALFPENCE.

PROMPTITUDE.

To be prompt in action, is a most invaluable qualification. The man who is constantly in doubt is incapable of managing great affairs. His knowledge may be extensive, his penetration quick, his understanding enlarged, his imagination vigorous; he may be candid and courteous, generous and noble-minded; he may possess every quality which is calculated to fascinate in conversation, and be able to explain difficult cases with such plausibility as to make all who hear him believe there is nobody better fitted for business: still he is worse than useless in action. He sees clearly the advantages that must result from the success of a scheme; but then he perceives with equal distinctness the obstacles which stand in the way of its execution. He weighs the one against the other, and over again weighs them; and he cannot arrive at a decision. No man understands all the niceties—the logical distinctions—of a question half so well, or deliberates half so profoundly, as he does; but nobody can be less the better of a piercing reach of thought, and a painful exercise of the faculties of judgment: for with him the end of all is the hopeless exclamation, "What to do, I cannot tell!" In the mean time, opportunity flies; and he enters upon the consideration of some other matter with the same unprofitable waste of thought. It is extremely hazardous to employ persons of this description in any transaction of importance, unless their part in it be such, that, like sailors, they are told "they have no business to think;" but as companions or counsellors, their value is considerable, because they drop numerous hints, which, used by those who know how to use them in time, turn out to be of infinite consequence.

In war, irresolution is especially disastrous. The general, sitting in his tent with his principal officers, may "deliberate in cold debate" until the enemy enter, and call upon them to surrender. Julius Cæsar used to say that great exploits ought to be executed without waiting for consultation, lest the contemplation of danger should cool the first ardour of courage. Promptitude of decision and of action are, besides, indispensable in commanders, inasmuch as their motions and actions are for the most part sudden, on account of the daily occurrence in a campaign of events and vicissitudes which could neither be foreseen nor provided against. In these circumstances, presence of mind is of greater advantage than a head more sagacious but slow in its operations, and often achieves the most splendid victories. Great conquerors have commonly possessed this quickness of capacity in an eminent degree; as may be instanced in Cæsar, and, above all, in Bonaparte. A readiness of repartee is also of no small consequence, on some occasions, to the leader of an army. Two or three words aptly thrown out in the heat of the moment, produce much more effect upon soldiery than a studied and stately harangue. "England expects every man to do his duty" was far more inspiriting than all the speeches in Livy would have been, if they had actually been delivered.

Indecision and irresolution fail in all; the power of deciding in sudden emergencies, and vigour in action, gain a part; but it is only forethought and prudence that secure permanent benefits. People are too apt to imagine, that what is called "the nick of time" is a period which arrives, unexpectedly, but once in a man's life—that "the tide, which, taken at its height, doth lead to fortune," offers to the adventurer no more than a single flow—they sit down accordingly, and "wait to see what will cast up," resolved that no minor occupation shall engross their attention, and prevent them from snatching the grand opportunity when it comes. This conduct is as foolish as it would be to remain at the bottom of a mountain in the hope of acquiring agility enough to leap at once to the summit, in order to avoid the labour of ascending step by step. There are undoubtedly some events which promote a man's fortunes more than others, and seasons when his affairs begin to prosper better. But the wise man knows that these seldom happen fortuitously. What is "the nick of time?" It is the moment when the iron is hot enough for hammering—the industrious smith knows it well, and *brings it about for himself* hundreds of times in a day. When is the tide fortunate? Whenever it flows deep enough to carry the ship out of harbour—the prudent merchant *knows its periods*, and has his vessel ready loaded to sail with it. These, and such as these, are the lucky eras "in the affairs of men:" they present themselves, not once in the "threescore and ten years," nor once in a year, but daily, hourly, every minute; they who embrace them, thrive; they who neglect them, never do well. "The nick of time," we might have said, is nothing else but the present time, which always brings with it something needful to be done—some duty, manual or mental, to be performed. If these be not in their turn regularly accomplished, we not only miss "the nick of time" now, but throw ourselves out of all reckoning with regard to it for the future.

The man who finishes his work—of whatever kind it may be—in due season, need scarcely fear that he will ever experience any disadvantage from the want of presence of mind. He is always unembarrassed, and whatever comes to his hand, he is ready to execute. Few emergencies harass him, because he is prepared for them beforehand. On the contrary, he whose indolence or folly causes him to procrastinate, is always in a hurry, and never does any thing well. He can never extricate himself from confusion; and a small thing is to him an emergency, inasmuch as, when the time for undertaking it arrives, he is never ready to begin. The business of to-day he puts off till to-morrow; and when to-morrow comes, finding he has the work of two days on his hands, and that to go through it would cost him unusual labour, he says to himself once more, "It will be time enough to-morrow," and postpones all till the third day. Thus he proceeds, accumulating in his progress a multitude of dilemmas, from which no earthly prudence or presence of mind is capable of extricating him. We have known men of this kind, who led far more laborious lives, every thing considered, than those who did three times as much work. They would forfeit their sleep two nights in the week, slaving and toiling at a business, which, if taken in proper time, and by proper arrangements, could have been very easily accomplished. To act wisely, therefore, in the business of life, we must always combine forethought with promptitude—we must bring *mind* into play. A well-disciplined mind, which, at a glance at all sides of a subject, can see where the difficulties lie, and how they are to be surmounted, is seldom at a loss in acting promptly and yet prudently. Promptitude without forethought, or the power of acting wisely on the spur of the moment, is of no use, or worse than useless, for it amounts to precipitancy; besides, it is often necessary, in human action, to proceed with deliberate caution—to go on patiently for a time in a dull routine of duty before the period arrives that is to produce the glorious result we anticipated. This is eminently the case in all that relates to works of art. The famous Michael Angelo, who was very long about his works, said, "that in arts haste was good for nothing, and that as nature takes much time in forming what is to last long, so art, which strives to imitate nature, ought to work leisurely; it being impossible for man to do any thing that is excellent in haste." Thus, even in some of the higher departments of art, where genius comes into play, long labour and careful execution are indispensable to success. Those who work at ordinary professions may likewise be assured that prudence and persevering industry are no less necessary in their case, and that the only way to hit "the nick of time" is, to be constantly busy in their employments.

THE LITTLE MAN WITH THE WIG.

One morning, I was about to leave Kendal by the stage-coach for the south. While the vehicle was getting ready, I ascended to the box, which, for many sufficient reasons, I always select in good weather. There I spread my cloak on the seat, by way of establishing my right of prepossession; and as the coach was not to start for some minutes, I descended to stretch my legs—not that I was then in need of such exercise, but perhaps from some vague idea of meeting the coming disease. On returning to re-ascend, what should I behold but a little shred of a man occupying the place which I had laid out for my own comparatively portly person! He was an old withered little creature, dressed in a brown greatcoat, and a grey worsted wig; and it was evident, from the firm projection of his under lip, and the keen settled eye with which he regarded me as I approached, that his mind was completely made up on the subject of his intrusion. I addressed him, nevertheless, with a respectful request that he would give me that place, which he might observe from my cloak, had been bespoken before he came upon the ground. "I am first here," said the little man, in a broad Cumberland dialect, "and ma mooney is as good as yours, I reckon." "But the rules of travelling, sir," said I mildly. To all my remonstrances, however, he only answered, "Ma mooney is as good as yours;" and so I had to give up the point.

I was entreated to go inside, where there was only a single lady; and though it is as hard to be obliged to take an inside place instead of an out, as it is to drink porter in place of small beer, I half thought of complying; only, while I put on my gloves, I begged the coachman would understand, that, in case it rained, which I foresaw it would (and some drops fell in confirmation of my opinion), we were not to be intruded upon by wet outside passengers. "Oh!" said the little man, "I can put oop my umbrella." "Yes," I replied, "if you want to bring the lightning upon yourself and the coach!" "It wont thoonder, will it?" "It looks like it, sir," said the coachman drily. "Then I am in!" said the little man. "I protest against *that*," said I. "I'll pye the deefference," said the little man, and down he swung. The money was pocketed, and I took my seat on the coach-box. The sun immediately shone forth, having been merely raising the vapour for the forenoon, and we set off with the usual noise and velocity.

The drive for several miles was delightful, and the coachman was good enough to pause a minute at Leven Hall, that admirable specimen of an old English manor-house, so as to admit of our enjoying the sight of its antique gardens. We had not been again in motion above a minute, when something like a female scream from the interior broke through the rattle of the wheels. "What can the little man in the wig have been doing—what is it?" burst from us all. It soon appeared that the little man in the wig had stretched out his head to see the gardens, and, in pull-

ing it back, had knocked off his hat, which was lying a little way behind on the road. This he pointed out to the coachman, who, contrary to all proper rules, but with abundance of good nature, went back to fetch it.

The horses had just started when another shout was heard, louder than before, from the same little wretch in the wig. It appeared he had lost his insufferable wig at the same time with his hat, but only missed it upon finding his hat too large. With equal promptitude, but less good will, the coachman went back again and brought the wig, but vowed he would not alight a third time, if he should have lost his head. This served for the first stage.

We reached Millthorpe, and changed coaches; but that was not generally known. We had hardly started, therefore, when there was again a tremendous shout. What now? The same ever troublesome passenger. He had been dosing in the left coach, and only aroused by a stable-boy going to clean him out! A fat man in black, who sat behind, was the announcer-general of these disasters, and gave them at last in such a quiet matter-of-course form, that it began to be perfectly ludicrous.

We now came to another stage, where the passengers again got down. In a few minutes, a horse in the stable gave a scream, such as he does when he is angry and kicks, and presently there was a rush to the stable-door. "Oh, nothing more than our old friend, the little man with the wig," quoth the man in black, turning quietly away; "he has been going too near a horse, and has been kicked." The little fellow came out, looking most ruefully. "The ungrateful brute! I only poot ma hand on him in kindness!" said he; and finished the sentence by squeezing his knee. "He doesn't understand you," said the coachman; "come, bundle in." "I would rather go a-top," said he, "and there is room." "Well, well." I had given my seat to the lady, who felt the coach too close, and I began to find the country not interesting; so I went inside, and was alone. To divert myself in these circumstances, I began of course to think of home, which to every man is or ought to be a refuge of pleasant thought.

Crash!—Hallo! "What's that now?" cried the coachman. "The little man in the wig," quoth the man in black. "What has he done?" "Only broken one of the coach windows." "Well, if a have broken a window, I'll pye the window." "You have broken it," said I; "and, what's more, my meditations." "Your what?" "A meditation, sir, that I wouldn't have had broken for money." "If t'ou canst show me that I ha' broken ony thing that had a reet to be in ma waye, I'll pye it—a can do no more." The little fellow, in trying to find ease for his bones, which were probably cropping out a little too much, had turned to the side of the coach, and one of his boots, not being restrained by the slackened sinews of his knee, had come in contact with the pane. The damage, however, was paid, and we soon after reached Lancaster.

Here we had a certain time given us, in order to see the town; and in due season most of us were once more at our posts. "All right!" cried the guard, and the coach drove off. "Noa, noa!" shouted something behind us; and the coachman looked back. "What is it?" said he. "The little man with the wig!" quoth his old cicerone. The coachman (a new one) could hardly keep his seat with laughter, as he saw the tremendously indignant stare of the little man, while he reproachfully held up his watch. "Ma time is not oop by many minutes," said he. "Look at the clock," said the coachman. "A don' mynd the clock; ma watch is reet, and I'll mantaane it. Bou't her only ten days ago, and cost me four pound." "Then," said the fat man in black, "she's a dead bargain, for I see she is not going." "Not goan! a most ha' forgotten to wind her oop, a most." "No matter—mount!" and with that he once more took his seat, and we proceeded.

There are few objects of particular interest on this road for many miles; our chief amusement, therefore, was in looking after the gambols of our little traveller, and noticing how uniformly and ingeniously he contrived to be all but left behind, and this apparently without the least intention.

The coachman, it chanced, was exceedingly morose, and the old man saw it. He could therefore have no intention of using freedoms, yet every time we started after a halt, it was necessary to draw up; and the answer as to what was amiss was uniformly, "The little man with the wig!" At one time he had gone off before us, and there was first a buzz among the passengers, and then a general request to stop. "What is it?" "Only the little man with the wig; he is not in his place." He was now sought for, but could not be found. "Perhaps he left here?" The way-bill was examined. "No; he is booked to Liverpool." "Must find him then." "No; can't stop for any man. My time is up." And, after every inquiry, he was abandoned to his fate; but we had not proceeded five minutes, when there was a screech from the road-side from the object of our inquiry. While we were seeking him, that he might not be left behind, he had manfully walked on, and was wondering what had become of *us*, and even held up his watch in accusation.

At a little place near Preston, we had halted to change, and one of the horses was said to have met with an accident. He must do his work, however, and the coachman had mounted, when all at once it was discovered that this wretched creature was again absent. He had gone to examine the accident, about which he knew nothing, and never dreamt of noticing that the coachman was on his box. "Strap him down with the luggage!" shouted the coachman, as the little fellow was hurried away. The guard said he would certainly get killed or lost, and we were all of the same opinion. The most ludicrous thing was the look of astonishment with which he always found himself in fault. All experience seemed thrown away upon him. He was as much taken by surprise at the fiftieth as at the first mistake. He had hardly cooled from one fret till he was in another. Scrape followed scrape, and misfortune chased misfortune, and yet the chance of farther scrapes and misfortunes seemed still undiminished.

At Preston the case became more serious than ever. He had got down as usual, and was standing at once in sight, and quite out of danger, and this by the express direction of the coachman, who at last began to relax so far as to notice the singularity of the old creature's adventures. While we were all enjoying this, and even the old man himself half joining with us, there was a scream from the people about us, and, looking round, what was it? A coach had come up, and was dashing through the archway leading from the inn-yard, when, who should be in the way but—the little man with the wig! While looking at us, he was struck by the pole, and, clinging to it, was stuck up like a forked radish upon the stone that guarded the wall, the pole close to his throat, but fortunately not upon it. His look was indescribable. It seemed to say, as plainly as look could speak, "There now! you see that, by following your directions, I am in more danger than ever!" He was picked out of his perilous situation, and hurried into the coach—the coachman half laughing, and declaring that it would not be possible for him to deliver him safely. At last he was in, and there were no farther stops; consequently, we concluded that our sport was ended. But not so. He came out on the road at the place of his destination. The bundles he had appeared almost innumerable; and the coachman, as every successive one was pulled out, cried, "is that all?" and was answered, "just another, if t'ou'lt have the kindness." At last the whole seemed to have been discharged, and the little man paid his trifle, the coachman declaring he had never worked so hard for any thing in his life; so we started, congratulating ourselves on our escape. "Hallo!" from the guard. "Eh! any thing wrong?" "Yes, the little man with the wig!" said our obese friend once more. "Tou didn't see a green striped carpet bag," said he, almost breathless, "did'st tou?" "What! was that yours?" The guard again opened his receptacles; again rummaged them—not there! "What is it you're seeking?" shouted his friend from the door at which he had stopped, at the same time holding up the carpet bag, already delivered. "Ah! a ha' gotten it!—all reet—good day to you;" and for the last time we saw the tormenting little man with the wig!

So ends this tale of a coach goblin—for, at the time, I could hardly consider him in any other light. Perhaps, at home, as Bob Acres says, and out of harm's way, the little man with the wig was a most respectable member of society. It was evident, however, from his proneness to coach accidents and scrapes, that he was a man who, in circumstances at all extraordinary, and when forming part of a social system, was calculated to derange his own comfort and that of every person in contact with him—not perhaps from ill dispositions, but from want of attention and punctuality. There are many such characters in life; but I never met with one in a more extreme or more amusing form than the LITTLE MAN WITH THE WIG.

THE MUSCULAR POWER OF ANIMALS.

THE muscles of an animal are a bundle of soft red cylindrical, and nearly unelastic threads, formed out of a substance called by chemists fibrine; which, when microscopically viewed, are seen to divide and subdivide into still smaller bundles of thread, parallel to each other, and bound together by a delicate cellular net-work, obviously of a different nature. They are uniformly accompanied through their course by a number of very minute nerves, which are cords or tubes that originate from the brain, and branch out in every direction, by which means a perpetual communication is kept up between the sensorium and the remotest parts of the body. While the sensitive fibres of the ear are excited by the stimulus of sound, those of the eye are only excited by the stimulus of light, the one remaining totally unmoved by that which puts in motion the nerves of the other. The lungs are excited by the stimulus of the air; the stomach to that of digestion, by the stimulus of the food introduced into it; the heart by the stimulus of the blood, and so on; and every sensation, as it occurs, is instantly conveyed by the nerves to the brain. But the brain, which by this means receives intimation of the different actions occurring throughout the system, has a voluntary motion originating in itself, the will being the exciting cause, giving birth to what is called the stimulus of volition, and thus bringing into action the external powers of the body.

By this it appears that there are two distinct systems in the mechanism of the body, the one animate, the other inanimate, which in one case the living power exercises an influence totally different from the other.

Various calculations have formerly been made relative to the functions of the animal frame, which in their results have been curiously at variance: Borelli estimated that the force with which the heart must contract, in order to cause the circulation of the blood in man, is equal to not less than a hundred and eighty thousand pounds weight at every contraction; while Keil could not estimate it at more than eight ounces. Borelli, in applying the same theory to the power with which the human stomach digests its food, calculated it, in conjunction with the assistance it receives from the auxiliary muscles, which he conceived to divide the labour about equally with itself, as equal to two hundred sixty-one thousand one hundred and eighty-six pounds; and Pitcairne has made it very little less, since he estimates the moiety contributed by the stomach alone at one hundred and seventeen thousand and eighty-eight pounds, which gives to these organs jointly a force more than equal to that of twenty millstones. "Had he," says Dr Monro, "assigned five ounces as the weight of the stomach, he had been nearer the truth."

The digestive functions are now so perfectly understood, that the above theory is of course altogether overthrown; for although the stomach participates in a small degree in the process of digestion, yet this important operation is almost entirely performed by a powerful solvent, secreted by the stomach itself, called the gastric juice, and which answers all the purposes which the most violent muscular pressure could produce, and at the same time with the utmost simplicity of contrivance.

With regard to the circulation of the blood, so far as it is now understood, it is caused by a double projective power, one portion being dependent on the living principle in the heart, and the other on the vacuum produced in the heart by that contraction which has propelled the blood, returned from the lungs into the arterial system, whence the heart itself becomes alternately a forcing and a suction pump, having the former in respect to the arteries, and the latter in respect to the veins. Different persons, though of the same size and appearance, do not possess uniformly the same strength, for the fact is well known, that the muscular powers of the human body become greater in proportion to their being used, provided they are not exhausted by violence or over-exertion. It has been calculated that the average weight carried by a stout porter in the city of London averages about two hundred pounds, while it is said that there are porters in Turkey, who, by accustoming themselves to this kind of burthen, can carry from seven hundred to nine hundred pounds. Some years ago there was a man at Oxford who could hold out his arm extended for half a minute, with half a hundred weight hanging on his little finger.

The following estimate of the comparative powers of men, horses, engines, and mills, may be found interesting:—The common labourer may be said to employ a force capable of raising a weight of ten pounds to the height of ten feet in a second, and continued for ten hours a-day. A moderate horizontal weight for a strong porter, walking at the rate of three miles an hour, is two hundred pounds; the chairman walks four miles an hour, and carries one hundred and fifty pounds; the daily work of a horse is equal to that of five or six men upon a plane, but from his horizontal figure, if drawing up a steep ascent, it does not exceed the power of three or four men. In working windmills, twenty-five square feet of the sails is equivalent to the work of a single labourer; and a full-sized mill, provided it could be made to work eight hours a-day, would be equal to the daily labour of twenty-four men. A steam-engine of the best construction, with a thirty-inch cylinder, has the force of forty horses, and, as it acts without intermission, will perform the work of one hundred and twenty horses, or of six hundred men daily, every square inch of the piston being equal to the power of a labourer.

The consideration of the wonderful power of the human muscles naturally leads us to the contemplation of those possessed by the inferior animals. The elephant is capable of carrying a burden of between three and four thousand pounds with its trunk, which has been calculated to consist of upwards of thirty thousand distinct muscles. It snaps off the stoutest branches of trees, and tears up the trees themselves with its tusks. The lion, with a single stroke of his paw, can break the back-bone of a horse, and runs off with a buffalo in his jaws at full speed. In the tail of the whale lies the chief strength of the animal: with this powerful instrument it shatters the long-boat of a ship to pieces. The shark, which is often thirty feet long, and of not less than four thousand pounds weight, has been known to swallow a man whole at a mouthful. The eight-armed cuttle-fish, found in the Indian seas, has arms nine fathoms in length; and when lashed round a man, it is found so very difficult to escape, that the Indians always carry a hatchet with them in their boats, to cut off the arms of the animal should he attempt to lay hold of them and drag them under water. And such is the strength

possessed by the eagle of the Alps, that it has been frequently known to carry off children in its talons.

Among the insect tribe, a wonderful diversity of muscular powers are discovered: there are many species which unite in themselves all the powers of motion which are possessed by the superior animals separately. They can walk, run, swim, or fly, with as much ease as quadrupeds, birds, and fishes. Such a combined medley of locomotive functions must require an equal diversity of motive power, and such is the fact. In the mere larva of the caterpillar, when in a state approaching to a butterfly, Lyonet has discovered not less than 4061 distinct muscles, which is about ten times the number that belong to the human body; and it is probable, that, when the insect arrives at its perfect state, the number will be much greater. The phosphorescent springer, a winged insect, has the extraordinary power, that, when laid on its back, it can spring up half a foot in order to recover its position. This insect, also, secretes a light, so much stronger than that of the common glow-worm, that a person may see to read the smallest print with it at midnight. Crabs and spiders can throw off an entire limb, when seized by it, in order to make their escape. The land-crab travels once a-year from the woods which it inhabits to the sea, to deposit its spawn, which sinks into the sands at the bottom of the sea. After a short time, millions of little crabs thus hatched are seen quitting their native element, and making their way to the woods. The hinge of the common oyster is a single muscle, and that belonging to the great clam-fish is no more. This animal is of the oyster kind, and has been taken in the Indian Ocean of a weight not less than five hundred and thirty-two pounds, sufficient to furnish a hundred and twenty men with a meal. It is able, by the means of this single muscle, to cut off the hand of a man, or snap asunder the cable of a large ship.

AN EAST INDIAN STORY.

About two years before my arrival at Bombay, a Lieutenant Bellarmine had disappeared in a mysterious way, which left it uncertain whether he had fallen in a skirmish with a body of Pindarees, or if, as was reported on some unascertained authority, he had joined these wild depredators, and remained willingly in some of their fastnesses. His previous habits gave a sort of colour to this strange story, for he was known to be a rash, thoughtless lad, distinguished for his bravery, but continually involved in all sorts of quarrels and debt. He was on this account out of favour with most of the superior officers, but was, notwithstanding, a good deal liked in society, from the frank, generous tone of his conversation, and a certain rattling agreeable merriment, which used to thaw the stiffness of Bombay hospitality into involuntary good humour. To these qualities he probably owed his union with a very amiable woman, whom his irregularities and ultimate disappearance left at the presidency in a state little short of distraction. His own fate only gave rise to wonder and curiosity, but that of his wife excited universal commiseration. Had there been authentic accounts of the death of her husband, her situation would have been much less distressing; for she could then have embarked at once for England, where, though her friends were poor (as was reported), her allowance as an officer's widow would at least have placed her above want. In her present situation she was pitied and respected by every one. No aid that she could have wished for was awanting, but she uniformly declined every attention, except that of one or two friends, relations, it was understood, of her husband. It was at the residence of one of these gentlemen that I first saw her.

During the dry season, the English inhabitants of Bombay generally quit their houses within the confined walls and streets of the town, and betake themselves to temporary residences erected on a small green plain between the fortification and the sea. Some of these annual edifices are spacious erections, with a court-yard, stables, kitchen, huts for servants, &c., all constructed of poles and the woody reeds of the country; the dwelling-places being made tight by a coat of clay plaster; another set of residences consist of large tents, which are generally occupied by gentlemen of the military service, and whose clean white appearance as they stand scattered over the green, with the black servants moving about among them, and the horses or sometimes a camel piquetted in front, give peculiar animation to the scene. It is best enjoyed from the opposite rising ground on the Bombay esplanade, where the sea in the distance, and the background of the little island of Colabah, studded with palm-trees, are added to the picture. I had been out one evening with a military friend, of the name of Malloch, on this walk, and had lingered till long after sunset, enjoying the coolness of the sea-breeze. The tents still glittered white in the star-light, and we were sauntering along slowly, sometimes stopping to mark the figures that were in motion about the little camp, and once or twice to gaze on a group or two of dancers in front of some of the tents. One party who seemed to enjoy the exercise with much animation had two flute-players, whose music gave them an additional attraction. The scene altogether was uncommonly pleasing; but Malloch, whose attention was fixed entirely on the music and dancing, after gazing till his enthusiasm was kindled, suddenly called out, "It is Eastlake's tent, I declare: let us join them; there is a lady there just now whom I have long wished to see." "We may go, I dare say," said I, knowing how difficult it would be to keep back my impetuous companion, and aware that we could meet with nothing but the kindest reception from my gallant friend and his hospitable lady.

We accordingly paced downwards across the esplanade, and, leaping the rail by which it is surrounded, soon found ourselves approaching the dancers. The vivacity of the scene was greatly heightened as we drew near and could distinguish the appearance and even the voices of some of the party; but I began at the same time to feel the awkwardness of intrusion, and wished I had been less ready in yielding to my flighty companion. Just in time to save us from embarrassment we met my friend Major Eastlake, who had himself come out so far from the tent in order to enjoy the scene at a little distance. He immediately invited us to join the party; and as we accompanied him thither, he mentioned that he had received directions to take the command of a detachment ordered to embark in a day or two for Ahmednuggur, and that some of his friends had come to bid him adieu on that occasion.

When we joined the company, each of us found several acquaintances; and Malloch was very soon engaged with the dancing and music, being himself an admirable performer on the flute. After some time, he began to look round for a partner; and passing by the ladies who were nearest, he went to address himself to one who sat by herself—with some appearance of being neglected—in a corner of the verandah. I observed that his first motion towards her was noticed by Major Eastlake with a kind of displeased surprise, and that he made a step as if to arrest my companion's intention; he was, however, too late; Malloch, with his usual impetuosity, having already approached and requested the honour of her hand. The lady only replied by a slight shake of her head, and a motion of dissent. At the same moment, Major Eastlake came up, and said to her, with a peculiar manner, which Malloch ought certainly to have felt as a rebuke, "this is my *friend* Mr Malloch, madam; Mrs Bellarmine does not dance, Mr Malloch." Malloch, who of course knew the history of the young lady, seemed hurt at his own forwardness, and answered by a respectful bow, begging pardon for his intrusion, but hoping that Mrs Bellarmine would not be offended. The lady only answered by a very slight inclination of her head, and a melancholy smile, while Major Eastlake listened to every word with obvious impatience. Malloch was at length led away, and immediately came to the seat next mine. "What a lovely creature!" he said; "she is more beautiful than ever." "More beautiful than ever!" I replied; "you have seen Mrs Bellarmine before, then?" "Years ago," answered he. "I saw her before she had any thoughts of coming to India, or being left in this deserted state, by the fool whom she married. I wish you could be introduced to her." "Not if it were to drive me mad, as it appears to have done you, Malloch," I said; "you should have respected her seclusion from the company; and I hope you will recollect how highly she is regarded by Major Eastlake and his lady." "Oh, she does not need their recommendation to me: but I am acquainted with Mrs Eastlake; the major is a stiff old boy, but he is going in a day or two, and I shall then have a better introduction than his.

As he was speaking, I observed Major Eastlake's attention directed towards me, and a slight motion intimated his wish that I would make my way to him. I was soon by his side; and after a few words on indifferent matters, he said, "I notice that your acquaintance is inclined to direct his attention towards our poor friend Mrs Bellarmine. I know that any thing of that kind—particularly from a volatile person like Malloch—is disagreeable and inconvenient to her; and I therefore take the liberty of imposing on you the task of guardian, which no one else can undertake so well without the risk of offending your friend, or of being officious to Mrs Bellarmine." I bowed, as to one whose good opinion I highly valued, and he immediately turned and introduced me to the lady. She looked up, and I think I never beheld a face of more engaging loveliness; she was dark-haired and dark-eyed, with something of the usual paleness of English ladies who have resided a few years in India; but her complexion had a purity and brightness which I have seldom seen equalled; and her fine regular features, though marked with settled melancholy, responded with quiet intelligence to every thing she deigned to notice in conversation. I entered into discourse with her for a few minutes, and found her a remarkable exception to most of our oriental dames, who are generally brimming over with all manner of gossip, about matters of precedency at balls, scandal at private parties, the debts and embarrassments of acquaintances, and all the other nick-nackeries of their limited society. She either did not know, or did not speak of these matters; and I was thrown upon literary conversation in order to say something. She answered here with intelligence; and I soon found that she lived in a secluded land of poetry and imagination, which is but little trod by oriental ladies. Her sorrow and retirement had blunted her relish for society, but had not destroyed her mind. All her tastes, however, seemed of a serious character: Cowper, Beattie, Graham, Montgomery, supplied her with the richest and most beautiful allusions; but of the fierce, mistrustful, and irregular Byron, she did not seem to recognise a line. The readiness with which she appreciated my remarks, and the overflowing yet delicately selected stores of her own memory, made me no longer wonder at the deference with which she was regarded by the few friends to whom she allowed herself to be known.

As we were departing, Major Eastlake said to me "You will not now wonder at the interest we take in Mrs Bellarmine. Her situation is rendered more painful by the conflicting rumours which are continually brought concerning her husband, to whom she is sincerely and devotedly attached; for, notwithstanding his follies, he knew and respected her value. Her distress, I really believe, arises chiefly from the imputations which have been cast on his honour. For myself, I give no credit to them. I know that poor Henry was rash and imprudent; but he was a soldier-like spirit, and could never have turned renegade. My new situation will soon give me the power of making effectual inquiries concerning his fate. If he is alive, I shall certainly find means to reach him, and, if he has fallen honourably, it shall be ascertained. In the meantime, I beg again to repeat my charge, for I have heard and seen enough of Mr Malloch to fear that he is capable of causing uneasiness." He took leave of me with these words, and I did not see him again before he embarked.

His precautions, however, rather accelerated what he feared. Malloch was piqued at the notice bestowed upon me; and he had not boasted in vain of his acquaintance with Mrs Eastlake, who by no means took the same interest in the fate of Lieutenant Bellarmine as did her uncle the major; and firmly believing him to be dead, she had even great pleasure in the prospect of managing a new match for his widow. Malloch had even the art to render my visits somewhat less acceptable to this lady than they were wont, so that I had but few opportunities of learning what was going on. Once or twice when I called, Mrs Bellarmine spoke to me with feelings of the deepest regard concerning her husband, without seeming once to have had her confidence in him shaken; and she mentioned, that, if Major Eastlake ascertained any thing concerning him, he would write first to me on the subject. I alluded once to the circumstance which Malloch had mentioned, that he had met her in England. "Captain Malloch is Mrs Eastlake's guest here," she said, "and I can do nothing that is rude to him; but at no period, either in England or in India, have I seen reason to consider him a man of delicacy or honour." She said no more, and the subject was not again alluded to.

One day, when I had called at the house, something led me into the garden, and I was assisting the *malee* (native gardener) to train up some oriental jessamine on the end wall of a back verandah. Mrs Bellarmine had entered this part of the house in the meanwhile, and Captain Malloch, who had also arrived, joined her there. All this I gathered from conjecture; but being separated from them only by a slight partition, not in very good repair, I was apprised of their presence by the sound of well-known voices. I could not escape from hearing the following fragments of their conversation:—

"My dear Mrs Bellarmine, how often have I repeated, that your image has never once been absent from my mind since I first saw you at Greenside."

"I was then a governess in the family of your relation, Mr Malloch; and your attentions were at that time neither more agreeable nor more honourable to me than they are now. I beg you may desist from language to which I dare not, and will not listen."

"Dare not! how often have I told you that Bellarmine will never return. He was a man I never esteemed, were it for nothing but his conduct to you; but I must say that he died as a soldier should."

"How have *you* obtained this information, Mr Malloch?"

"I know more about Bellarmine than you suppose. I was in the same district with him at the time of the skirmish where he fell; and it was a foolish joke of mine (though it was never known) that gave rise to the absurd rumour about his having joined the enemy."

"Good God!" exclaimed Mrs Bellarmine; and then, suddenly restraining herself, she said, "perhaps your present story is a joke also."

"My dear Mrs Bellarmine, if you doubt my word, look at that letter which I have received from a serjeant who was on the field with him."

There was silence for a few minutes, only that I heard a deep sigh from the female speaker, and, in a moment after, a shriek, and then a sound as if some one had fallen down.

I hurried round to the front door, but before I could gain admission, there was a crowd of servants collected in the verandah, and Mrs Eastlake was busy chafing the temples of her friend, who lay in a swoon. Captain Malloch was standing at the opposite end of the verandah, leaning against one of its pillars, and gazing with a strange and gloomy earnestness at the scene before him. I saluted him with a manner in which I fancy he must have seen something of my present feelings, for his return was distant and haughty. It was now verging to night, and Mrs Bellarmine was removed into an inner room,

where there were lights. Malloch and I were left together, but no conversation passed; and in a short time a message was brought to us that the lady was better. I proceeded to the apartment where she was; Captain Malloch, as I observed, lingering behind, and not appearing resolved what to do.

Just as I was departing, one of my servants who had followed me thither came up, and put into my hand a letter which a *peon* (runner) had brought to my house. I took it, and went into the room where the two ladies were sitting. Mrs Bellarmine was pale, but collected, and said that she was quite recovered. Her attention seemed attracted by the unopened letter which I held in my hand; and on looking at it myself, I perceived that it was in the hand-writing of Major Eastlake. It would not be easy to describe the anxiety which the whole party now felt as to its contents: to Mrs Bellarmine's agitated mind, they seemed to hold the cup of life or death. I broke the seal. The letter was short, but full of interest.

"My Dear Sir—I am glad to say that I have obtained sure intelligence concerning our poor friend Henry: his honour is as untainted as the snow. He was made prisoner by the Pindarees, and is now confined in one of their hill-forts, where I have found means of communicating with him. I cannot as yet attempt his release, but he shall be restored to us. You may have heard that Malloch had a command in this district at the time of the skirmish; and it now appears that it was owing to some treachery or cowardice on his part that Henry's party was entrapped and surrounded by the banditti. These things will now be brought to light, as well as some mean forgeries which have been attempted of late, and of which a serjeant here has given an account. I am," &c.

I had read so far before perceiving that Malloch had by this time followed me into the room, and had heard part of the letter; at the last words, I was alarmed by seeing him at once dart out of the apartment with a look of distraction. I heard his footsteps running across the garden, but remained in a kind of mute astonishment, both at the suddenness of his action, and at the contents of the letter. I had hardly stood a minute in this state, when Bappoo, one of the servants, came running into the apartment with a look of terror, and cried, "Sahib! Sahib! Mr Malloch has thrown himself into the sea." The house where Mrs Eastlake lived (she had now removed into the town) was just within the ramparts, on that side where they run into the bay, and a leap from the parapet wall at high water was certain death, except to the best swimmers. If the dreadful announcement was correct, there was, in the present darkness, no chance of recovering Malloch.

I rushed, however, to the spot which the man had pointed out; and as soon as I got on the wall, I sprung to the top of the parapet to look down. The waters were tossing and weltering against the bottom of the fortifications, where I could distinguish nothing in the darkness but the indistinct heaving of a stormy sea, and the white foam which broke in white patches on the tops of its endless waves. To think that a fellow-creature was struggling in such an abyss, perhaps within reach of my aid—if his pride or remorse would allow him to call for it—was dreadful. As we were standing gazing in this anxiety, I heard one of the natives present (for several had now assembled) say to another, in his native tongue, "I see the fool sitting on a stone." My eye lighted at the moment on the object he had observed, which was certainly something white (the colour of the military undress worn by Malloch), and having the appearance of a human figure seated on a rock; but whether it was this, or merely an illusion caused by the foam which broke there, the darkness rendered it difficult to say. I called, however, for a ladder, with the intention of descending; and while the men were fetching it, I could not but picture to myself the extraordinary state of Malloch's thoughts (if it were he), which thus kept him fixed on a rock in an agony between suicide and the terror of dying—the ridicule of surviving and the disgrace of such a death. At this moment we were joined by another person, who had been approaching along the ramparts. He was a tall soldierly-looking man, in a dark military greatcoat, and was followed by a black servant. I was not aware of his presence, till informed by a kind of whispered intimation from an attendant. As soon as the stranger saw that he was observed, he asked what was the matter? I mentioned that a gentleman had thrown himself from the parapet, and pointed to the figure which we saw. "Why does not some one go down to him?" he asked. "A ladder will be brought directly," I answered. "A ladder!—it will never do to wait for that. Mahommed, give me your turban; or tie your turban and girdle together, and give me the end of them." A rope was soon made of the long turbans and girdles of the natives, which was held fast by these people; while the stranger, throwing off his greatcoat, slid down the wall, and dashed into the sea. We lost sight of him instantly in the tumult of waves and the darkness, and could not tell what was to be the event. In the meantime, I inquired at the servant who his master was? "It is Mr Bellarmine, sir, arrived from Chunder." I had not time to recover from the astonishment caused by this stunning intimation, when I saw him emerge from the water on the little rock; and two figures were immediately seen standing together, and, after a little time, apparently struggling with each other. This, in other circumstances, was only what was to be expected, as Malloch in his frenzy might refuse to be saved; but if they should recognise each other in such a situation, what would be the event? The ladder had been now brought; so that, taking a rope in one hand, I hurried down the wall, and swam to the spot so often mentioned. As I approached, the water shallowed a little, and I could stand upon my feet, in which situation I could hear and see what passed. Bellarmine was endeavouring to persuade Malloch to be saved; while the latter only answered by furious imprecations and oaths; at times saying, "Is it the dead come alive?—or what are you? I am mad—mad—mad—to meet Bellarmine swimming about in the sea! Get you gone, sir—I never hurt you—It is false—false." Bellarmine, who did not appear to recognise him, continued struggling to drag him towards the landing place; and in the meantime I came up, and got the rope fastened round his waist and shoulders. With the assistance of the men pulling on the top of the parapet, we now guided him through the water; and though it looks a little grotesque, had him dragged up the wall like a bundle of wet rags. I prevailed on Bellarmine to ascend before me, and we were both safe landed in a few minutes. Malloch was lying on the grass of the ramparts, and seemed to all appearance either dead or in a swoon. "Who is he? and what has caused this?" asked Mr Bellarmine. Before I could get time to answer, a serjeant's wife, who attended as a nurse in Major Eastlake's family, interposed—"Oh, it is Captain Malloch, sir; and he drowned himself, because he was jilted by that creature Mrs Bellarmine. I hope she may get a worse yet, now that her thriftless husband is dead, as Captain Malloch told me himself." The astonishment of Bellarmine at this abrupt intelligence cannot be conceived. He looked at me for explanation, which I gave him with the more awkwardness, that I had felt Malloch's pulse in the meantime, and perceived that he was only feigning insensibility, in order to escape being questioned. His odd situation may be conceived, in being thus tied down to hear the account which I had to give Bellarmine of his conduct.

The meeting which immediately took place between the long lost Bellarmine and his wife cannot be described. This amiable and ill-used lady, in now recovering her beloved husband, felt herself fully rewarded for her constancy and affection. On an explanation being made by Bellarmine, it appeared he was the bearer of documents which freed him from every shadow of blame. He was also able, in consequence of information which he had collected during his imprisonment among the Pindarees, to render services to government, which led to his speedy promotion. As for the wretched Malloch, the designer of so much evil, and whose infamous schemes had, in reality, proved ultimately beneficial to his victim, he was shunned by all who knew him; and shortly after, obtaining leave of absence, he departed to Europe, there to hide his shame, and to escape the ridicule of his various misadventures.

GAMBLING IN THE METROPOLIS.

Notwithstanding all that has been said and written in exposition of the nefarious and injurious system of gambling pursued in the gaming-houses in London, neither the constituted protectors of public morals, nor the public generally, are yet by any means aroused upon the subject. With the view, therefore, of attracting attention to this subject, we take the liberty of laying before our readers a few extracts from an excellent paper which appeared lately in Frazer's Magazine—a publication which contains many articles abounding in useful statistical matter relative to the metropolis.

"On an average during the last twenty years, about thirty gaming-houses have been regularly open in London for the accommodation of the lowest and most vile set of hazard players. The game of hazard is the principal one played at the low houses, and is, like the characters who play it, the most desperate and ruinous of all games. The wretched men who follow this play are partial to it, because it gives a chance, from a run of good luck, to become possessed speedily of all the money on the table: no man who plays hazard ever despairs of making his fortune at some time. Such is the nature of this destructive game, that I can now point out several men, whom you see daily, who were in rags and wretchedness on Monday, and, before the termination of the week, they ride in a newly-purchased Stanhope of their own, having several thousands of pounds in their possession. The few instances of such successes which unfortunately occur are generally well known, and consequently encourage the hopes of others who nightly attend these places, sacrificing all considerations of life to the carrying (if it be only a few shillings) their all every twenty-four hours to stake in this great lottery, under the delusive hope of catching Dame Fortune at some time in a merry mood. Thousands annually fall, in health, fame, and fortune, by this maddening infatuation, whilst not one in a thousand finds an oasis in the desert. The inferior houses of play are always situated in obscure courts, or other places of retirement, and most frequently are kept shut up during the day, as well as at night, as if unoccupied, or some appearance of trade is carried on as a blind: a back room is selected for all operations, if one can be procured sufficiently capacious for the accommodation of forty or fifty persons at one time. In the centre of the room is fixed a substantial circular table, immovable to any power of pressure against it by the company who go to play; a circle of inlaid white hollywood is formed in the middle of the table, of about four feet diameter, and a lamp is suspended immediately over this ring. A man, designated the groom-porter, is mounted on a stool, with a stick in his hand, having a transverse piece of wood affixed at its end, which is used by him to rake in the dice, after having been thrown out of the box by the caster (the person who throws the dice). The avowed profits of keeping a table of this kind is the receipt of a piece for each *box-hand*, that is, when a player wins three times successively, he pays a certain sum to the table; and there is an aperture in the table made to receive these contributions. At the minor establishments, the price of a *box-hand* varies from one shilling to half a crown, according to the terms on which the house is known to have been originally opened. If there is much play, these payments produce ample profits to the keeper of the house; but their remuneration for running the risk of keeping an unlawful table of play, is plunder. At all these houses, as at the higher ones, there is always a set of men who are dependents on the keepers of the house, who hang about the table like sharks for prey, waiting for those who stay late, or are inebriated, and come in towards morning to play, when there are but few lookers on; unfair means are then resorted to with impunity, and all share the plunder.

About eleven o'clock, when all honest and regular persons are preparing for rest, the play commences, the adventurers being seated around the table: one takes the box and dice, putting what he is disposed to play for into the ring marked on the table; as soon as it is covered with a like sum, or set, as it is termed, by another person, the player calls a main, and at the same moment throws the dice. If the number called comes up, the caster wins; but if any other main comes uppermost on the dice, the thrower takes that chance for his own, and his adversary has the one he called. The throwing then continues, during which bets are made by others on the event until it is decided. If the caster throws deuce ace or aces, when he first calls a main, it is said to be crabbed, and he loses; but if he throws the number named, he is said to have nicked it, and thereby wins. Also, if he should call six or eight, and throws the double sixes, he wins; or if seven be the number called, and eleven is thrown, it is a nick, because those chances are nicks to these mains; which regulation is necessary to the equalization of all the chances at this game when calling a main. The odds against any number being thrown against another, varies from two to one to six to five, and consequently keeps all the table engaged in betting. All bets are staked, and the noise occasioned by proposing and accepting wagers is most uproarious and deafening among the low players, each having one eye on the black spots marked on the dice, as they land from the box, and the other on the stakes, ready to snatch it if successful. To prevent the noise being heard in the streets, shutters closely fitted to the window-frames are affixed, which are padded, and covered with green baize; there is also invariably an inner door placed in the passage, having an aperture in it, through which all who enter the door from the street may be viewed: this precaution answers two purposes, it deadens the sound of the noisy voices at the table, and prevents surprise by the officers of justice.

The generality of the minor gambling-houses are kept by prize-fighters, and other desperate characters, who bully and hector the more timid out of their money, by deciding that bets have been lost when in fact they have been won. Bread, cheese, and beer, is supplied to the players, and a glass of gin is handed, when called for, gratis. To these places thieves resort, and such other loose characters as are lost to every feeling of honesty and shame. A table of this nature in full operation is a terrific sight; all the bad passions appertaining to the vicious propensities of mankind are pourtrayed on the countenances of the players. An assembly of the most horrible demons could not exhibit a more appalling effect; recklessness and desperation overshadow every noble trait which should enlighten the countenance of a human being. Many, in their desperation, strip themselves on the spot of their clothes, either to stake against money, or to pledge to the table-keeper for a trifle to renew their play; and many instances occur of men going home half naked, after having lost their all. They assemble in parties of from forty to fifty persons, who probably bring on an average each night from one to twenty shillings to play with. As the money is lost the players depart, if they cannot borrow or beg more; and this goes on sometimes in the winter season for fourteen or sixteen hours in succession, so that from 100 to 140 persons may be calculated to visit one gambling-table in the course of a night; and it not unfrequently happens that, ultimately, all the money brought to the table gets into the hands of one or two of the most fortunate adventurers, save that which is paid to the table for box-hands; whilst the losers separate only to devise plans by which a few

more shillings may be procured for the next night's play. Every man so engaged is destined either to become by success a more finished and mischievous gambler, or to appear at the bar of the Old Bailey, where, indeed, most of them may be said to have figured already. The successful players by degrees improve their external appearance, and obtain admittance into houses of higher play, where 2s. 6d. or 3s. 4d. is demanded for the box-hands. At these places silver counters are used, representing the aliquot parts of a pound; these are called pieces, one of which is a box-hand. If success attends them in the first step of advancement, they next become initiated into crown-houses, and associate with gamblers of respectable exterior.

The half-crown, or third-rate houses, are not less mischievous than the lowest ones. These houses are chiefly opened at the west end of the town, but there are some few at the east. In the parish of St James's, I have counted seven, eight, and nine, in one street, which were open both day and night. One house in Oxendon Street, Coventry Street, had an uninterrupted run of sixteen or seventeen years; thousands have been ruined there, while every proprietor amassed a large fortune.

The average number of these third-rate houses in London open for play, may be calculated at about twenty-five. If there were not a constant influx of tyro gamblers, this number would not be supported. Their agents stroll about the town, visiting public-house parlours, and houses where cribbage-players resort, whist clubs, also billiard and bagatelle tables; experience having taught them, that the man who plays at one game, if the opportunity be afforded him, is ever ready to plunge deeply into the vice of gambling on a large scale. Junior clerks, and the upper class of gentlemen's servants, are the men whom they chiefly attack.

The abolition of the lotteries has not lessened the evil of gambling among servants: they resort now to gambling-houses, where the sum annually played for by the servants of the present day may reasonably be laid at *one million and a half sterling*. At most of the middle class of gambling-houses, play is going on from three o'clock P. M., to five or six o'clock A. M. In the afternoon, from three to seven, it is called morning play, being generally *rouge et noir* or *roulet*. The latter is a kind of E O and *rouge et noir* blended, there being both numbers and colours on which money may be staked. The board is whirled round on a pivot, and an ivory ball set in motion the reverse way on it. During its revolution, the bets or stakes are placed on numbers and colours, on a circular but fixed exterior frame corresponding in marks to the one in motion. After it subsides, and the ball has fallen into one of the compartments of the table, the bets which are lost are drawn into the bank, and the winners paid. If the ball falls into zero (0), then all the money on the table is forfeited, excepting that which was laid on colours only, when but half is exacted, the same as at the game of *rouge et noir*. In the evening, play commences again at ten or eleven o'clock, either with *French hazard* or *rouge et noir*."

Want of space induces us to go no farther into the description of this infamous system of gambling, and we beg to refer those interested in the subject to the article from whence the foregoing is taken, in which they will find the most ample expository details. We can only express our astonishment at the laxity of magisterial authority in allowing such well-known illegal practices to be carried on, and anxiously hope that means may be adopted to check so frightful an evil. The misery produced in private society by suffering such a species of gaming is indescribable in amount. "Through the public gaming-tables (says the same writer) every year vast numbers are hurled from respectable life to associate with wretchedness and criminals, or become exiles; and many commit suicide, and leave families in want, after having been robbed of their substance by those harpies, whom our government permits to reside even within the precincts of the court. One scoundrel, who is admitted into genteel society, and resides in a magnificent house in great style, on a fortune made by the most unlawful means, in a gaming-house, was, it is said, the cause, on an average of ten years, of fifteen suicides annually, besides bringing ruin and misery on ten times that number of families in the same period. One case presents itself which can be attested by hundreds of the sufferer's neighbours, being so well known. A respectable tradesman, possessing some property, who resided in Oxford Street, was, in the winter season, accustomed to attend a whist-club, held at a public-house in the vicinity of his own residence. He was remarkably characterised for steadiness of conduct and regular habits, and was never known at one time to venture more than half a crown at any game of chance, previous to the period of which I am about to speak, at which time he was fifty years of age. By some means or other, a fellow, an emissary of a *rouge et noir* house in Bury Street, obtained an introduction to the whist-club; and one evening, as he and his dupe were leaving the house, he said, 'I am going out of curiosity to witness the game of *rouge et noir*, never having seen it. Will you go with me? We need not play.' In an ill-fated hour the tradesman assented, as he subsequently stated, prompted only by the same curiosity which his companion affected to be influenced by. When at the table, seeing others win, and perhaps impelled by his cupidity (for he was fond of money), he was induced to venture a few stakes, which came off in his favour; following up his success, he left the house that night a winner of L.80, and probably went home to sleep in peace, but it was the last he ever enjoyed! No man ever followed gaming with such avidity as he afterwards did; he attended morning and evening play, till poverty only stopped his going. At one period, it is said that he was a winner of L.2000: he repeatedly knocked up his intimate friends in the middle of the night to borrow money, after having lost that which he took to the table. In a few short months his funds began to wane, and his health to decline. He lingered not long, but departed from this world, a sad example of the danger of once commencing in such a vicious career."

BIOGRAPHIC SKETCHES.

NAPIER OF MERCHISTON.

JOHN NAPIER of Merchiston, a Scotsman, the distinguished inventor of the logarithms, an arithmetical process by which the labours of scientific men have been facilitated and advanced to an inconceivable degree, was born in the year 1550. He was descended from an ancient race of landed proprietors in Stirlingshire and Dumbartonshire. His father, Sir Alexander Napier of Edinbellie, in the former county, and Merchiston, in the county of Edinburgh, was master of the mint to James the Sixth, and survived the birth of the subject of this memoir for the unusual space of fifty-eight years. There is a prevalent notion that the inventor of the logarithms was a nobleman: this has arisen from his styling himself, in one of his title-pages, *Baro Merchistonii*; in reality, this implied *baron* in the sense of a superior of a barony, or what in England would be called lord of a manor. Napier was simply *Laird* of Merchiston—a class who in Scotland sat in parliament under the denomination of the *lesser barons*.

Napier was educated at St Salvador's College, in the University of St Andrew's, which he entered in 1562. He afterwards travelled on the Continent, probably to improve himself by intercourse with learned and scientific men. Nothing farther is ascertained respecting him, till after he had reached the fortieth year of his age. He is then found settled at the family seats of Merchiston, near Edinburgh, and Gartness, in Stirlingshire, where he seems to have practised the life of a recluse student, without the least desire to mingle actively in political affairs. That his mind was alive, however, to the civil and religious interests of his country, is proved by his publishing, in 1593, an exposition of the Revelations, in the dedication of which to the king, he urged his majesty, in very plain language, to attend better than he did to the enforcement of the laws, and the protection of religion, beginning reformation in his own "house, family, and court." From this it appears that Napier belonged to the strict order of Presbyterians in Scotland, for these are exactly the sentiments chiefly found prevalent among them at this period of our history.

In his more secluded residence at Gartness, Napier had both a waterfall and a mill in his immediate neighbourhood, which considerably interrupted his studies. He is said to have been a great deal more tolerant of the waterfall than of the mill; for while the one produced an incessant and equable sound, the other was attended with an irregular *clack-clack*, which marred the processes of his mind, and sometimes even rendered it necessary for him, when engaged in an unusually abstruse calculation, to desire the miller to stop work. He often walked abroad in the evening, in a long mantle, and attended by a large dog; and these circumstances, working upon minds totally unable to appreciate the real nature of his researches, raised a popular rumour of his being addicted to the black art. It is certain that, no more than other great men of his age, was he exempt from a belief in several sciences now fully proved to have been full of imposture. The practice of forming theories only from facts, however reasonable and unavoidable it may appear, was only enforced for the first time by a contemporary of Napier—the celebrated Bacon; and, as yet, the bounds between true and false knowledge were hardly known. Napier, therefore, practised an art which seems nearly akin to divination, as is proved by a contract entered into, in 1594, between him and Logan of Fastcastle—afterwards so celebrated for his supposed concern in the Gowry conspiracy. "Forasmuch," says this document, "as there were old reports and appearances that a sum of money was hid within Logan's house of Fastcastle, John Napier should do his utmost diligence to search and seek out, and by all craft and ingine [a phrase for mental power] to find out the same, or make it sure that no such thing has been there." For his reward he was to have the exact third of all that was found, and to be safely guarded by Logan back to Edinburgh with the same; and in case he should find nothing, after all trial and diligence taken, he was content to refer the satisfaction of his travels and pains to the discretion of Logan. What was the result of the attempt, or if the attempt itself was ever made, has not been ascertained.

Besides dabbling in sciences which had no foundation in nature, Napier addicted himself to certain speculations which have always been considered as just hovering between the possible and the impossible, a number of which he disclosed in 1596 to Anthony Bacon, the brother of the more celebrated philosopher of that name. One of these schemes was for a burning mirror similar to that of Archimedes, for setting fire to ships; another was for a mirror to produce the same effects by a material fire; a third for an engine which should send forth such quantities of shot in all directions as to clear every thing in its neighbourhood; and so forth. In fact, Napier's seems to have been one of those active and excursive minds, which are sometimes found to spend a whole life in projects and speculations without producing a single article of real utility, and in other instances hit upon one or two things, perhaps, of the highest order of usefulness. It has been arranged for the good of mankind, that the most follow beaten tracks in all things, while a very few are constantly trying new expedients, constantly roaming about for improved ways of accomplishing labour. Thus, a certain degree of general good is never lost sight of, while the possibility of increasing it receives just that degree of attention on the whole, which may be sufficient for its discovery, without perilling too much of what is already ascertained, in the search. As the life of Napier advanced, he seems to have gradually forsaken wild and hopeless projects, and applied himself more and more to the pure sciences. In 1598, he is found suggesting the use of salt in improving land; an idea probably passed over in his own time as chimerical, but revived in our own day with good effect. No more is heard of him till, in 1614, he astonished the world by the publication of his book of logarithms. He is understood to have devoted the intermediate time to the study of astronomy, a science then reviving to a new life under the auspices of Kepler and Galileo.

"The demonstrations, problems, and calculations of this science, most commonly involve some one or more of the cases of trigonometry, or that branch of the mathematics, which, from certain parts, whether sides or angles, of a triangle being given, teaches how to find the others which are unknown. On this account, trigonometry, both plane and spherical, engaged much of Napier's thoughts; and he spent a great deal of his time in endeavouring to contrive some methods by which the operations in both might be facilitated. Now, these operations, the reader, who may be ignorant of mathematics, will observe, always proceed by geometrical ratios, or proportions. Thus, if certain lines be described in or about a triangle, one of these lines will bear the same geometrical proportion to another, as a certain side of the triangle does to a certain other side. Of the four particulars thus arranged, three must be known, and then the fourth will be found by multiplying together certain two of those known, and dividing the product by the other. This rule is derived from the very nature of geometrical proportion, but it is not necessary that we should stop to demonstrate here how it is deduced. It will be perceived, however, that it must give occasion, in solving the problems of trigonometry to a great deal of multiplying and dividing—operations which, as every body knows, become very tedious whenever the numbers concerned are large; and they are generally so in astronomical calculations. Hence such calculations used to exact immense time and labour, and it became most important to discover, if possible, a way of shortening them. Napier, as we have said, applied himself assiduously to this object; and he was, probably, not the only person of that age whose attention it occupied. He was, however, undoubtedly the first who succeeded in it, which he did most completely by the admirable contrivance which we are now about to explain.

When we say that 1 bears a certain proportion, ratio, or relation to 2, we may mean any one of two things; either that 1 is the half of 2, or that it is less than 2 by 1. If the former be what we mean, we may say that the relation in question is the same as that of 2 to 4, or of 4 to 8; if the latter, we may say that it is the same as that of 2 to 3, or of 3 to 4. Now, in the former case, we should be exemplifying what is called a *geometrical*, in the latter, what is called an *arithmetical* proportion: the former being that which regards the number of times, or parts of times, the one quantity is contained in the other; the latter regarding only the difference between the two quantities. We have already stated that the property of four quantities, arranged in geometrical proportion, is, that the *product* of the second and third, *divided* by the first, gives the fourth. But when four quantities are in arithmetical proportion, the *sum* of the second and third, diminished by the *subtraction* of the first, gives the fourth. Thus, in the geometrical proportion, 1 is to 2 as 2 is to 4; if 2 be multiplied by 2 it gives 4; which divided by 1 still remains 4; while

in the arithmetical proportion, 1 is to 2 as 2 is to 3; if 2 be added to 2 it gives 4; from which if 1 be subtracted, there remains the fourth term 3. It is plain, therefore, that, especially where large numbers are concerned, operations by arithmetical must be much more easily performed than operations by geometrical proportion; for, in the one case you have only to add and subtract, while in the other you have to go through the greatly more laborious processes of multiplication and division.

Now, it occurred to Napier, reflecting upon this important distinction, that a method of abbreviating the calculation of a *geometrical* proportion might perhaps be found, by substituting, upon certain fixed principles, for its known terms, others in *arithmetical* proportion, and then finding, in the quantity which should result from the addition and subtraction of these last, an indication of that which should have resulted from the multiplication and division of the original figures. It had been remarked before this, by more than one writer, that if the series of numbers 1, 2, 4, 8, &c. that proceed in geometrical progression, that is, by a continuation of geometrical ratios, were placed under or alongside of the series 0, 1, 2, 3, &c. which are in arithmetical progression, the addition of any two terms of the latter series would give a sum, which would stand opposite to a number in the former series indicating the product of the two terms in that series, which corresponded in place to the two in the arithmetical series first taken. Thus, in the two lines,

1,	2,	4,	8,	16,	32,	64,	128,	256,
0,	1,	2,	3,	4,	5,	6,	7,	8,

the first of which consists of numbers in geometrical, and the second of numbers in arithmetical progression, if any two terms, such as 2 and 4, be taken from the latter, their sum 6, in the same line, will stand opposite to 64 in the other, which is the product of 4 multiplied by 16, the two terms of the geometrical series which stand opposite to the 2 and 4 of the arithmetical. It is also true, and follows directly from this, that if any three terms, as, for instance, 2, 4, 6, be taken in the arithmetical series, the sum of the second and third, diminished by the subtraction of the first, which makes 8, will stand opposite to a number (256) in the geometrical series which is equal to the product of 16 and 64 (the opposites of 4 and 6), divided by 4 (the opposite of 2).

Here, then, is, to a certain extent, exactly such an arrangement or table as Napier wanted. Having any geometrical proportion to calculate, the known terms of which were to be found in the first line or its continuation, he could substitute for them at once, by reference to such a table, the terms of an arithmetical proportion, which, wrought in the usual simple manner, would give him a result that would point out or indicate the unknown term of the geometrical proportion. But, unfortunately, there were many numbers which did not occur in the upper line at all, as it here appears. Thus, there were not to be found in it either 3, or 5, or 6, or 7, or 9, or 10, or any other numbers, indeed, except the few that happen to result from the multiplication of any of its terms by two. Between 128 and 256, for example, there were 127 numbers wanting, and between 256 and the next term (512) there would be 255 not to be found.

We cannot here attempt to explain the methods by which Napier's ingenuity succeeded in filling up these chasms, but must refer the reader, for full information upon this subject, to the professedly scientific works which treat of the history and construction of logarithms. Suffice it to say, that he devised a mode by which he could calculate the proper number to be placed in the table over against any number whatever, whether integral or fractional. The new numerical expressions thus found, he called *Logarithms*, a term of Greek etymology, which signifies the ratios or proportions of numbers. He afterwards fixed upon the progression, 1, 10, 100, 1000, &c., or that which results from continued multiplication by 10, and which is the same according to which the present tables are constructed. This improvement, which possesses many advantages, had suggested itself about the same time to the learned Henry Briggs, then professor of geometry in Gresham College, one of the persons who had the merit of first appreciating the value of Napier's invention, and who certainly did more than any other to spread the knowledge of it, and also to contribute to its perfection."*

The invention was very soon known over all Europe, and was every where hailed with admiration by men of science. Napier followed it up, in 1617, by publishing a small treatise, giving an account of a method of performing the operations of multiplication and division, by means of a number of small rods. His materials for calculation have maintained their place in science, and are known by the appellation of Napier's Bones. In the same year, April 3, this illustrious man breathed his last, at Merchiston Castle [a small old tower still existing in the neighbourhood of Edinburgh], and was buried in the church of St Giles, on the eastern side of its southern entrance, where a stone tablet, bearing a Latin inscription, indicated that this is the burial-place of the Napiers. His family has since been ennobled, and the present Lord Napier is distinguished as an excellent landlord, and a zealous promoter of the improvement of the moral and physical condition of the peasantry. A life of the ingenious Laird of Merchiston was published in 1787, by the Earl of Buchan; but one, which it is to be hoped will prove more worthy of the subject, is in preparation by Mr Mark Napier, advocate.

HUMAN LIFE.

[BY BERNARD BARTON, ESQ.]

I walk'd the fields at morning's prime,
The grass was ripe for mowing;
The sky-lark sang his matin chime,
And all was brightly glowing.

"And thus," I cried, "the ardent boy
His pulse with rapture beating,
Deems Life's inheritance is joy—
The future proudly greeting."

I wander'd forth at noon:—alas!
On earth's maternal bosom
The scythe had left the withering grass
And stretch'd the fading blossom

And thus, I thought with many a sigh,
The hopes we fondly cherish,
Like flowers which blossom but to die,
Seem only born to perish.

Once more, at eve, abroad I stray'd,
Through lonely hay-fields musing;
While every breeze that round me play'd
Rich fragrance was diffusing.

The perfumed air, the hush of eve,
To purer hopes appealing,
O'er thoughts perchance too prone to grieve,
Scatter'd the balm of healing.

For thus "the actions of the just,"
When Memory hath enshrined them,
E'en from the dark and silent dust
Their odour leave behind them.

—*Forget Me Not*, 1827.

INDIAN ANTIQUITIES OF NORTH AMERICA.

THE whole of English North America, when first discovered and colonised by Europeans, was occupied by tribes who were utterly uncivilised; that is, they had no knowledge of any of the arts of life, except of such as ministered in the rudest manner to their immediate necessities. The greater part of them were hunters, and had no settled dwelling-place; roaming over a vast extent of country, and only stopping for a time in spots where they found the game most plentiful; or when they were occupied in hostile expeditions against other tribes, against whom they entertained some project of revenge. There were a few settled villages on rivers, or by the sea-coast, where the inhabitants lived by fishing. But their dwellings every where were built only of clay, reeds, and branches of trees; their implements for hunting and fishing were nothing but lances and coarse hooks formed of shells, or perhaps of copper; and their dress a scanty wrapper made of the bark of trees. Such being the condition of the people, they were incapable of producing any work which either required skill in the design, or the union of a number of hands for executing it. No such work was seen among them: their largest building was the hall of the *sachem*, or elder of the village, which was in every respect inferior to the barns of turf and stone seen in the Highlands, and was not fitted to last above eight or ten seasons. How great, then, was the surprise of the civilised people, on proceeding farther into the wilderness, and approaching the forests of the Mississippi, to find among these solitudes the remains of works which could only have been designed and executed by people considerably advanced in civilization, and living under the regulation of a government which had the power of employing the labour of thousands of workmen. The existing tribes had not the slightest tradition about these monuments, or of the people by whom they had been constructed, which is the more singular, that almost all countries have some ancient race embodied in their traditionary stories, whom they are accustomed to consider as the engineers of every antique monument for whose existence they cannot otherwise account. The Scots have their *Pechs*; the Greeks and Italians had the *Cyclops*, who were said to have built the gigantic ruins of Mycenæ, Tiryus, Roselle, Norba, &c. The Hindoos and Persians have Deotas and Jins, to whom they give the credit of such works; and so it is universally in other countries. The North American tribes, however, seem to have fallen into so low a state, that they had neither curiosity nor interest in the singular remains of antiquity which are found in their wilds: it is probable that they did not even distinguish them as works of art—an idea which would have implied some knowledge that art and science existed superior to their own, but that they considered them merely as some freak of nature. How, then, can we account for the existence of such monuments in a country where they are completely overlooked, and where the inhabitants have fallen into such a state of savageism? This is one of the most curious questions relating to the early state of America, and has never yet received a satisfactory solution.

The following notices concerning some of the most interesting of these ancient works, are copied chiefly from Warden's excellent Account of the United States. The whole of them, it will be observed, occur in the western states, in the regions of the Ohio, Mississippi, and Missouri.

"A singular circumstance," says Mr Warden, in the history of Kentucky, is the existence of mounds and fortifications, which indicate great antiquity, and a considerable acquaintance with the mechanical arts in some race of former inhabitants. Several of the old forts near the mouth of Kentucky river are covered with trees, which the botanist Dr Cutler considered as of second growth; and inferred from this that the fortifications must be more than one thousand years old. The remains of one, situated half a mile from the Ohio, and nearly opposite the mouth of the Big Scioto River, enclose fourteen acres of a square form. The walls are thirty feet thick at the base, and, on the summit, large enough for the passage of a waggon; they are from eight to sixteen feet in height. There are seven gateways, each twenty feet high; three on the west, two on the east, and two on the north. From the north-west angle are seen the remains of a *covered way* (a road with a wall on each side as a shelter from marksmen), which extends 280 yards to a stream on the west side of the fort. The walls are of the same dimensions as those of the fort; and there is a road protected in the same way leading to a creek (stream) on the east side, distant 150 yards. Beyond these streams on the east and west side there is no vestige of defence. At a small distance from the fort there are two mounds (like watch-towers) of a pyramidal form." On French Broad River, in Tennessee, are perpendicular rocks, on which, more than 100 feet above the water, are carvings of birds and beasts, &c.

In Indiana, on the north side of the Ohio, remains of a different kind are found. These are a number of mounds lying in the tract from White River to the sources of the Wabash. They are of unequal size, and have been evidently formed at very remote periods from each other; they generally contain bones, those of the smaller mounds being still undecayed, and able to bear their own weight, while those of the larger are so decomposed that they crumble to dust on the smallest touch. The trees which grow upon the smaller are also evidently of less age than many of those in the neighbouring woods, while those on the higher mounds are old and magnificent trees. This state of things seems to indicate a progressive decay of arts and power, during a long period, among the people by whom the mounds were raised.

In the state of Ohio, ancient fortifications are numerous. At Cincinnati there is a circular wall or embankment 800 feet across; the bank is thirty feet thick at the base, and from three to six high; there are several others of smaller dimensions, besides four mounds, one of which is twenty-seven feet high, and 440 across. On the summit of an elevated hill, two miles below Hamilton, the walls of an ancient fortification enclose eighty acres of ground. In Highland County, two miles west of Chillicotte, there is a wall of stone from twelve to fifteen feet high, and four or five thick, which encloses upwards of 100 acres. Near Piqua, in Miami County, there is one which encloses about seventeen acres, in a circular form; the walls all round are built of stone, carried from the river 600 yards distant. A wall from four to seven feet high extends seven miles from the Great to the Little Scioto River. The trees growing on the walls of these ruins are all as large as any in the surrounding forests, and cannot be less than 400 years old. There are remains of the same kind all the way from Ohio, south and south-west, to the Floridas.

They are found also in Michigan to the north. On the river Huron, in that district, is a fortress with walls of earth, quite the same as those of Ohio and Kentucky; another is seen three miles and a quarter below Detroit, enclosing several acres, in the midst of an extensive marsh, with a breastwork three or four feet high. On the west of Lake Michigan is found perhaps the most singular of these curious relics; it stands on a level plain below Lake Pepin; it is covered with grass; but Carver, the traveller who describes it, mentions that he could plainly trace a breastwork of a circular form, with its flanks reaching to the river, which covered its rear; the ruin was about four feet high, extending nearly a mile, and capable of protecting 5000 men. The outline of the work had been traced in angles for the facility of defence, quite on the same principle as those of modern fortifications.

In Missouri, in the country of the Sioux Indians, there are many mounds and fortifications. they are also found on the Osage and Platte rivers. So far Mr Warden. Besides the indications given by these monuments, there are other proofs that the continent of North America has been at some former period occupied by a people considerably advanced in a knowledge of the arts. In the gold mines which are now wrought in the western parts of Carolina and Georgia, there have been found crucibles of excellent workmanship, and which were preferred by the miners to the best which can be purchased at the present day. Unluckily none of them have been preserved, but the evidence which they afforded, that these mines have been wrought during some very remote period, and by a people not at all deficient in a knowledge of the arts, is full and unquestionable.

All these appearances are of course utterly unintelligible to the present tribes of Indians; and being accompanied by nothing in the shape of letters, hiero-

glyphics, or other marks, in which literary diligence might have traced some thread of discovery, they are equally obscure to the learned.

The history of the western continent does not, however, leave us altogether without some facts which throw a glimmer of light on these singular remains, and the people to whom they belonged.

The Mexicans, who inhabited the narrow neck of mountain land which joins the two continents of North and South America, were, when first discovered by the Spaniards, in a state of civilization approaching to that of some European nations. The body of the people were, indeed, in a state of darkness and savageism little superior to that of the tribes by whom they were surrounded; but there was an educated and informed class among them, to whom this mass of ignorance was content to be subject. The educated portion was distributed among the uneducated, in such a manner that the benefits of their knowledge could be every where felt, and gave them influence. Works of great extent and ingenuity were executed by the conjoined skill and labour which could by these two classes be brought to bear on them. It is known, however, from the traditions of this people, and from certain hieroglyphical documents which they had preserved relating to their own history, that Mexico was not the place in which their tribe was originally situated. They had migrated, according to their own account, from regions far to the northward, and had once been a large and powerful nation, whose strength and numbers were reduced almost to nothing, in various desertions, changes, and hostile attacks, during their long migration from their original seat, called Aztlan. The imperfect records which they have preserved, intimate obscurely the time occupied in this period of wandering, as well as the stages at which they halted on their way. Some of these latter have been traced; and by the remains found on the spot, combined with the indications of Mexican hieroglyphics, there is reason to think that they can still be identified. The ruins of a great city were discovered in 1773, near the head of the Gulf of California, and corresponding with one of the stations. They were situated in the midst of a vast and beautiful plain, and occupied a space of three square leagues. The Spaniards gave them the name of *Las Casas Grandes*, or the "Magnificent Buildings;" and the whole plain is filled with fragments of stoneware, resembling the Mexican, beautifully painted in red, white, and blue. It is remarkable also, that, to the north of this region, in a district never occupied, and hardly ever seen by Europeans, the native Indians have advanced considerably in civilization. A missionary, who visited the Mocquis in 1773, was astonished to find here an Indian town, with two large squares, houses of several stories, streets well laid out, and parallel to each other. The people assemble at evening on the terraced roofs of their houses; and the region every where presents traces of cultivation, resembling that of the ancient Mexicans. These people speak a language quite different from the Mexican; but it is well known to some of the learned of America, that two parts of the same tribe, removed from each other, and placed under different circumstances, with different pursuits and a different aspect of country, will in time so completely change, each from the common language, that their origin can no longer be traced by that means. Still farther north, there are found people who indulge a taste for some of the peculiar arts of the same nation, without having preserved any thing of their domestic refinement. Between Nootka Sound and Cook's River, under the 57th degree of N. lat., the natives have a strong predilection for hieroglyphical paintings, such as were found among the Mexicans; and they execute carvings in wood, imitations of the human features and of animals, with great spirit and fidelity. Their buildings of wood showed also design, and the efforts of combined labour.

As we follow these traces of Mexican civilization, we are led, it will be observed, towards the northern part of the American continent, where the ancient remains which first excited our wonder are situated. These are more frequent towards the western districts, and vanish altogether on approaching the Atlantic; that is, their numbers increase as they approach the line of ancient Mexican civilization, and disappear as they leave it. The connection which this circumstance points out between the mysterious monuments of the Ohio, Mississippi, and Missouri, and the *historical civilization* of the races of the south and west, cannot be overlooked. The chain of connection is at present broken and feeble, but investigation may supply the deficient links, and introduce certainty, where as yet there are only probability and surmises.

The Mexicans consisted, as we have said, of a small educated class (not, however, apparently selected from any particular tribe), and a large body of ignorant and demi-savage people, who were under the former, and submitted themselves to be directed by their superior information. This was the kind of civilization which existed in most of the nations of antiquity, no means being then known for the *general* diffusion of knowledge. It is, however, the most insecure and precarious state in the progress of nations, because, unless with a very strong and well-organised military force, the uninformed mass are always liable to be worked on by some passion or prejudice, and may thus at any time rise and sweep into destruction the whole labours of the better informed and ruling body. Knowledge is very apt to retrograde in such a state, and has indeed done it in various instances; and it is from such a cause that we must trace the destruction of that power and skill which erected the works of which we have been speaking. There is no occasion for supposing that any nation ever existed in North America different from those found there. It appears only that civilization had at one time gained an ascendancy, which, surrounded and mixed as it was with the hostile power of barbarism and ignorance, it was not able to maintain. The connection of this comparative state of improvement with that of the Mexicans, who seem to have been driven from the northern to the southern parts of the same country, may be elucidated by future investigation.

SCIENCE AND LABOUR.

INDIVIDUALS whose occupations are chiefly of a laborious and physical nature, are exceedingly apt to draw invidious comparisons betwixt the value of their own efforts, and that of those classes of men who mainly depend for their subsistence on the exercise of their mental faculties. To do so, however, is quite adverse to the principles developed by political economists, and is, in reality, quite unworthy of any man laying claim to the most common understanding. It is only by the extraordinary combinations of science with genius and capital, that the working man is furnished with employment, or enabled to support his family; and without a body of men in the country, whose labour consists simply of *thinking*, society would fall in pieces, and poverty visit the firesides of the artizan and peasant. This proper view of the value of science and mental labour is well advanced in the small work called the "Rights of Industry," forming a volume of the "Working Man's Companion."

"Lord Bacon, the great master of practical wisdom, has said that 'the effort to extend the dominion of man over nature is the most healthy and most noble of all ambitions.' 'The empire of man,' he adds, 'over material things, has for its only foundation the sciences and the arts.' A great deal of the knowledge which constitutes this dominion has been the property of society, handed down from the earliest ages. The indirect influence of a general advance in knowledge upon the particular advance of any branch of labour, is undeniable; for the inquiring spirit of an age spreads itself on all sides, and improvement is carried into the most obscure recesses, the darkest chinks and corners of a nation, even as the Liverpool railway is daily extending the civilization of the rudest districts of Ireland. It has been wisely and beautifully said by Hume, 'We cannot reasonably expect that a piece of woollen cloth will be wrought to perfection in a nation which is ignorant of astronomy, or where ethics are neglected.' The positive influence of science in the direction of labour is exhibited in the operations of mechanics and chemistry applied to the arts, in the shape of machines for saving materials and labour, and of processes for attaining the same economy. These are the influences of science upon labour, not so direct as the mechanical skill which has contrived the steam-engine, or so indirect as the operation of ethics upon the manufacture of a piece of woollen cloth; but which confer a certain, and in some instances enormous benefit upon production, by the operation of causes which, upon a superficial view, appear to be only matters of laborious but unprofitable speculation. If we succeed in satisfying your minds as to the extent and importance of those aids which production derives from the labours of men who have not been ordinarily classed amongst 'working men,' but who have been truly the hardest and most profitable workers which society has ever possessed, we shall show you what an intimate union subsists amongst those classes of society who appear the most separated; and that these men really labour with you all most effectually in the advancement of the great interests of mankind.

When Hume thought that a nation that had not studied astronomy would be behind in the manufacture of cloth, he perhaps did not mean to go the length of saying that the study of astronomy has a real influence in making cloth cheaper, in lessening the cost of production, and in therefore increasing the number of consumers. But look at the direct influence of astronomy upon navigation. A seaman, by the guidance of principles laid down by the great minds that have directed their mathematical powers to the study of astronomy—such minds as those of Newton and La Place—measures the moon's apparent distance from a particular star. He turns to a page in the Nautical Almanac, and, by a calculation, directed principally by this table, can determine whereabouts he is upon the broad ocean, although he may not have seen land for three months. Sir W. Herschel, a mathematician of our own times, who has united to the greatest scientific reputation the rare desire to make the vast possessions of the world of science accessible to all, has given, in his 'Discourse on the Study of Natural Philosophy,' an instance of the accuracy of such lunar observations, in an account of a voyage of eight thousand miles, by Captain Basil Hall, who, without a single landmark during eighty-nine days, ran his ship into the harbour of Rio as accurately, and with as little deviation, as a coachman drives his stage into an inn-yard. But what has this, you say, to do with the price of clothing? Exactly this: part of the price arises from the cost of transport. If there were no 'lunar distances' in the Nautical Almanac, the voyage from New York to Liverpool might require three months instead of three weeks.

Astronomy, therefore, you see, and navigation, both sciences the results of long ages of patient inquiry, have opened a communication between the uttermost ends of the earth, and therefore have had a slow but certain effect upon the production of wealth, and the consequent diffusion of all the necessaries, comforts, and conveniences of civilised life. The connection between manufactures and science, practical commerce and abstract speculation, is so intimate, that it might be traced in a thousand striking instances. A map now appears a common thing, but it is impossible to overrate the extent of the accumulated observations that go to make up a map. An almanac seems a common thing, but it is impossible to overrate the prodigious accumulations of science that go to make up an almanac. With these accumulations, it is now no very difficult matter to construct a map or an almanac. But if society could be deprived of the accumulations, and we had to re-create and remodel every thing for the formation of our map and our almanac, it would perhaps require many centuries before these accumulations could be built up again; and all the arts of life would go backward, for want of the guidance of the principles of which the map and the almanac are the interpreters for popular use.

Science, we see, connects distant regions, and renders the world one great commercial market. Science is, therefore, a chief instrument in the production of commercial wealth. But we have a world beneath our feet which science has only just now begun to explore. We want fuel and metallic ore to be raised from the bowels of the earth; and, till within a very few years, we used to dig at random when we desired to dig a mine, or confided the outlay of thousands of pounds to be used in digging, to some quack whose pretensions to knowledge were even more deceptive than a reliance upon chance. The science of geology, almost within the last quarter of a century, has been able, upon certain principles, to determine where coal especially can be found, by knowing in what strata of earth coal is necessarily formed; and thus the expense of digging through earth to search for coal, when science would at once pronounce that no coal was there, has been altogether withdrawn from the amount of capital to be expended in the raising of coal. That this saving has not been small, we may know from the fact, that eighty thousand pounds were expended fruitlessly in digging for coal at Bexhill, in Sussex, not many years ago, which expense geology would have instantly prevented; and have thus accumulated capital, and given a profitable stimulus to labour, by saving their waste.

Whatever diminishes the risk to life or health, in any mechanical operation, or any exertion of bodily labour, lessens the cost of production, by diminishing the premium which is charged by the producers to cover the risk. The lightning conductor of Franklin, which is used very generally on the Continent, and almost universally in shipping, diminishes the risk of property, in the same way that the safety-lamp diminishes the risk of life; and, by this diminution, the rate of insurance is lessened, and the cost of production therefore lessened. Lightning is one of the destructive forces of Nature, in particular cases, which science knows how to control. A few years ago, all the timber in the Hartz Forest in Germany was destroyed by a species of beetle, which, gnawing completely round the bark, prevented the sap from rising. This destructive animal made its appearance in England; and science very soon discovered the cause of the evil, and provided for its removal. If there had been no knowledge of natural history here, not a tree would have been left in our woods; and what, then, would have been the cost of timber?

The crossing and intertwining of the abstract and practical sciences, the mechanic skill and the manual labour, which are so striking in the manufacture of a piece of calico, prevail throughout every department of industry in a highly-civilised community. Every one who labours at all profitably, labours for the production of utility, and sets in motion the labour of others. Look at the labour of the medical profession. In the fourteenth century, John de Gaddesden treated a son of Edward the Second for the small-pox, by wrapping him up in scarlet cloth, and hanging scarlet curtains round his bed; and, as a remedy for epilepsy, the same physician carried his patients to church to hear mass! The medical art was so little understood in those days, that the professors of medicine had made no impression upon the understanding of the people; and they consequently trusted not to medicine, but to vain charms, which superstitions the ignorance of the practitioners themselves kept alive. Francis the First, king of France, having a persuasion that because the Jews were the most skilful physicians of that day, the virtue was in the Jew, and not in the science which he professed, sent to Charles the Fifth of Spain for a Jewish physician; but finding that the man who arrived had been converted to Christianity, he refused to employ him, thinking the virtue of healing had therefore departed from him. When such ignorance prevailed, diseases of the

slightest kind must have been very often fatal; and the power of all men to labour profitably must have been greatly diminished by the ravages of sickness. These ravages are now checked by medical science and medical labour. In some parts of France, even at the present day, the sick cattle are taken by the country people outside the churches to hear mass. If there were a skilful cattle-doctor in those villages, the loss of stock would be doubtless lessened, and the people would be all the richer for the cattle-doctor's art, instead of degrading religion by an homage akin to the worst idolatry.

But the principle of connecting every exertion of the mind with profitable labour goes farther even than the applications of science, direct or indirect, to the mechanical arts. The sciences and arts cannot be carried forward except in a country where the laws are respected, where justice is upheld, where intellect generally is cultivated, and where taste is diffused. The instructor of the young, who dedicates his time to advancing the formation of right principles, and the acquirement of sound knowledge by his pupils, is a profitable labourer. The writer who applies his understanding to the discovery and dissemination of moral and political truth, is a profitable labourer. The interpreter and administrator of the laws, who upholds the reign of order and security, defending the innocent, punishing the guilty, and vindicating the rights of all from outrage and oppression, is a profitable labourer. These labourers, it may be said, are still direct producers of utility, but that those who address themselves to the imagination—the poets, the novelists, the painters, and the musicians—in every polished society, are unprofitable labourers. One word is sufficient for an answer. These men advance the general intellect of a country, and they therefore indirectly advance the production of articles of necessity. We have already shown you how the study of the higher mathematics, upon which astronomy is founded, has an influence upon the production of a piece of woollen cloth; and we beg you to bear this connection in mind when you hear it said, as you sometimes may, that an abstract student, or an elegant writer, is not a producer—is, in fact, an idler. The most illustrious writers of every country, the great poets, have lifted mankind to their noblest pursuits of knowledge and virtue. Even the less dignified labourers in the same field—those who especially devote themselves to give pleasure and amusement—call into action some of the highest and purest sources of enjoyment. They lead the mind to seek its recreations in more ennobling pursuits than those of sensuality; their arts connect themselves by a thousand associations with all that is beautiful in the natural world; they are as useful for the promotion of pure and innocent delight, as the flowers that gladden us by their beauty and fragrance by the side of the corn that nourishes us. An entire community of poets and artists would be as unprofitable as if an entire country were dedicated to the cultivation of violets and roses; but the poets and the artists may, as the roses and the violets, furnish the graces and ornaments of life, without injury, and indeed with positive benefit, to the classes who more especially dedicate themselves to what is somewhat exclusively called the production of utility. The right direction of the talents which are dedicated to art and literature is all that is required from those who address themselves to these pursuits. He, therefore, who beguiles a vacant hour of its tediousness, by some effort of intellect which captivates the imagination without poisoning the morals—and he who by the exercise of his art produces forms of beauty which awaken in the mind that principle of taste which, more than any other faculty, requires cultivation—have each bestowed benefits upon the world which may be accurately enough measured even by the severe limitations of political economy; they are profitable labourers, and benefactors of their species.

We have entered into these details, principally to show that there are other and higher producers in society than the mere manual labourers. It was an ignorant fashion amongst the mental labourers of other days to despise your class, the physical labourers. They have learnt to know your value, and you should learn to know theirs. Both classes are working-classes. No one can say that the mental labourers are not workers. They are, we may truly affirm, taken as a class, the hardest workers in the community. No one ever reached eminence in these pursuits without unwearied industry: the most eminent have been universally despisers of ease and sloth, and have felt their highest pleasures in the absorbing devotion of their entire minds to the duties of their high calling. They have wooed Knowledge as a mistress that could not be won without years of unwearied assiduity. The most eminent, too, have been practical men, despising no inquiry, however trifling it might appear to common eyes, and shrinking from no occupation, however tedious, as long as it was connected with their higher duties. The *positive* influence even of the labours of the poets and the artists upon the advance of other labour might be easily shown. In their productions, especially, supply goes before demand, and creates demand. It has been calculated by an American writer, that the number of workmen who have been set in action—paper-makers, printers, binders—by the writings of Sir Walter Scott alone, in all countries, would, if gathered together, form a community that would fill a large town. The potteries of Etruria, in Staffordshire, could not have existed unless Mr Wedgwood had introduced into our manufacture of china the forms of Grecian art, bequeathed to us by the taste of two thousand years ago, and thus created a demand which has furnished profitable labour to thousands. But this, as we have already shown you, is not the principal way of viewing the influence of science, and literature, and art, upon all other industry. To reduce every labour in art, or literature, or science, to the same standard of value by which manual labour is measured, would be as absurd as the tasteless ignorance of the Spaniards, who applied a rare and valuable antique bust to serve as the weight to a church-clock. Any attempt to put the mental labourers upon the same footing of value as the labourers without skill, would be as impossible as it would be mischievous if it were possible; for in that case production would decline, and ultimately cease altogether, for the fountains of labour with skill would be dried up. Capital must go forward working with accumulation of knowledge; and fortunately, if you, the working-men, adapt yourselves to this natural energy of capital, you will yourselves become the accumulators of knowledge. Manual labour is only in the highest degree required in the early settlement of a country. When a dense population succeeds to a scattered one, labour with skill is called into action. Your counter-control to the absorbing power of capital is the equally absorbing power of skill—for that also is capital. Knowledge is power, because knowledge is property."

A LETTER FROM A SETTLER FOR LIFE IN VAN DIEMAN'S LAND.

(From Hood's Comic Annual, 1833.)

"*To Mary at No* 45 *Mount Street Grosvenor Square.*

Dear Mary—Littel did I Think wen I advertisd in the Tims for annother Plaice of taking wan in Vandemin's land. But so it his and hear I am amung Kangerooses and Savidges and other Forriners. But goverment offering to Yung Wimmin to Find them in Vittles and Drink and Close and Husbands was turms not be sneazed at, so I rit to the Outlandish Seckertary and he was so Kind as Grant.

Wen this cums to Hand go to Number 22 Pimpernel Plaice And mind and go betwixt Six and sevin For your own Sake cos then the fammilys Having Diner give my kind love to betty Housmad and Say I am safe of my Jurney to Forrin parts And I hope master as never Mist the wine and brought Them into trubble on My accounts. But I did not Like to leav for Ever And Ever without treeting my Frends and feller servents and Drinking to all their fairwells. In my Flury wen the Bell rung I forgot to take My own Key out of missis Tekaddy but I hope sum wan had the thought And it is in Good hands but shall Be obleeged to no. Lickwise thro my Loness of Sperrits my lox of Hares quite went out of My Hed as was prommist to Be giv to Gorge and Willum and the too Futmen at the too Next dores But I hop and Trust betty pacifid them with lox of Her hone as I begd to Be dun wen I rit Her from dover. O Mary wen I furst see the dover Wite clifts out of site wat with squemishnes and Felings I all most repentid givin Ingland warning And had douts if I was goin to better my self. But the stewerd was verry kind tho I could make Him no returns xcept by Dustin the ship for Him And helpin to wash up his dishes. Their was 50 moor Young Wimmin of us and By way of passing tim We agread to tell our Histris of our selves taken by Turns But they all turnd out Alick we had All left on acount of Testacious masters and crustacious Mississis and becos the Wurks was to much For our Strenths but betwixt yew and Me the reel truths was beeing Flirted with and unprommist by Perfidus yung men. With sich exampils befour there Minds I wunder sum of them was unprudent enuff to Lissen to the Salers whom are coverd with Pitch but famus for Not stiking to there Wurds. has for Me the Mate chose to be verry Partickler wan nite Setting on a Skane of Rops but I giv Him is Anser and lucky I did for Am infourmd he as Got too more Marred Wives in a state of Biggamy thank Goodness wan can marry in new Wurlds without mates. Since I have bean in My pressent Sitiation I have had between too and three offers for My Hands and expex them Evry day to go to fistcufs about Me this is sum thing lick treeting Wimmin as Wimmin ought to be treetid Nun of your sarsy Buchers and Backers as brakes there Prommissis the sam as Pi Crust wen its maid Lite and shivvry And then laffs in Your face and say they can hav anny Gal they lick round the Square. I dont menshun nams but Eddard as drives the Fancy bred will no Wat I mean. As soon as ever the Botes rode to Land I dont agrivate the Truth to say their was haf a duzzin Bows apeace to Hand us out to shoar and sum go so Far as say they was offered to thro Specking Trumpits afore they left the Shipside. Be that as it May or may Not I am tould We maid a Verry pritty site all Wauking too and too in our bridle wite Gownds with the Union Jacks afore Us to pay humbel Respex to kernel Arther who behaived verry Gentlemanny and Complementid us on our Hansom apearences and Purlitely sed he Wisht us All in the United States. the Salers was so gallaunt as giv three chears wen We left there Ship and sed if so be they had not Bean without Canons they Wood have salutid us all Round. Servents mite live Long enuff in Lonnon without Being sich persons of Distinkshun. For my hone Part, cumming amung strangers and Pig in Pokes, prudence Dicktatid not to be askt out At the verry furst cumming in howsumever All is setteld And the match is aproved off by Kernel Arther and the Brightish goverment, who as agread to giv me away. thems wat I call Honners as we used to Say at wist. Wan thing in My favers was my voice and my noing the song of the Plane Gould Ring witch the Van Demons had never Herd afore I wood recummend all as meens cumming to Bring as menny of the fashingable Songs and Ballets as they Can—and to get sum nolliges of music as fortnately for me I was Abel to by meens of praxtising on Missis Piney Forty wen the fammily Was at ramsgit. of Coarse you and betty Will xpect Me to indulge in Pearsonallitis about my intendid to tell Yew wat he is lick he is Not at All lick Eddard as driv the Fancy bred and Noboddy else yew No. I wood send yew His picter Dun by himself only its no more lick Him then Chork is to Cheas. In spit of the Short Tim for Luv to take Roots I am convinst he is verry Passionet of course As to his temper I cant Speek As yet as I hav not Tride it. O mary littel did I think too Munth ago of sending yew Brid Cake and Weddin favers wen I say this I am only Figgering in speach for Yew must Not look for sich Things from this Part of the Wurld I dont mean this by Way of discurridgement Wat I meen to Say is this If so be Yung Wimmin prefers a state of Silly Bessy they Had better remane ware they was Born but as far as Reel down rite Coarting and no nonsens is concarnd This is the Plaice for my Munny a Gal has only to cum out hear And theirs duzzens will jump at her like Cox at Gusberris. it will Be a reel kindnes to say as Much to Hannah at 48 and Hester Brown and Peggy Oldfield and partickler poor Charlotte they needent Fear about being Plane for Yew may tell Them in this land Faces dont make stumblin Blox and if the Hole cargo was as uggly As sin Lots wood git marrid. Deer Mary if so Be you feel disposd to cum Out of Your self I will aford evry Falicity towards your hapiness. I dont want to hurt your Felines but since the Cotchman as giv yew up I dont think Yew have annother String to your Bo to say nothink of Not being so young As yew was Ten Yeer ago and faces Will ware out as well as scrubbin brushes. theirs a verry nice yung man is quit a Willin to offer to Yew providid you cum the verry Next vessle for He has Maid up his mind not to Wait beyond the Kupid and Sikey. as the Ship is on the Pint of Saling I cant rite Moor at pressent xcept for them has as shily shalying Sweat harts to Thretten with cumming to Vandemins And witch will soon sho wether its Cubbard love or true Love I hav seen Enuff of Bows droping in at supertime and falling out the next morning after borrowin Wans wags. Wen yew see anny Frends giv my Distant love to Them and say My being Gone to annother wurld dont impear my Memmery but I offen Thinks of Number 22 and the two Next Dores. yew may Disclose my matterymonial Prospex to betty as we hav allways had a Deal of Confidens. And I remane with the Gratest assurance Your affexionat Frend Susan Gale.

P.S. Deer mary my Furst Match beeing broke off short. hope Yew will not take it Ill but I hav Marrid the yung Man as was to Hav waited for Yew but As yew hav never see one Annother trusts yew will Not take Him to hart or abrade by Return of Postesses he has behaved Perfickly honnerable And has got a verry United frend of his Hone to be atacht to Yew in lew of him. adew."

By an unlucky misrecollection, Earl Spencer's name was given in a late article, instead of the Marquis of Blandford's, as the purchaser of the celebrated Valdarfer Boccaccio. Earl Spencer was the competing bidder, and stopped at L.2250. The Marquis, who is now Duke of Marlborough, bade L.2260, and "after a due pause," says the bibliomaniac Dibdin, "the hammer fell. The spectators," continues that quaint writer, "stood aghast, and the sound of Mr Evans's prostrate sceptre of dominion reached, and resounded from, the utmost shores of Italy. The echo of that fallen hammer was heard in the libraries of Rome, of Milan, and St Mark. Boccaccio himself started from his slumber of some five hundred years; and Mr Van Praet [Napoleon's librarian] rushed, but rushed in vain, amidst the royal book-treasures at Paris, to see if a copy of the said Valdarfer Boccaccio could there be found!"

Messrs Chambers again respectfully notify, that they do not require and cannot accept of any communications, either in prose or verse, for their Journal, which is conducted on a uniform fixed principle, requiring a great deal of care in the composition, and therefore liable to serious injury if intruded upon by matter not in strict accordance with the leading features of the work. They have also to mention, that they have made it a rule, from the first, of never answering correspondents, anonymous or otherwise, through the medium of their publications, in order that their pages may not be loaded with matter which can only be interesting to *one* out of fifty thousand individuals. All letters not post-paid are returned to the Post Office without being opened.

London: Published, with Permission of the Proprietors, by Orr & Smith, Paternoster Row; G. Berger, Holywell Street, Strand; Banks & Co., Manchester; Wrightson & Webb, Birmingham; Willmer & Smith, Liverpool; W. E. Somerscale, Leeds; C. N. Wright, Nottingham; Westley & Co. Bristol; S. Simms, Bath; J. Johnson, Cambridge; W. Gain, Exeter; J. Purdon, Hull; G. Ridge, Sheffield; H. Bellerby, York; J. Taylor, Brighton; and sold by all Booksellers, Newsmen, &c. in town and country.—Chambers's Historical Newspaper, a Supplement to the present publication, is published on the first of every month; and Chambers's Information for the People, of which every number is a distinct subject of human knowledge, appears once every fortnight.
Stereotyped by A. Kirkwood, Edinburgh.
Printed by Bradbury and Evans (late T. Davison), Whitefriars.

CHAMBERS' EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF "CHAMBERS'S HISTORICAL NEWSPAPER." AND "INFORMATION FOR THE PEOPLE."

No. 100. SATURDAY, DECEMBER 28, 1833. PRICE THREE HALFPENCE.

DEPARTED FRIENDS.

A SENTIMENT—one of the most amiable of our nature—forbids that we should soon or altogether forget the friends who have gone down before us to the dust. To forget is to injure—and who would injure the dead? They cannot, it is true, resent any injury. They can never chide us either for neglect, or for any more positive kind of wrong. Yet, just because we are thus safe from their wrath—just because they lie thus powerless for the assertion of right or privilege—we shrink from doing them injustice. For such an offence our own affections would inflict an infinitely severer punishment than any with which we could be visited by an aggrieved party, however sensible of wrong, or eager to avenge it.

There are lonely and silent moments, when we have only ourselves to commune with, and when the memories of departed friends rise before us, like ghosts, but welcome and pleasant ones, each bringing back his own well-remembered face, with a long train of associations, by which he is more or less endeared to us. Such shadowy reviews have a marvellous pleasure in them; for in the very act of thus protracting, as it were, the existence of the departed, we assure ourselves so far that it is a duty which the living are not apt to neglect, and consequently that when we ourselves shall have submitted to the stroke of fate, there will be some kind survivors who will not let us *all* or *suddenly* die, but, erecting a shrine for our image in the temple of their hearts, carry us in some measure victorious over the grave. Even as the spring-flower comes and sits on the bed of the dead, so does the sweet memory of a departed friend steal into our thoughts, and flourish and blossom there. It will no doubt be in time trodden down by the rude feet of worldly necessities; or as one floral year succeeds another, even so will the remembrance of one set of friends be displaced by new griefs and new recollections. But still let us cling as long as we can to these pleasing images, and afford them all the space and breadth in our souls, which the pressure of existing things will by any means admit of.

The state of mind which immediately ensues from the loss of a friend or endeared relative, has never perhaps been fully estimated either in the pulpit or in the study. One mistake prevails universally—a supposition that it is for our own loss and damage that we shed these burning tears. "Consider," cry those who mean to console us, "that you have many blessings left behind, which ought to make this bereavement seem of the less account." Alas, it is not for ourselves that we grieve—it is for the dead. Absurd as the feeling may be, we melt in overpowering sympathy with those who are now beyond all pain and sorrow—we compassionate them for the awful calamity which has befallen them—we grudge to see ourselves so happy as still to possess life and health, and the power of enjoying this too-dear world, while they have been so signally unfortunate as to lose all—and, though religion may busy itself to point out the probability of an improvement in their state, still it is for the disaster of death, which we have seen our friend encounter, with all its harrowing circumstances, that we chiefly weep. Perfect reason may condemn this conduct; but it is so natural, and at the same time connected with so many of the better affections, and so useful, we are persuaded, in palliating the horrors of death, that we cannot wish it to be otherwise. The expectation that our decease will be beheld with a kind sympathy by some who are destined to survive us, is not what ought to be our chief support against the terrors of that crisis: but it may tend materially to soothe life in its decline, and eventually to cheer the gloomy hour itself—and who, since such is the case, could wish it to be precluded?

Of this feeling of sympathy for the deceased, the tender recollection of them at a later period is just a continuation. We cease to regret so deeply the actual calamity of death; the agonising distresses of the scene revisit us less frequently in our sleeping and waking hours; the fierce and raging grief fades gradually away. Then, however, dawns the moonlight of a gentler sorrow. We start in the midst of a cheering domestic scene, and regret that *he* is not here to participate in it. The thought suddenly strikes us, in the busy marts of the world, that all this is what *he* once formed a part of, but will mingle in no more: it is still the same, but that *he* is not of it. We sit in the solitude of twilight chambers, and, looking forth upon the stars, as they one by one step out upon the threshold of night, reflect that he but as yesterday could behold them, and speculate upon their nature and purposes, as we do now, but since then has been huddled away into oblivion, while *they* continue shining on and on with the majestic continuity of inanimate existences. The idea of his re-appearing as usual before our eyes, will for months—perhaps in some cases for years—intrude at times upon the imagination; and still when reason comes in to dash the vision, the regretful feeling will arise—he comes not, he cannot come again. This habit, however, lingers long, and is loath to part. Even after it has been banished from our daily thoughts, it will cling to the dreams of night, and thus, as it were by a refractive power of the intellect, is the image of the departed kept up before us. We see him enter and take his usual place; we hear him speak; we address him and are replied to; we do not remember that he is dead, but yet there is something not earthly about him—the glimmering pallor of a dream—and his speech and deportment are not like those which characterised him in life. The vision at length departs, and, though it leaves tears and terror behind, how fondly do we wish that it had staid! Often in this manner does the bereaved mother strain her lost child once more to her beating bosom. Nature in this case finds unusual difficulty in forgetting the lost one. The infant is a part of the mother's very existence; is connected by ties which none but herself can feel or comprehend; and when she sends it away to the grave, she does something which her reason will hardly convince her to be a reality. One who had suffered this dreadful calamity, and just at that period in the life of the infant when in general it is most endeared to the parents, used to relate that for a long period she saw her child once more almost every night. Sometimes the endeared vision was presented to her in one way, and sometimes in another; but on all occasions the infant appeared to be alive. In one particular instance, she conceived that she was led to see the grave in a lonely churchyard. It was one of many such little mounds which filled the place, and beside which stood many other mothers, in the same situation with herself. Presently, the graves were all opened, and the children came forth to play. She and the other mothers surveyed the scene with pleasure inexpressible; but yet, in all their sports, the infants did not appear to be naturally alive, nor did the mothers seem to understand that life was there, or that they had regained their lost treasures. It was only a pageant, vouchsafed to satisfy so far the yearnings of affection: the scene was still a churchyard, and in the same place they knew it would end. Accordingly, when the proper time had come, each mother took her own child, wrapped it tenderly in its sepulchral attire, and with her own hands replaced it in the grave; after which, they all slowly and mournfully withdrew. The dreamer then awoke, as she usually did after such visions, in tears.

The preservation of the memories of lost friends is not only a good exercise for the affections, and the source of a pleasing hope to all who are yet to die, but it is calculated to have a soothing and refining effect upon those who reasonably indulge it. Our departed friends always appear to us in the light of beings removed to a purer existence and a higher state of intelligence, so as to be enabled to see and judge correctly of all our thoughts and actions. If we bear them any respect, we will hesitate, under this ideal censorship, to do things which are unworthy of us, and for which perhaps the present world has no punishment. We will try, on the contrary, to be as pure in thought and deed as possible, in order that we may be the more pleasing to those who, we conceive, are altogether pure, and whose esteem we naturally desire to conciliate. In the midst, too, of the bustle and shock of the present life, when little interests and petty jealousies are rearing themselves like serpents in our hearts, how salutary to reflect that all the advantages we can now seek either to gain or to defend, are but trash and dross in the estimation of those from whom we lately parted, and in no long time will be the same in our own. Are we provided with a large share of such goods as this world has to give, then will we control our appreciation of them, by reflecting of how little account they will be when we have rejoined those friends in another world. Are we poor, and injured, and friendless, then will the recollection of our departed friends tend to cheer us, by presenting the idea of their superiority to all such evils—a superiority soon to be our own.

THE START.

IN all that relates to the serious affairs of life, it is of great advantage to have "the start" of all who are likely to become competitors. Those who are the first to attract general attention to their invention or their labours have ever the best chance of being the most successful; and so frequently is this the case, that it is proverbial to say, "that those who follow must always be behind." Nevertheless, this advantage is proved not to be by any means permanent: continued success can only be obtained by great exertion in keeping ahead of all who may afterwards start in the same career; for the world, on the whole, will not for any length of time patronise those who do not continue to come up to their expectations and ideas of excellence.

Many people who have gained "the start" in speculations do not seem to be sufficiently aware of the danger of losing their first advantages. Because they once gained and still possess an eminence, they are apt to imagine that none will climb beyond them; and so they get careless of keeping their footing, and are ultimately undone. When a man is so simple, or so unfortunate, as thus to lose his early advantages, he is sure to fall under greater disrepute than if his inferiority had been apparent from the beginning. The world applauds his efforts as long as they promise to be attended with success; but when they fail, those persons who applauded in the beginning are indignant to find that they have been deceived, and join in the laugh at his defeat with a degree of bitterness perhaps greater than is commendable.

In a footrace, some years ago, one of the runners sprung off at first with an agility which distanced all

his competitors except one, who kept close behind him. As the struggle continued for some time, without any ground being lost or gained, the younger and more inexperienced spectators began to encourage the foremost with the certain hopes of victory; but certain more elderly individuals were more wary: "Wait a wee," said they to the clamorous youngsters; "thole a bit." It was a tempestuous day, the wind and rain blowing direct from the turning-post to the starting-point. For the first half of the race, therefore, the storm beat violently in the face of the one runner, while the other avoided the fatigue of its encounter, and saved his breath and strength, by keeping close in the shelter of his over-sanguine opponent. After passing the starting-post, the hindmost still preserved his position, being now wafted along by the gale, while at the same time he deprived his antagonist of that assistance. On approaching the winning-post, however, he exerted all his unexpended vigour, distanced his now exhausted companion with ease, was declared victor, and triumphantly crowned with the bonnet, the reward of him who overcomes in such contests. The loser was more chagrined with the manner in which he had been made, as it were, to gain the race for another, than with his own failure.

How closely do the chief features of human nature preserve their resemblance through all the variations of rank! This anecdote is an useful illustration of what we frequently happen to notice occurring in every state of life. We find those who once "had the ball at their foot"—who "had the world for the winning"—who set off in a course of prosperity which it was thought nothing would arrest, now brought to, and at a stand, or feebly lagging behind those who at first started long after the others had set out.

The self-confidence which urges many individuals to take a lead in society, if not backed by great natural abilities, is, in the same manner, rarely of any permanent advantage. An eagerness, for instance, to obtain "the start" in conversation, and to engross that attention of which every one thinks himself entitled to a share, procures many enemies, and is sure to end in some notable disgrace—perhaps in the total exclusion of the offender from society. It is in vain that he or she collect parties at home, to hear them harangue, and to admire their accomplishments. The severity of the punishment is wretchedly compensated by the expedient fallen upon to render it nugatory; for plenty of people may be got to come and eat a good dinner, but not one in twenty can be cheated into delight with a tiresome chatterer.

The only circumstances, perhaps, in which "the start" is of *certain* advantage, is where it is accidental—where it precludes the possibility of a living competitor. Homer, even if he had not been superior to Virgil in other respects, would have been more highly esteemed, because he had "the start"—because he was the first in writing an epic poem. In reference to this subject, it has been truly observed, several had been the phœnix of their profession, if others had not gone before them. The first have the birthright in the inheritance of reputation; and there remains but a scanty portion for the juniors—nay, and even that is contested. It is to no purpose for those who come second, to fret; they cannot baffle the opinion which the world entertains, that they do no more but imitate.

THE SEA.

ITS TEMPERATURE.

The temperature of the sea, like that of the air, is liable to be affected by the latitude, and the season of the year, but not to nearly so great an extent as the air. Within the tropics, where the season has hardly any influence, it is generally found at about 80 or 81 of Fahrenheit's thermometer, being somewhat more, in general, than the warmth of the neighbouring air, which is deprived to a certain extent of its heat, in order to carry on the process of evaporation. Taking the month of March as one of those during which the heat of the sun must be equally determined in both directions by latitude, we find that in that month the sea has been found, at 11° 32′ south, of 80.6 Fahrenheit; at 31° 34′ south, of 75.7; at 40° 36′ south, of 59.9; though in some instances it has been found several degrees more or less at the same season, and under nearly the same latitude. The chief cause of the variation is a perpetual flow of water from the poles to the equator, which we shall afterwards explain. It has been pretty nearly ascertained, that, in the tropical seas, it ranges about 9 degrees of Fahrenheit; in the middle of the temperate zone, about 12; and after that, decreases with a more rapid and more equable gradation. The temperature of the sea is also affected by its depth. In deep seas between the tropics, the heat diminishes towards the bottom; while, in more frigid latitudes, it is sometimes observed to become warmer. The sea is a bad conductor of heat; the solar rays can only penetrate about three hundred feet below the surface, nor does the light descend any farther. A small difference is observed between the observations on temperature in the two hemispheres. For the first 25° towards the south, the decrease of heat is slower, and after that more rapid, than towards the north.

It must be evident to every one who considers the great mass of waters composing the ocean, and the interchange of position which must always be taking place, to a greater or less extent, between the upper and warmer parts and the lower and colder, that this comparative equability of temperature is unavoidable, even if there were no other causes to account for it. The uses of that equability are still more obvious, and must add greatly to the wonder we always experience when the economy of nature is to be surveyed. By this equability, the natural result of high latitude is more or less corrected, for the advantage of the human beings who happen to be so placed. A milder air breathing from the sea softens the climate all over the adjacent land, and produces a freshness which is of the greatest service to vegetation. On the other hand, in those torrid regions where both animated and vegetable nature are apt to sink beneath the vertical rays of the sun, the cooling breath of the ocean comes, generally at fixed times, reviving the parched soil, and communicating to man sensations of relief and pleasure which are hardly to be imagined by those who have not experienced them.

MOTIONS OF THE SEA.

The sea, from its fluid nature, is liable to be agitated and moved in various ways, but chiefly by the tides, by the rotatory motion of the globe, and by atmospherical causes. Having fully explained the tides in our work styled Information for the People (article *Astronomy*), we shall omit the subject in this place.

The rotatory motion of the globe from west to east is believed to be at least the main cause of the currents which prevail in all the great oceans, and a knowledge of which is of such importance to the mariner. The solid part of the globe leaves, as it were, the fluid behind; and hence there is a perpetual flow of the sea from the western coasts of Europe and Africa towards the eastern *landboard*, as it is called, of America, and from the west of America to the eastern coast of Asia. This movement is chiefly confined to the tropics, unless where the sea is turned aside by the land, and caused to diverge towards the north or south. If we start in a survey of this motion from the western coast of America, we find it producing a constant current across the vast expanse of the Pacific, till it is turned off by Asia and Australia. A great division of its force is directed through the seas on both sides of the latter continent, and so on through the Indian Ocean, and round the Cape of Good Hope, till it reaches the free expanse of the Atlantic, across which it proceeds in the same manner as across the Pacific. The current of the Atlantic strikes the coast of Brazil, and breaks at Cape St Augustine into two divisions, one of which proceeds round Cape Horn into the Pacific, while the other advances through the Caribbean Sea, and so on into the Gulf of Mexico. This latter branch conspires, with the vast issue of fresh waters which pours into the Gulf of Mexico, to raise the level of that sea above that of the neighbouring ocean, and, causing the surplus to force its way out between Florida and Cuba, produces the celebrated Gulf Stream, which is perhaps the most powerful sea-current in the world.

To the mariner, as already mentioned, these currents are of great importance. From Portugal, for instance, ships have sailed to the Bights of Benin, on the Guinea coast, being 150 leagues, in two days, though they could not return in less than seven weeks. It is also common for vessels to descend to the latitude of the Canary Islands, in order to get into the tropical current across the Atlantic, which carries them to America in a comparatively short time: it was by this current that Columbus was carried so smoothly on in his first voyage to the new continent. The Pacific, it is said, can be crossed in this way in about ten weeks, being at the rate of 1000 miles per week; and some mariners have expressed an opinion that China might be reached by this route in less time than by the shorter course round the Cape of Good Hope.

For the same reason that the sea flows from east to west, the air has a tendency, when not counteracted by other causes, to move in the same direction. The earth in its motion leaves the air, like the sea, a little behind it; in other words, does not carry it so fast forward: hence what are called the trade-winds, which, operating in the same direction with the sea-currents, increase the facility of navigation to the westward in a very great degree. We shall have occasion, perhaps, in some other place, to treat more minutely respecting this species of aërial current, as well as of winds in general. In the meantime, it is impossible to avoid remarking, that these natural phenomena, which, it is to be supposed, might have been counteracted or neutralised from the beginning, must have been designed for some end useful and necessary in the economy of the world. Perhaps, like the diffusive powers given to the seeds of certain plants, they were intended to aid in the dispersion of the human race over the globe. It is well known that population exists in many places, which appear cut off from all connection with others, by seas that must have been impassable by navigators in the early ages of their art. Men could only be drifted to such places, in early ages, by the currents of the sea and air; and thus the cultivation of large and important regions must have commenced much earlier than would have otherwise been the case.

Besides the grand equatorial or tropical current, there is one of a less decided character from the poles to the equator. The sea under the tropics evaporates to a greater extent than elsewhere, by the influence of a vertical sun. The vapours are apt to proceed towards the north and south, where they descend in rain. A surplus of water is thus produced in the high latitudes, which naturally flows back towards the equator. Hence a constant, but comparatively slight flow from the north and south towards that warmer region of the earth. Under the influence of this stream, large masses of ice are constantly becoming detached from the polar stores, and drifted to the tropics. In some of the bays on the north side of Iceland, this frigid substance comes in vast quantities, insomuch as to choke them up to the depth of 500 feet. What is still more strange, these masses of ice are sometimes mixed up with trees, some of which are known to be the produce of the torrid zone in America: this is accounted for by the action of the northern division of the great current which parts at Cape St Augustine. That northern division, after rushing into and out of the Gulf of Mexico, proceeds northward to Newfoundland, and thence at a high latitude returns athwart the Atlantic, finally sweeping along the western coasts of Europe, and rejoining the current which gave its first impulse. By this current, it is supposed, American timber may easily be carried to the northern shores of Iceland.

The operation of the tides is less observable in the great currents we have alluded to, than in those which prevail in the more secluded seas. The abstraction of water from a secluded sea by the recess of the tide, and the rush inwards produced by its flow, are sufficient of themselves to cause very impetuous currents, more particularly in the narrow channels by which the inland seas are connected with the ocean. We find it stated, in a pamphlet which happens to be lying before us,* that the Pentland Firth, which separates the continent of Great Britain from Orkney, "has no fewer than four-and-twenty contrary currents of the tide at the flood of spring, beside numerous sets and eddies, which, under the local names of *wells*, *swelchies*, *roosts*, and *rulls*, boil more madly on the Orcadian shore, than ever did witch's caldron on the kindred coast of Norway, if we may believe old tradition and Bishop Pontoppedan. 'The Boar of Papa,' at the opposite extreme of Orkney, is another terrible tide; when he gets a vessel in his tusks, he shakes the masts out—an operation which, in the country phrase, goes by the name of *hackling*." The contrariety of influences which are sometimes brought into play by polar and equatorial currents, and those produced by the tides, occasions many phenomena, extremely perplexing, and sometimes very dangerous, to the navigator. In the Cattegat, by which the Baltic is connected with the German Ocean, one current always goes in by the side next Jutland, while another issues forth by that nearest to Sweden. In like manner, a current seems to proceed along the eastern coast of Britain towards the south, while another, flowing in an opposite direction, advances along the coast of Holland. What is still more curious, under-currents are sometimes found going in a contrary direction to those upon the surface. In the Straits of Gibraltar, it is said there is always a surface current going in, as if to supply a want in the Mediterranean, while, at a certain depth, there is another going out. So strong and so steady is this contrariety in the Caribbean Sea, that a boat may be moored by dropping a heavy substance to a certain depth; the upper current impels the boat one way, while the under one draws the sunk object another, and between the two the boat is steadied.

Two currents of equal force, but of different directions, meeting in a narrow passage or gut, will cause what is generally called a whirlpool, and has ignorantly been said to be produced by subterranean rivers, gulfs, chasms, &c., but essentially is only an eddy, produced by the contact of two currents, which, as if meeting on a centre, whirl round, as it were, in each other's arms! The whirlpool named the Euripides, near the coast of Greece, alternately absorbs and rejects the water seven times in twenty-four hours. Charybdis, in the Straits of Sicily, absorbs and rejects the water thrice in twenty-four hours; and the Maelstroem, on the coast of Norway, which is considerably the largest, absorbs, every six hours, water, ships, whales, in short, every thing that approaches its malignant influence, and the next six hours is employed in casting them up again. These eddies are sometimes augmented by the force of contending tides, or by the action of the winds. They draw vessels along, dash them upon rocks, or engulf them in their furious vortices, the wreck not appearing until some time after.

It now remains for us to notice those motions or agitations of the sea, which are produced by winds. The slightest breeze that blows, it is well known, will ruffle and swell the surface of water, even in a little

* Orcadensis to William Cobbett, M.P on the Political Grievances of Orkney and Zetland.

pool. A violent wind, exerted on a large mobile mass, will of course produce a corresponding degree of turbulence. Hence, in large seas, a storm raises the surface into billows as high as mountains, which often bury the adventurous mariner in their bosoms. These various oscillations of the sea are caused by the currents of air dislodging a portion of the waters, and thereby destroying the equilibrium which they are every moment endeavouring to regain; a movement similar to that of a pedulum. It is amazing, however, how superficial is the most terrible tempest. Divers assure us, that, in the greatest storms, calm water is found at the depth of ninety feet.

Marine waterspouts are also caused by the action of atmospheric currents, and are as dangerous in their effects, as they are calculated to inspire no small degree of wonder. Malte Brun thus describes them:—"Underneath a dense cloud, the sea becomes agitated with violent commotions, the waves dart rapidly towards the centre of the agitated mass of water, on arriving at which they are dispersed into aqueous vapours, and rise whirling round in a spiral direction towards the cloud. This conical ascending column is met by another descending column, which leans towards the water, and joins with it. In many cases, the marine column is from fifty to eighty toises (fathoms) in diameter near its base. Both columns, however, diminish towards the middle, where they unite; so that here they do not extend more than three or four feet in diameter. The entire column presents itself in the shape of a hollow cylinder, or tube of glass, empty within. It glides over the sea without any wind being felt; indeed, several have been seen at once following different directions. When the cloud and the marine base of the waterspout move with unequal velocities, the lower cone is often seen to incline sideways, or even to bend, and finally to burst in pieces. A noise is then heard, like the noise of a cataract falling in a deep valley: lightning frequently issues from the very bosom of the waterspout, particularly when it breaks; but no thunder is ever heard."

Sailors, to prevent the imminent danger which their vessels would be exposed to by coming in contact with these tremendous columns, discharge upon them a cannon ball, which, passing through them, causes them invariably to burst, and consequently removes all chances of injury connected with them. This phenomenon is accounted for in the following manner:—Two winds meet—a vortex ensues: any cloud which happens to lie between them is condensed into a conical form, and turned round with great velocity: this whirling motion drives from the centre of the cloud all the particles contained in it; a vacuum is thereby produced, and water, or any other body lying beneath this vacuum, is carried into it upon the usual and well-known principle. The cannon ball, breaking this cylinder, which is always partly hollow, causes it to fall to pieces, in the same manner as a touch upon the surface of a soap-ball reduces the resplendant mass to a drop of common water.

THE FIRST THEFT,

A STORY FOR LITTLE GIRLS.

[My Dear Little Girls—I have often given columns for the boys upon various entertaining subjects, which I daresay you have sometimes read with as much pleasure as if they had been specially devoted to your perusal; and I am now going to tell a nice little story addressed particularly to yourselves, although no one can be the worse for reading it. It is taken from a neat small volume, just published in Edinburgh, called the "Infant Annual," which contains many such pleasing stories for girls, and which, if you behave yourselves properly, some one may perhaps buy and give to you as a Christmas present. The story is intended to show the great danger of committing even the smallest theft, and is calculated to make an impression on all young people for their good.]

Emily Ascott was about ten years old, her mamma was in very bad health, and had for many months been wholly confined to her bed. She had no family but Emily and a little boy about four years old. Emily was a very good little girl; up to the time I am going to tell you of, she had been the greatest comfort to her parents; she was very attentive to her lessons—tried as much as possible to avoid giving trouble, and to be as useful to her mamma in every way as she could. Every morning she made breakfast for her papa, sat at the head of the table, and poured out his tea for him; and when his breakfast was over, she put away the sugar, the marmalade, and all the things that had been used, locked the tea-caddy and the side-board, and took the bunch of keys into her mamma's room before she went out to school at ten o'clock.

Emily was passionately fond of sweet things. Now, it cannot well be called *a fault* for a little boy or girl to be fond of sweets; but I have often thought it was a great misfortune, both to mind and body, for, if it is not early and judiciously restrained, it leads to many disgusting and disgraceful faults, both in childhood and manhood. A greedy, self-indulging *child* will most surely be a greedy, self-indulging man or woman. The greed of sugar-plumbs and tarts no doubt goes off with childhood, but the *greed* remains behind, only directed to other objects—more important, more culpable.

For a long while after Emily was entrusted with her mamma's keys, she continued most strictly honest and faithful, though often sorely tempted, when she was taking out jelly or marmalade for breakfast and tea, to taste a little of it herself. One morning she was taking out sugar from the canister into the bowl, and a piece fell; Emily sought on the floor, but could not find it; but after she had taken the keys to her mamma's room, she observed the bit of sugar lying under a chair; she picked it up; it was a nice large piece, she thought; "I'm sure it's not worth while to go for the keys to put back this one bit of sugar—I think I'll just eat it." She did so, and thought it was excellent; but even while she was crunching it in her mouth, the thought rose up in her mind—"I wonder if it was dishonest of me to eat this?" and she endeavoured to persuade herself that the sugar having *fallen*, made it not dishonest in her to take it. Next morning she purposely let fall another piece, and did *not* look for it, and then in the same way she picked it up afterwards and ate it; she found it very difficult to persuade herself that *this* was not dishonest, so she tried not to think of it at all.

Once or twice her little brother came toddling into the room when she was thieving, and she trembled from head to foot lest he should notice what she was about. Once it occurred to her—"Oh, how wrong what I am doing must be, since I dread even a little infant seeing me."

Thus, my little readers, did unfortunate Emily *begin*, and I beg you will observe that the great misfortunes which she came to endure never would have happened but for this *trifle*, as some would call it; but nothing, however small, is a *trifle* that *begins a sin*.

She very soon gave up the ceremony of letting the bits of sugar *fall*—instead of that, they were thrust into her pocket, not one at a time, but at last in whole handfuls. At length, one morning, when she was at this work, and had pushed more pieces into her pocket than she had ever done before, she felt herself suddenly caught hold of by the arm, and rudely whirled round. Emily grew blind with terror lest it was her papa; and it was some relief to her to find it was only Sally the housemaid. This was a servant against whom her mamma had frequently warned her, and desired her on no account to have any familiarity or communication with, because she had not a good opinion of her. "Oh ho, Miss," cried Sally, in an impertinent tone, "so I've caught you; that's the way you go on, is it, when your mamma gives *you* the keys, instead of giving them to *me*, as she ought to do! I'm very glad I've found you out, however. I'll soon let your mamma know what a fine steward she has chosen for her keys—ha, ha, ha!" Emily felt her heart burn with indignation at this insulting language from a servant; but what could she do? *She was degraded by her own conduct*, and *dared* not resent it. So far from that indeed, that, in the most humble and pitiful manner, she besought the insolent Sally not to inform her mamma of what she had seen; but Sally was too cunning to yield to her entreaties without making her pay dearly for it; so she pretended to be quite immoveable. Driven to desperation, the weeping Emily threw herself on her knees before her—"Oh, Sally, *dear* Sally, don't tell upon me, and I'll give you every thing I have in the world; I'll give you my four half-crowns, Sally; I'll give you my four half-crowns."

"What do I care for your half-crowns, forsooth!" said the wicked woman; "its not a dirty four half-crowns that 'll make me let you go, I can tell you, Miss thief."

"Oh Sally, Sally, tell me what will you have? and, if I can, I will give it you," cried the miserable child.

"Well, well," said Sally with a sneer, "rise up and dry your eyes, and in the first place let's see the half-crowns."

Away Emily ran and brought her treasured half-crowns, her birth-day present from her father! How proudly had they been received, how proudly kept; and *now*, how were they going? To buy the concealment of her guilt? Was the poor pleasure of eating bits of sugar or spoonfuls of jelly, or eating *any thing*, worth such a sacrifice?

Sally deliberately put the four half-crowns in her pocket, and then said, "now, you must give me some tea."

"Tea!" repeated the trembling Emily, "I have no tea."

"Havn't you the keys, you blockhead," said Sally, with a loud laugh; "havn't you the keys of the tea-box?"

"But, Sally, that is mamma's tea; I dare not take it to give to you."

"Oh ho," retorted Sally, "you've grown *honest* all of a sudden, have you, Miss? Very well, good bye t'ye; I'll go and tell your mamma this very moment what I found you doing." And she walked towards the door. Emily flew after her screaming,

"Oh, don't, don't tell mamma—Sally, I implore you do not."

"Will you be a rational good girl, then, and give me some tea? What do you make such a fuss about? it's no more than your mamma would do if she were up. She often gave me tea—ay, as much as a pound at a time—in a present."

"Did she, Sally?" said Emily, feeling that it was a lie the woman was telling, yet eager to believe any thing that made her own conduct appear less culpable. "Did she really?" repeated she.

"To be sure she did," said the wicked Sally, with the greatest effrontery: "Come, come," she added, "just give me the key and I'll take it, and then it will not be your doing, you know."

Emily's hand shook, and her conscience bitterly condemned her when she allowed Sally to take the keys with which her good kind mamma had entrusted her, and help herself to a quantity of tea, and sugar also. She did not dare to go to her mamma's bedside to bid her good bye, as usual. She laid down the keys on her table, and slunk out of the room. All day at school she was more utterly wretched than I can describe; and many, many were the repentant resolutions she formed, never never, while she breathed, to be guilty of even the smallest theft. Her thoughts were not upon her lessons, so that all went wrong, and every one of her masters was angry with her.

She had medals both in the French and grammar classes, and had kept them for more than a week, but that day she lost them both. She came home miserable, dejected, and humiliated. At the door she was met by Sally—she started back with horror and disgust from her—but Sally was all smiles, and whispering to her she said, "Look in the little press in your own room, and see what I have put there for you."

When Emily went to her room and looked into the cupboard, she found a very nice large apple tart. Now, Emily's mamma had most strictly forbidden her ever to accept of sweet things, or eatables of any sort, from the servants. This order she had hitherto strictly obeyed, but, alas! when we commit one fault, who can tell where we shall end? Had she thought but for one moment, she would have seen that to accept of presents of this sort from Sally, was to put herself more and more in that wicked woman's power, and must make it more and more impossible for herself to keep the good resolutions she had formed of never again being dishonest.

Too late did she find that this was true, for no sooner had she gone into the parlour next morning to get ready her papa's breakfast, than Sally followed her, and shutting the door, told her that she must have some coffee, and a glass or two of brandy for a sick cousin. Emily was quite unprepared for this renewal of Sally's demands—for, like a poor inexperienced child, as she was, she had supposed that the four half-crowns and the tea and sugar of the day before had for ever satisfied and silenced her. Poor little girl! she burst into tears, and begged and implored she would not oblige her to steal any more. Sally only tossed her head, and said, "Oh, very well, Miss; since that's the way of it, I'll just up to your mamma, and tell her what you have done already. There was no word of all this mighty honesty when you were eating the tart I made with the sugar you gave me yesterday. I put every grain of it into that tart—but to be sure I doesn't need to care about it. You may just do as you please."

"Oh," thought Emily, "that I had never never been dishonest, and then I never could have been so miserable!"

She laid her face in her hands and sobbed. Sally left the room, and Emily heard her go up the stairs that led to her mamma's apartment; and unable to endure the agonising thought that she had gone to tell upon her, she flew up the stairs, and beckoning to her, she whispered she would give her what she wanted. Alas, alas, if instead of thus weakly yielding to the fear of her mamma's just displeasure for what was past, she had gone at once to her room, and throwing herself into that dear mother's arms, confessed all to her—oh, how very different would the evil have been! No doubt, a papa or a mamma's displeasure is very sad to bear. The fear of losing their good opinion is a dreadful thing; but, my dear little readers, try—oh try—always to remember how much better and easier confession is when you are at the *beginning* of your faults, than it can ever be again; and that a sincere confession will always bring half forgiveness with it. So well does every good parent know the value of a habit of sincerity in their children, that a *great* fault *confessed* will always be more readily forgiven than a *small* one *concealed*.

Thus it went on, however, for Emily had no one to advise or direct her, and from day to day Sally increased her demands—always taking care at the same time to pamper the poor child's appetite for sweets, and Emily always eating what was offered her, though her conscience all the while upbraided her. At length one morning Sally told her she must leave the keys with her, instead of putting them into her mamma's room before she went to school.

"Oh, Sally," cried Emily, "how can I do that? You know mamma would notice if I did not lay them down on the table as usual."

"Oh pho, no fear; you know your mamma's curtains are always shut; so all you have to do is just to jingle the keys on the table as if you were laying them down, and then fetch them away in your hand. I'm not going to do any harm with the keys; it's only in case any thing is wanted when you're out; it is so strange to say I never have the keys; I always had the whole keys, I can tell you, in my last place."

"I cannot do it, Sally; indeed, indeed, I cannot," said Emily imploringly.

"Well, well, just as you please. I have a fine large pot of sweetmeats I got in a present, and I meant to give it to you; but if so be you won't do that much for me, I'll keep them to myself."

"What sort of sweetmeats, Sally?"

"Fine West India sweetmeats, to be sure."

"And how big is the pot?" said Emily, looking wistfully.

"As big as that," said Sally, holding up her two hands.

"Oh dear me, I would like to taste them! Are they very nice, Sally?"

"Nice! You never tasted any thing so nice al your life. Nice indeed! And I meant to have given you the whole pot just to yourself; but I won't do it now, since you won't do what I'm sure is no favour to me; for what's the use of the keys to me? but only for your mamma's credit I wished to have them, because all other people's servants just quite laugh at her for her scrubbishness, when they see that I have not the keys to keep." The sound of Mr Ascott's footsteps approaching the parlour put an end to Miss Sally's oration, and set her off like shot at another door.

I said at the beginning of my story that greed of sweets, or greed of any thing, was a great misfortune; so it proved to Emily. All day the thought of this pot of West India sweetmeats pictured it to her imagination so large and so large, and so good and so sweet, and so delightful! And must she lose it, only for not leaving the keys with Sally, who said she wanted nothing with them—no harm would be done to mamma by leaving them, surely? Conscience cried out, "Sally wants the keys that she may steal your papa and mamma's property," but Emily tried not to hear the voice of this disagreeable friend, who *always* tells us when we are wrong.

Next morning Sally renewed her entreaties her coax-

ings, and her threatenings, for the keys; and Emily, now shall I tell it, Emily was so base as consent to deceive and cheat her dear good mamma, who was too sick to notice any thing, by jingling the keys on the table at the side of her bed-curtain, and then taking them away to the detestable woman who was thus leading her to ruin. Her hands trembled and her knees shook. At the door she would have turned back and laid them down again, but her enemy was there on the watch, and seizing hold of her, prevented the unfortunate child obeying this suggestion of the good Spirit.

She went away to school, dejected and miserable at what she had done. Instead of thinking with any pleasure on her dearly purchased pot of sweetmeats, she loathed the very thoughts of it. Again she got into disgrace at school, and she returned home wretched and discontented. Sally was waiting for her, as she said, to give her back the keys, and she did so with an assurance that not a place nor a press had she opened while Emily was away. This was some comfort to the miserable child, and she tried to forget that that made no difference in her criminal deceitfulness to her mother.

Time went on, and poor Emily was a very unhappy child. The loads of sweets with which the wicked Sally kept her supplied, and which she, poor infatuated little creature, always ate, kept her stomach constantly uneasy, and undermined her health. She lived in constant dread of detection. If any one came suddenly into the room, or she heard a hasty foot approach her, she would start and tremble, always thinking they came to say her tricks were found out.

Her papa and mamma were afflicted at the change on their once healthy and happy child. Mrs Ascott was still unable to leave her bed, and after a consultation, they resolved to ask Mr Ascott's sister Anne to come and take charge of the house and of Emily. She had formerly been very fond of her aunt Anne, and her papa and mamma were astonished to observe how little pleasure she seemed to feel when told that her good kind aunt was coming to visit them, but my little readers can guess why it was any thing but pleasant to Emily.

The very day after Miss Ascott came, Emily's papa asked some friends to dine with him. Mrs Ascott told Emily to give her aunt the keys, and show her the plate-chest, that she might give out some trays and other silver things which would be required. When Miss Ascott opened the chest, there were no silver trays there; little or nothing in it. "What is the reason of that? Is there any other place in which the plate is ever kept?" said she to Emily, who was standing by. "Not that I know of, aunt," said Emily, looking to John, the footboy, who was waiting for the things. "If you please ma'am," said he, "I saw my mistress put all the silver, saving what we uses every day, in here, just two days afore she was taken ill; they were never out since as I knows of." "Nor me either," said Emily; "I never had the chest open, and I never saw them out."

"It is very extraordinary indeed," said Miss Ascott, "but we must look elsewhere;" so saying, she opened the sideboard, and from it she went to every other place where it was possible such things could be, but in vain; not an article of the sort could be found. Miss Ascott felt much alarmed; but, unwilling to disturb Mrs Ascott, she sent for her brother. While they waited on his coming, she said to Emily, "My dear child, are you sure that you were always careful of your mamma's keys when you had them? You never left them hanging in the locks when you went out?"

"Oh, no, never, I assure you, never," said Emily, reddening excessively.

"Or entrusted them to any other person?" said Miss Ascott, looking very hard at her. Emily grew as pale as death, and seemed as if she would have fainted; for at this question of her aunt's the whole truth flashed upon her mind, that Sally had stolen the plate the day she was so base as leave her mother's keys in her possession! She hesitated and faltered—what should she do? Tell the truth? At the thought of all the disgrace to which that would expose her, the blood rushed back to her face and neck, and her knees knocked together. A few months before, how impossible it would have been for her to utter the enormous falsehood which she now told in the vain hope that it would hide her other sins! "No, no, I never gave them to any body."

As she uttered this lie, her father entered the room, and she took advantage of the earnest conversation that followed, between her aunt and him, to slip out of the room unperceived.

She run, like a poor guilty thing as she was, up to her own room, and throwing herself upon her bed, she gave way to the most violent bursts of sobbing. It is impossible for any innocent child to conceive how very, very dreadful were her feelings. She now for the first time saw her guilt in its true colours—she was a thief and a liar—many many persons had been hanged for conduct less base than hers. Her father had been robbed, she heard him say as she left the dining-room, to the amount of L.200; and all this had arisen from her detestable greed of eating sweetmeats.

As she lay upon her bed agonising with bitter repentance, she was much surprised to hear her papa, accompanied by a strange coarse man, going up the garret stairs.

Her papa and the man went straight to the door of the room where Sally was, and finding it was bolted inside, they knocked.

"Who is there?" said Sally, in a sharp voice.

"Open this door instantly," said Mr Ascott.

"Oh, dear me, sir, is it you?—I'm sure I'm very sorry, but I cannot open the door just yet—for—for—I'm dressing, I'm dressing, sir."

"Open the door instantly—or I'll order it to be broken up," said Mr Ascott.

After a considerable bustle within, the door was opened. She heard her papa say, as he entered the room, "You are, no doubt, aware that a great quantity of silver plate has disappeared. I have got a warrant, and a king's officer to search every part of the house—the trunks of your fellow-servants have already been searched—you have I suppose, no objection that yours should be the same?"

"I don't care a snuff where you search," said Sally, in an insolent tone.

"I'll thank you for your keys, mistress," said the officer.

"I've no keys to give you," answered Sally. "I'm none of your thieves that has any thing to hide under locks and keys—no, no, my places is all open, search where you please."

The officer sought all her boxes, and a chest of drawers that was in the room, but not a thing did he find. Sally, nothwithstanding Mr Ascott's presence, could not restrain her insolent triumph at this; but when the officer next approached her bed, to search it, she became quite outrageous—saying, "It was a shame to be heard of, any man being so impertinent as to meddle with *her* bed."

The officer was, I suppose, accustomed to be talked to in this manner, for he paid not the least attention, but coolly lifted up the bed-clothes, and then rolled up the mattress, shook it, and felt it in every direction. Under this there was another mattress, but when he attempted to raise it, he found it was firmly nailed to the bedstead round and round.

"That mattress," said Sally, "never was up since *I* came to the house. I found it as you see it—so it's no use searching there, I can tell you."

"We'll see what it's made of, any how," said the man drily—and he pulled out of the lappel of his coat a long steel needle, like what upholsterers use; and pushing it forcibly into the mattress, it instantly struck against something that sounded like metal. He immediately began with his pen-knife to rip open the mattress. Mr Ascott turned round at this moment to take a look of Sally, and saw her just whisking out at the door—he darted after her, and dragging her back again, locked the door, and put the key in his pocket.

"You had better have let me go—you had better, for your own sake, Mr Ascott," cried she, almost choked with rage and agitation. I'll make you repent bringing me back—that I will."

Mr Ascott paid little attention to her threats—for now the officer had got the whole cover off the mattress, and there, nicely packed, lay, not only the silver trays, and other things, but a number of Mrs Ascott's finest damask tablecloths and napkins.

"How came these things here, can you tell me?" said Mr Ascott to Sally.

"Oh yes," replied she, with a grin of the most malignant defiance. "Since you are determined to know, I'll soon tell you: It was your own daughter Miss Emily that stole them, and gave them to me to keep for her, that she might dispose of them by degrees, as she needed the money."

"Hold your peace, detestable, lying wretch," said Mr Ascott, stamping his foot, "nor dare to utter such nefarious falsehoods of my child."

"Oh, you need not go into such a funk about it, and abuse me for a liar," said she, with the greatest audacity; "go to her room, and you'll find a dozen of empty pots of Indian sweetmeats she stole, as well as these things—and what's more, you will find the pawnbrokers receipts for the silver things that are not here, and the necklaces and trash she bought with the money."

Alas! my little readers, you already know that Emily was a guilty child, though far from so wicked as Sally made her appear; but the sweetmeat pots *were* found in her room, her father recognised them as part of a large box of preserves sent to him from the West Indies some time before, and the convicted Emily could not deny she had secretly eaten the contents of them; the necklace, too, and the pawnbroker's receipts, were found in her drawers.

You will easily guess that it was Sally who had put the receipts into her drawers, to make her appear more guilty than she really was. But it is the peculiar misfortune of liars not to be believed, even when they speak the truth. It was in vain that Emily wept and screamed at the very mention of such a thing as her stealing the plate and the table-linen; it was evident that she *had* been a thief, she could no longer deny it—she had also been a liar—she had betrayed her mother's trust—and no one, no, not even her fond father, the father that had almost idolised her, would believe her, or could look at her but with disgust and abhorrence.

At length she made a full and complete confession to her father of all that had taken place; told how she first was tempted to become dishonest, and how she fell under the power of the detestable Sally; and from the cowardly fear of confessing a little fault to her mother, was led step by step into such great wickedness, and such great misery. As I have already told in the story of "The First Lie," it is quite impossible for a little child to conceive the dreadful wretchedness of a parent's feelings, when forced to see that the darling, whose peace and welfare is the dearest object they have on earth, has, in spite of all their cares, become wicked and miserable and disgraced.

Emily was not a hardened child, and she felt as if every tear her father shed over her disgrace was a drop of scalding lead upon her own heart.

Sally was taken to prison, and soon after was tried for her life. In the open court she had the audacity to persist in saying that Emily assisted her to steal the silver plate, and that the necklace and other toys were what she received as her share. It is not easy, however, for a person to persist in a falsehood in a court of law, amongst people accustomed to examine criminals, without contradicting themselves so much as to show that it is a falsehood. And this, added to the evidence of the other servants of the house, who had been observing more than Sally was aware of, made it evident that poor Emily was innocent of all knowledge of the use the wicked woman made of the keys. But only fancy to yourselves what you would feel to be exposed in a court of law, amongst such a crowd of strangers as Emily was! and obliged to hear it told over and over again, how she had thieved, told lies, and deceived her parents. If you can form any idea of her agony, let it be a warning to you—never forget, and try to remember it, when you are tempted to commit your "First Theft," try to remember, that when you have once entered ever so little on the crooked path of dishonesty, it is utterly impossible to tell how far it may lead you, or in what miseries it may land you.

When Emily lay down that night on her sleepless bed, she thought her punishment was full—she little knew what was yet in store for her! Mr Ascott had tried to keep all that had happened a secret from Mrs Ascott, dreading the bad effect the agitation might have upon her health.

At last, however, it became impossible to conceal it, for she saw something was wrong, and insisted on being told what it was. He tried to make Emily's conduct appear as little disgraceful as possible; but when she learned even his account of it, and that Emily had been in a court of law, she could not stand it—she fainted again and again. A new attack of her disorder came on, and in a week after, Emily saw a band of sad mourners, with her almost distracted father at their head, move away from the door, bearing to the grave the blessed and the lovely mother she loved so fondly, whom she could have died to save, and yet whom her conscience told her she had murdered.

Years have passed since that sad day, and Emily still lives to mourn over it. It is by her own request I have written this her sad story for you, my little friends—and she bids me tell you, that there was one mistaken idea she had, which was in a great degree the cause of all her sins and sorrows. She thought that if it was only things of no great value she stole, that it was but a *little sin*. This is indeed a very mistaken idea. It is not said, "Thou shalt not steal any thing *valuable*," but simply, "Thou shalt not steal,"—and the *smallest* theft we can commit is as much a breaking of this law as could be the very *greatest*, particularly in children of your rank, who have not the excuse too many poor little criminals have, that they are driven to it by starvation, bad advice, and bad example.

CURLING.

Curling is a game of great antiquity and popularity in the southern part of Scotland. It is a winter game, and, when the ground becomes covered with snow, and the brooks are frozen, usually supersedes all other out-of-door amusements. The game, in its principles, resembles that of golf. It is played by a party forming rival sides, each individual being possessed of a circular stone, of about nine inches in diameter, flat and smooth on the under side, and, on the upper, having a handle, fixed to the stone. Each player is likewise armed with a broom, to sweep the ice, in order to accelerate the progress of the stones; and his feet are ordinarily furnished with trampets, or crampets, which help to steady him in taking his aim. A large long open space of ice, called a *rink*, being cleared, and a mark or *tee* being made at each end to play to, the contest takes place, by each person hurling his stone towards the opposite end of the rink. A certain number being the game, the object of each side is, which will have the greatest number of stones nearest the tee; and all play from end to end alternately, till this is ascertained. To hurl these stones with precision, in this species of sport, is exceedingly difficult; much depending on the keenness of the frost, the tone of the ice, and the truth of the stone. Sometimes the very best and oldest players are baffled by beginners, simply by their curling-stones having taken a bias to one side or another; and frequently, after the best players have placed their stones in a cluster round the tee, one rapid shot from an antagonist will disperse the whole in all directions round. Occasionally, it also happens, that, in hurling, the stones come far short of the mark; but if they do not get beyond a line, called the *hogg score*, they are dragged aside, and are not counted. A more than usually extensive match is called a *bonspiel*.

Such is a meagre outline of the game of curling, which, all over the west and south of Scotland during the keen frosty days of winter, engages all classes of persons in its exciting sport. Parish contends against parish, county against county, club against club, in universal mirthful rivalry. So keenly is the game pursued, that, in many places where there are no natural brooks, artificial ponds are formed at the approach of winter, for the purpose of being frozen. At Edinburgh, where there are neither rivers nor ponds, the inhabitants resort for the amusement of curling, as well as skating, to the adjacent beautiful small lake at Duddingstone, lying at the south-eastern base of Arthur's Seat. Here a most animated scene is exhibited during the period that the waters of the lake are frozen. Numbers of rinks are cleared, at which may be seen playing together persons in almost every shade of society—professors of the university, clergymen, private gentlemen, merchants, tradesmen, and artizans—all meeting on a common level, and engaged in the same spirit-stirring pursuit; for in curling

there is no aristocracy of feeling, and so, for the time, a universal saturnalia prevails. The game of curling is eulogised by more than one Scottish poet, particularly by Grahame, who thus commences a description of the sport:—

"Now rival parishes, and shrievedoms, keep,
On upland lochs, the long-expected tryst,
To play their yearly bonspiel. Aged men,
Smit with the eagerness of youth, are there,
While love of conquests lights their beamless eyes,
New-nerves their arms, and makes them young once more."

In Mr M'Diarmid's "Sketches of Nature," we find the following spirited account of this delightful winter game:—

"The time is not distant when the game of curling was little known out of Scotland, or even within it, benorth the Forth. But the taste for this manly sport has increased greatly of late years; and in various parts of England, as well as of America, the broom and the channel-stone are put in requisition with the same regularity that winter comes round. In the course of last year, several hundred pairs of stones were exported to Canada; and it may be worthy of remark, that the best material for the manufacture of these is found at Ailsa Crag—one of the most remarkable rocks in the world—and particularly on the side of it facing Girvan. To fashion and balance the stones properly requires a very good workman, and the few that are known to excel in the art have great reason to be satisfied with their earnings.

In the whole range of rural sports, I know nothing more exhilarating than a *spiel* on the ice, where the players are numerous and well matched—the stakes a dinner of beef and greens—and the forfeit the honour of rival parishes. Whether we mingle with the eager throng, or perambulate the banks of the frozen lake, on the principle that 'distance lends enchantment to the view,' the scene abounds with points of interest, that might well afford scope for the pencil of a Wilkie, or the pen of a Scott. First, we have the icy arena itself, scooped at the bottom of some quiet vale, fringed with reeds, from which the wild duck rises whirring on the wing, and skirted with alders, whose beautifully feathered and fantastic tops seem even more engaging than when nursed into foliage by the beams of May. All around is blank and dreary—the snowflake freezes as fast as it falls—the sun seems level with the horizon's verge—the hills make the spectator cold to look at them—and every thing, in one word, conspires to complete the picture of a winter's day. But the courage of men bent on the favourite amusement of curling is not easily damped by the inclemency of the elements; on the contrary, their spirits seem to mount as the thermometer falls, and nothing pleases them more than a feeding storm, and, along with that, the prospect of a long lease of 'their roaring play.' Arrived at the scene of action, all is bustle and animation, till the stones have been distributed, assorted, claimed—rinks measured, tramps fastened, tees fixed, and the order of battle completely arranged; and as these preliminaries are speedily settled, to it the parties set with all the anxiety of those who contend for a much higher prize. Lots, perhaps, are cast for the first shot, and the greatest novice invited to deliver the first stone; and should his arm lack the proper pith, that instant a dozen brooms are raised to help the laggard over the *hogg score*. A second, a third, a fourth succeeds, and so on, till the line stretches a tolerable length, though not by any means to the 'crack of doom;' and each man is warned by his respective friends to plant, if possible, an excellent guard—dislodge this stone and cover that—open up one port, and close another—play soft or strong, outside or inside, as the occasion may require—and steer as closely by the signal broom, as the mariner, when warned by similar devices, threads his watery way through sand-banks and shallows.

As the animating sport deepens, it is amusing to contrast the bustle that obtains in one little spot with the stillness that broods over the external world; while the hills above are silent and dark, the shining lake below is instinct with life, and resounds with sounds of mirth and glee, which, borne along on the elastic air, invade the solemn loneliness that reigns around, till echo itself takes up the tale, and repeats in broken fragments the curler's vocabulary. At length, as the more veteran players advance to decide by their skill the fate of the *side*, the interest becomes intense, and gives rise to so many calculations of what is to be done and what avoided, such bustling to and fro, as must appear a perfect mystery to the uninitiated. The last wary shot booms athwart the ice as if impelled by magic, and while every port, to an onlooker, seems closed, finds its way under the guidance of a powerful arm and steady eye, through passages rivalling the intricacy of the walls of Troy. Then follow the shout of victory and the murmur of defeat, till the contest is renewed under the mingled emotions of hope and fear—the vanquished trusting that the tables will be turned, and the conquerors confident they will remain the same. At this stage of the business, which may be aptly enough described as act the first of the curling drama, rations of bread and cheese are handed round—appliances which custom renders needful; and when the combatants, while flapping their benumbed hands, feel their stomachs warmed and their strength recruited, to work again they set with fresh vigour, the one party bent on recovering the ground they unfortunately lost, and the other determined to retain the laurels they have already won. In a trice the eager players are marshalled, and the broom put in requisition as before; again, the stones boom away and away, meandering here, meeting there, and whirling from the cold ice like the urchin's top at school; again shot succeeds shot, and port follows port, until the conclusion of the *hog-pool*, or the approach of evening proclaims that it is time the sport should surcease, and the combatants wend their way to the nearest *clachan*, to enjoy their favourite feast of beef and greens. And now the scene changes entirely, though, as the savoury viands load the board, all feel the effects of the keen mountain air, and make so good a use of their time while the opportunity serves, that the business of eating becomes nearly as noisy as the business of play; rounds of corn-beef, flaggons of home-brewed, disappear with a rapidity that is truly astonishing, and of which no adequate conception can be formed by persons whose appetites were never whetted by a day on the ice.

Previous to the discovery of Professor Leslie, there are few, I suspect, who would have credited the possibility of ice being generated in a common room, heated to the temperature of 65 deg., by means of an apparatus so simple and portable, that the spectator sees unfolded, step by step, the beautiful process of crystallization, from the first projection of a series of spikes (hardly more tangible than the tiny cable with which the moor spider moors his web to a tuft of heather), till the gradual consolidation of the watery surface. Who, within the last twelve months, could have supposed it possible that curling could be conducted on scientific principles, by economising not caloric but cold, or rather turning it to the best account. Yet the thing has been done, and the lovers of that ancient sport, by submitting to a very trifling expense, may in some measure render themselves independent of the elements. The merit of this discovery belongs to Mr John Carnie of Largs, who three years ago succeeded in forming a curling rink weeks before the ice would bear in any other quarter, within eighty yards of the sea-coast, and so near the smoke of his own kitchen, that he could tell, by casting his eyes in the proper direction, every time the cook mended the fire. A circumstance so novel was not only bruited abroad in Ayrshire, but even reached the town of Dumfries, and was shortly noticed in one of the journals of that town.

In forming an artificial curling rink, the first thing to be done is to select a suitable piece of ground, levelling and freeing it from grass and weeds; the bottom must then be lined with clay, to prevent any material absorption of water. A little lime mixed with the clay has the effect of killing and checking the mining operations of worms; and in the absence of lime, a small quantity of coal-tar spread on the surface will serve the very same purpose. The walls, so to speak, of the rink, and which need not be above five inches in height, are formed in the same manner as the bottom, with this exception, that the clay is sloped and covered with a thick layer of turf, to prevent the sides and ends from being broken. The rink originally formed by Mr Carnie is 44 yards long by 7 yards broad; but if he had the work to do over again, he would enlarge its dimensions to 60 yards by 11. The additional space would afford scope for two rinks, and the ice, however thin, is found so true and keen, that the player requires 'room and verge enough.' Little more than a hundred carts of clay completed the pond formed at Largs, and this was the principal item of expense. Now, in ordinary circumstances, a few neighbouring heritors or farmers, by sending their carts to the clay hole in the morning, might have a pond ready to curl on at night. Farm-servants in winter are often half idle, and the whole outlay in such a case would be a few bottles of whisky to the men. And the pond or rink once formed, nothing is more easy than to cover with water. To produce ice to the thickness, let us say, of a quarter of an inch, on such an area as is described above, about five hundred gallons of water will suffice; but where haste is required, the fourth part of the quantity will be found sufficient, and may be applied by two men in the course of an hour, who of course find it no great hardship to walk backward and forward, and sprinkle the surface with the roses of watering-pans. The water freezes as fast as it falls, and many coatings of ice will be formed before the men have completed their task, and within the time just specified. Where the water is deep, and the resistance slight, successive nights of frost must occur before the curler dare trust himself on the icy platform; but for this Mr Carnie has discovered a remedy. As the bottom of his pond is firm and hard, it becomes, as it were, a *table of ice*, and that too when the thermometer merely oscillates at the freezing point; and I can compare his operations to nothing more apt than a gilder silverising a huge mirror or plate of glass. The thought was happy—the idea most ingenious; and in all probability, before many years elapse, rinks similar to the one at Largs will be formed in every district where curling is known. During many seasons we have no abiding frost; in others almost none at all; and even under the most favourable circumstances, a company of curlers must often ascend hills and traverse moors in search of a proper arena for their favourite spot. Thanks, therefore, to the man who has taught us to scoop a curling rink with the same certainty that we level a bowling green, and obviated all the accidents of drowning and drenching that sometimes occur on those lochs which are as deep in the middle, if not at the sides, as the hills around them are savage and high.

During the summer or autumn of the present year, Mr Carnie improved his curling rink greatly. After two years' experience, he found an objection arising from weeds and worms; and to obviate this, he employed workmen to stick a number of small stones into the clay; over these a roller was drawn repeatedly, and the mass, when thus consolidated, became nearly as firm and hard as a road thoroughly macadamised. Not contented with this, he spread a mixture of lime and sand over the clay to the depth of an inch and a half or more, levelling the surface with the roller as before; and if a barrel or two of Roman cement were superadded, or even used as a substitute for the sand, the inventor is of opinion that the pond would remain perfect for many years without requiring the slightest repair. But for ordinary purposes, a mass of well-levelled clay, sprinkled with lime, with sides and ends a few inches high, is quite sufficient; and though it may suffer from worms and the vicissitudes of weather, a very little care will put every thing to rights on the recurrence of winter. To prevent the ice from being cut up with tramps, Mr Carnie places at the ends of the rinks moveable pieces of sheet iron, frosted both below and above, and by means of this simple device the curler obtains an excellent rest for his feet, and stands not only firm, but *low*. Tramps elevate the player too much, and every body knows that the nearer the curler stands to the ice, he is the more likely to make his shot effectual. Independently of this, the tramps disfigure the ice by throwing up dirt, and are now dispensed with where curling is practised on the most approved principles."

WESTERN STATES OF AMERICA.

OHIO.

Leaving Western Pennsylvania, with its hilly regions, its coal and iron mines, and its flourishing town of Pittsburg, the next district which comes under the notice of the emigrant is that of Ohio. The length of this state is 210 miles, and its mean breadth 200, and altogether containing 25,000,000 of acres, with a population which in 1830 amounted to nearly 940,000. It is bounded on the north by the territory of Michigan, and Lake Erie (which separates it from Upper Canada); on the east by Pennsylvania; on the south-east by Virginia, from which it is separated by the Ohio river; on the south also by the Ohio river, which separates it from Virginia and Kentucky; and on the west it has Indiana.

There is probably nowhere in the world a body of land of the same extent of which a greater proportion is susceptible of cultivation. It may be considered a surface of table or high flat land sloping in one direction towards the Ohio, and in the other towards Lake Erie. The northern belt has great tracts of wet and marshy soil. They are, however, excellent, and in positions that render them easy to be drained. They are covered with forests, and, when cleared and drained, will not make the least valuable part of the state. There are extensive bodies of land heavily timbered, in a state of nature, which are as level as prairies. The most fertile part of the state is between the two Miamies. On the upper courses of these rivers, and on the Muskingam and Scioto rivers, are rich and extensive prairies, a great proportion of which is susceptible of cultivation. On the whole wide surface of the state there is scarcely any land so hilly, sterile, or marshy, as, with moderate labour, may not be subdued and cultivated. The whole region seems to have invited a hardy and numerous body of freeholders to select themselves moderate and nearly equal-sized farms, and to intersperse them over the surface. There are vast tracts of the country of an alluvial nature, and therefore of a rich quality. The soil generally is very productive. To be able to judge of the extent and power of vegetation, one must reside in the state through the summer, and observe with what luxuriance and rapidity the vegetable creation is pushed on; how rapidly the vines, grain, and fruits grow; and what a depth of verdure the forests assume. Indian corn is the staple of the grains, and is nowhere raised more easily or in greater abundance. On rich alluvial soils 110 bushels have been produced from an acre, though fifty may be considered an average crop. The state generally has a fine soil for wheat. Rye, barley, oats, buckwheat, and all the grains, are raised in great abundance and perfection. Melons, squashes, pumpkins, potatoes, and all kinds of kitchen vegetables, are raised in great perfection. Apples and most kinds of fruits, as peaches, cherries, gooseberries, and grapes, can be produced in abundance. From the fulness and richness of the clusters of cultivated grapes, it is clear that this ought to be a country of vineyards. The gardens are among the finest in America, but agricultural improvement still proceeds at a slow pace.

The Ohio state lies between the 38th and 41st degree of north latitude, and its climate corresponds to this genial situation, except where modified by local peculiarities. The climate along the immediate valley of the Ohio is more equable and temperate than in the middle and table lands of the state. The mean temperature generally is found to be 53° of the thermometer. The prevalent and warm winds are those that blow up the valley of the Mississippi. The northern breezes come charged with the cold of Canada and the lakes. In that part of the state that slopes to the south, the snow neither falls deep nor lies long, but in the district that slopes towards the lakes, there are deep and durable snows, and sleighing and sledding are practicable for a considerable length of time. It is a great inconvenience in this climate that the transitions from cold to heat, and heat to cold, are frequent and violent. Yet winter is oftentimes mild, and can scarcely be said to be more than a prolongation of autumn. The summers are usually hot, but the autumns are almost uniformly temperate, dry, and beautiful, and they cannot be exceeded for health and pleasantness. Nowhere in the world is the grand autumnal painting of the forests, in the decay of vegetation, seen in more beauty than in the beech forests of Ohio. The richness of the fading colours, and the effects of the mingling hues, baffle all description. A great farming

community, like that of Ohio, could scarcely desire a better climate for themselves, their cattle, and stock of all kinds, or one in which a man can work abroad with comfort a greater number of days in the year.

This state derives its name from the noble and beautiful river Ohio, which bounds it on its eastern confines. In a former article, we mentioned that the Ohio river was formed by the junction of the Alleghany and Monongahela at Pittsburg. The Alleghany, which rises in the state of Pennsylvania, is the most important tributary of the Ohio. It has a swift sweeping current, and often a rocky bottom, and is considered to be dangerous in its navigation. Monongahela rises in Virginia, and flows in a north-west direction to Pittsburg, where it is more than four hundred yards wide. It traverses a rich and well-settled country, noted for its whisky, flour, iron, and manufactures. The banks are often bold and high bluffs, and in some places the country is hilly. In good stages of the water, it is navigable by large boats a hundred miles from its mouth. There are few more rural, picturesque, and delightful tracts of country in the United States, than that on this river. The Ohio, at the union of these streams, is above six hundred yards wide, or about a third wider than the Thames at its broadest part in London. From its commencement, the Ohio affords most delightful prospects, and, at the distance of every few miles, rivers of a romantic and beautiful character flow into it as lateral canals. The lands on its margin are of extraordinary fertility, generally high and dry, and for the most part healthy, while the configuration of the country around has all that grandeur, softness, or variety, in such combinations as to destroy a monotonous effect. For thirty miles below Pittsburg, its course is north-west. It then slowly turns to the west-south-west, and pursues that general direction five hundred miles—thence south-west a hundred and seventy miles—thence westward two hundred and eighty miles—thence south-west a hundred and seventy miles, through a low and swampy country, to its junction with the Mississippi. Between Pittsburg and its mouth it is diversified with a hundred considerable islands, some of which are of exquisite beauty, and afford most lovely situations for retired farms. With respect to the rapidity of the current of the Ohio, it is found, according to the different stages of the water, to vary between one and three miles an hour. In the lowest stages of the water, in autumn, a floating substance would probably not advance a mile in the hour. The river is liable to extreme elevations and depressions. The average range between high and low water is fifty feet. Its lowest stage is in September, and its highest in March. But it is subject to sudden and very considerable rises through the year, and has been known to rise twelve feet in a night. When these sudden elevations take place, at the breaking up of the ice a scene of desolation sometimes occurs, and boats and every thing in its course are carried away by the accumulated power of the ice and water. The smallness of the declivity of this river is remarkable. At Cincinnati, a town on its banks, immediately to be noticed, the surface of the river at low water is supposed to be no more than a hundred and thirty feet below the level of Lake Erie, and four hundred and thirty above that of the tide water of the Atlantic.

Some of the other rivers in the state of Ohio are considerable. The following are the most important: the Muskingam, Great Keuhawa, Scioto, Great Miami, Kentucky, Wabash, Cumberland, and Tennessee, all of which are navigable in moderate or high stages of their waters, for considerable distances. The Little Miami, another stream in the state, is not of much importance for navigation; but from the fertility of the lands on its borders, and its numerous mill-seats, it is a river of great utility. There are nearly fifty mills upon it; some of them mills for the manufacture of paper. The country between the Great and Little Miami is generally finely watered, healthy, pleasant, and fertile, and may be considered the garden of the state. The Ohio is the general recipient of these important rivers, and points on their banks may be reached by the steam and other boats departing from Pittsburg and Cincinnati.

The state of Ohio, more populous than the others in the west, has taken precedence of all the rest in manufactures. Cotton yarn, cloth, and woollen goods, are already manufactured to a considerable extent; Cincinnati being the principal seat of this spirit of industry, but Steubenville, Zanesville, Chillicothe, Dayton, and many other rising and promising towns commencing in a similar career of prosperity. Wheeling, a flourishing town, within the limits of Virginia state, is situated on the left bank of the Ohio below Steubenville. Cincinnati, which the emigrant will most likely find occasion to visit, for the furtherance of his views either as to agriculture or trade, is situated on the north shore of the Ohio, in the south-west angle of the state, of which it is the chief town. Its position is a beautiful vale of twelve miles in circumference, created by an elliptical sweep of the Ohio hills. Those of them that have not been laid bare by the axe are beautifully wooded to their summits; and, by the swell and indentation of their waving outline, present the most graceful and charming forms. From the summit of any of these hills, the town spreads a panoramic map of exquisite painting. The eye traces every street, with its smokes, fixtures, and moving life, from which all the roughness of inception, softened by distance, disappears. The noble establishments, the handsome mansions, the extending masses of buildings, the numerous manufactures propelling their columns of black smoke aloft, the boat-yards, the bustling inhabitants with the hundred teams and drays, the Ohio wending along the southern limit, and itself enlivened by passing crafts and stately steam-boats rounding to the shore, or departing from it, the villages of Newport and Covington with their showy houses and manufactures on the Kentucky bank of the Ohio, taken together, offer such a picture of beauty, wealth, progress, and fresh advance, as few landscapes in any country can surpass.

A more eligible position for a town can scarcely be imagined. The chief area consists of two parallel plains, the one elevated sixty feet above the other, and descending to it by a gentle and graduated slope, affording admirable facilities for washing the town by every considerable rain, and sloping it to the eye in the graceful form of an amphitheatre, and at the same time furnishing it with every pleasing variety of sites for building. Seven of the streets are sixty-six feet wide, and 396 apart, intersected by streets of the same width and distance at right angles. One entire square, and the fraction of another, are reserved in central parts of the city for public buildings. The city buildings cover an irregular area nearest the form of a parallelogram. The central parts are compactly built with houses and stores, that would ornament any town.

There are many excellent stores on Fort and Main Streets, and the eye is arrested by many beautiful private habitations. Architectural taste is daily becoming more enlightened and agreeable. The dull red of the brick walls is giving way to more pleasing shades between white and green; and a beautiful stucco, imitating marble and granite, is getting into fashion. The number of substantial buildings added annually to the city for three years past, averages 450. Cincinnati has already become a great manufacturing town, and is constantly becoming more so. Our limits preclude details; but all the substantial manufactures known in America are carried on to a greater or less extent. The manufactures in iron are very great, particularly in the article of heavy castings, and all sorts of machinery driven by steam. Of such establishments there are nine or ten, and some of them on a great scale. The next most extensive article is cabinet-work. Steam-boat building, and the making of hats, are also pursued to a great extent. It is believed that the city contains at least forty different manufacturing establishments driven by steam power. Being the importing and exporting depôt for more than a million of inhabitants, this city transacts an immense business, particularly in the retailing and manufacturing line. The imports, in which dry goods are the principal item, exceed five millions of dollars. The amount of exports, consisting of the various articles of produce, of which pork is the chief, and of manufactures, of which iron articles and cabinet-furniture are the chief, probably exceed the imports. No town of its size in the United States produces a more respectable show of all the different classes of mechanics, arranged under their respective standards, on the 4th of July, the anniversary of American independence. One hundred and eleven steam-boats have been built here, at the rate of about fifteen every year for the last three years. The city revenue of 1831 amounted to 35,231 dollars, and the expenditure 33,858.

In Cincinnati there are two banks, a savings bank, several native insurance companies, many associations of different kinds, and a great number of excellent schools. The town publishes three daily, two twice a-week, and six weekly newspapers, of which four are religious. There are also various of the larger description of periodicals. Although first established in 1789, this town did not properly commence till 1808, since which period its increase has been regular and rapid: in 1813, it had a population of only 4000; and at present it numbers about 30,000 inhabitants, composed of emigrants from most parts of the Union, and from European countries, especially Great Britain. By the course of the river, Cincinnati is situated 455 miles from Pittsburg, and 405 from the Mississippi. From New Orleans it is 860 miles, from St Louis on the Mississippi 350 miles, and from New York, by way of the Erie and New York canal (the route by which emigrants from this country ought to proceed) 850 miles.

The state of Ohio has a number of other towns rising into importance, either from their situation, or trading and manufacturing capabilities. Columbus is the capital of the state, and stands at very nearly the centre of it, on the east bank of the Scioto river. Steubenville, on the west bank of the Ohio, thirty-eight miles north-west from Pittsburg, is yearly increasing. It is surrounded by a rich and populous country, and contains three churches, an academy, a woollen factory, a steam paper-mill, a flour-mill, and cotton-factory; besides two printing offices, two banks, twenty-seven mercantile stores, sixteen public inns, and various useful establishments. It now contains about 3000 inhabitants. Zanesville, situated on the east bank of the Muskingam, also possesses various manufacturing establishments. Chillicothe, on the Scioto, is another neat town of a similar character. Marietta, Lancaster, Galliopolis, Portsmouth, Circleville, Dayton, Lebanon, and Sandusky, on Lake Erie, with many other towns of lesser note, are likewise gradually and steadily advancing in size and prosperity. The banks of the Ohio, says our authority, are destined shortly to become a continued village.

The state is now greatly improved by its system of canals. The grand canal, connecting Lake Erie and the Ohio, passes nearly through the centre of the state, from Cleaveland on the lake, to Portsmouth on the Ohio, a distance of 306 miles. Many lateral canals are also constructed, and others are in progress. The wonderful work of uniting the Canadian lakes with the Ohio, and consequently the Mississippi, and Gulf of Mexico, has imparted a new aspect to the country through which it passes, and has in many places quadrupled the land in value. In whatever aspect we contemplate the extensive state of Ohio, the mind is affected with surprise and pleasure. The history of colonies affords no similar example of a settlement of equal numbers, improvement, and prosperity, so rapidly springing from a solid forest wilderness, with no adventitious aid, no forcing or patronage; nothing except the fertility of the land, the freedom of the institutions, and the enterprising character of the American people.*

ALGIERS.

Algiers, a Mahommedan country on the north of Africa, was long notorious as a piratical state. For almost two hundred years, its government afforded the shelter of its port and flag to the robbers of all nations who chose to make that the depositary of their plunder. It was repeatedly chastised, its fleets destroyed, and its town burnt to the ground, by the European nations who smarted under the annoyance of its petty system of sea-robbery; yet the government recurred always to its former practices, and gave encouragement to every adventurer or renegade who could bring capital sufficient to fit out a new pirate ship, and was able to find a crew of desperadoes to man her. This system was begun in the early part of the sixteenth century, when Algiers, being threatened with subjugation by Spain, was forced to call to her assistance a famous pirate of those days, called Barbarossa. This man defeated the Spaniards, but soon afterwards murdered the prince who had invited his aid, and occupied the throne of Algiers in his place. He extended his dominions in Africa, and made the flag of Algiers an ensign of war and piracy against all Christian nations. His brother Hayraddin, who succeeded him, fortified the town in a strong manner, in which work he employed 30,000 Christian slaves.

The loss caused to the trade of the Mediterranean by these pirates was so great, that Charles the Fifth fitted out an expedition of 30,000 men, with 140 ships, against them (1541). The whole armament was, however, destroyed or broken up by a storm almost immediately on landing, and the Algerines escaped without harm. The next attempt to put them down was by the French in 1617, who sent Admiral Beaulieu with a fleet of fifty sail against the place: he was able, however, to effect nothing decisive. The same result happened to the English under Admiral Mansel, in 1620. The Venetian commander Capello, and the French under Du Quesne (1682), gave them severe lessons, and almost annihilated their marine, but were not able to prevent their resuming their depredations as soon as they could again collect arms and ships. In latter times the expedition of Lord Exmouth, who reduced the town and its fleets to ashes, must be fresh in every one's recollection. Still they were not to be tamed; in truth, the place subsisted only by plunder, and had no prospect of trade or profits without it; it was, moreover, a convenient resort for unprincipled men from all quarters, who wished to carry on the practice of piracy. When one swarm of vermin was destroyed, another immediately occupied a place so well fitted for their purposes, and where they were received with open arms by the authorities.

These circumstances at last determined the powers of Europe to adopt a new course, which it was left to France to put in operation. This power fitted out an armament in 1829, not only to chastise the Algerine government, but to take permanent possession of the country and of the port, which had so long been a den of robbers. This expedition consisted of 37,639 men, with the requisite cavalry and artillery. The number of vessels altogether was 644. The commander, Marshal Bourmont, conducted his system of attack with great prudence, and gave France possession of Algiers with very slight loss. The captive dey, or sovereign, was sent to Europe, where he lives on an allowance as a private individual, in some part of Italy—(it is said he is now going to Alexandria). The expenses of this expedition were amply repaid to France by the public treasures of gold and silver which were found (amounting to about two millions of pounds sterling); besides L.300,000 of stores. She was left mistress of the finest district of Northern Africa, and had besides the satisfaction of breaking up thoroughly a nest of pirates, who had kept the Mediterranean seas under contribution for nearly two centuries.

The country which France has thus occupied is bounded on the north by the Mediterranean, and on the south by a range of elevated ground, called the mountains of Atlas; it has the state of Tunis on the east,

* Collected and arranged from the works of Timothy Flint.

and the empire of Morocco on the west, and is about 675 miles long by 150 broad; the arable ground which it contains is reckoned at 6300 square leagues. There are a number of small rivers, which take their rise in the mountains to the south, and water the whole breadth of the country in their way to the sea, so that there is every facility for increasing the productiveness of the land by irrigation. The soil is naturally fertile, and yields many of the fruits and other productions of the West Indies, besides several which cannot be cultivated there. The carob-tree,* the date-tree, and the olive, are natural to the soil; the vine thrives on the hills, and decorates the plantations of the flat country, its trunk growing frequently to the size of the pear-tree; lemons, oranges, citrons, and pomegranates, are found in superabundance, and of the finest flavour. The Barbary indigo plant, the Suleiman sugar-cane, the nessri or white rose, the flowers of which produce the famous otto of roses, in quantity double those of Europe; these are all of a quality peculiar to the country, and might greatly increase its commercial riches. The grains most commonly cultivated are wheat and barley; oats do not thrive, but maize, doura, rice, and peas, produce excellent crops. The sea-shores abound in superior qualities of coral, which, with ordinary skill and industry, might be converted into a mine of wealth. The chief riches of the tribes who live in the interior of the country consist in flocks and herds; and every province being full of pastures of the most extensive description, they possess all kinds of domestic animals; horses, oxen, camels, mules, cattle, goats, &c. The apes are particularly large, docile, and beautiful; the Barbary horse is little inferior to the Arabian; horned cattle, however, are small in size, and the cow yields no milk when her calf is removed. Algiers and Morocco are the native countries of the famous Merino sheep, besides which, they have another breed like that of the Cape of Good Hope, with large tails, composed entirely of fat.

Such are the natural capabilities of this region, but the riches of a country depend more on the industry of the people, and the good qualities of the government, than on the bounties of nature; and accordingly we find that Algiers, with all her blessings of soil and climate, has a population as poor and wild as any on the surface of the globe. There was not in the whole country, when the French occupied it, a road practicable for any kind of cart or carriage, and only mere paths for horses or beasts of burden. A fourth part of the population are without settled places of abode; the implements of labour in use among those who cultivate the fields are ill-contrived, unfit for their purposes, and worth nothing; every thing is to be done by main strength, without aid from tools or machinery. The wages of a working man are about twopence farthing per day, and his miserable hut, food, clothing, and working-tools, are such as he can procure from that pittance.

When the French first obtained possession of the country, their design was to convert it into a colonial settlement, and to introduce French cultivators with habits of European industry, and more efficient modes of labour. They accordingly brought over a number of settlers both from France and from Rhenish Bavaria, established a *ferme modèle*, or pattern farm, and gave every encouragement to colonists who had either skill or a little capital. It was soon found, however, that there were difficulties in the way of carrying this plan into effect, which had not been anticipated. In the first place, the French had calculated on taking possession of all the lands held by the Mahommedan religious establishments, and which were considered as public property, but it was soon found that the greater part of these were only nominally in possession of the church (if the *mosque* may be so called), having been merely conveyed in a certain form to the priests, in order to remain under their protection for the use of the actual owner or his heirs, in case of any attempt at confiscation by the government. The priests were in fact only trustees for others. This narrowed greatly the choice of lands which it was intended to bestow on the new colonists. In the next place, the settlers themselves, being generally poor people, were without means of procuring effectual shelter from the heat or dews, and accordingly numbers of them fell victims to the change of climate. Their manner of living was, besides, much more expensive, and required much higher wages to maintain them in health, and in working condition, than that of the natives of the country. There was an additional reason, we believe, which must always prevent French colonies of this kind from being successful, that France has neither capital nor skill to throw away on such enterprises. All the people who have either stock for carrying on business, or skill for any useful trade, are wanted at home by the necessities of their own country, and have no temptation to emigrate.

These causes, and perhaps others, have now determined the French to give up their original idea of colonising the country, and of introducing European modes of agriculture. Their *pattern farm*, with its *offices*, has been abandoned, and the colonists have been sent home to France. The object now is, by establishing a regular and steady form of government, to give confidence and alacrity to the industry of the natives themselves, and to lead them to improvement, by the prospect of securely enjoying the fruits of their own labour. Roads are in progress for this purpose between some of the principal towns, and every means are taken to prevent the incursions of those demi-savage and hostile tribes who have been accustomed to harass the country from their fastnesses in the mountains.

The people who are thus to be managed, consist of several distinct races. The most numerous are those called the Moors, and who, though altogether a mixed race, are the oldest tribe of civilised inhabitants: they are the farmers, labourers, tradesmen, and even merchants of the country. The next are the independent, or unsettled Arabs, who have great numbers of flocks and herds, and remain within certain recognised districts, but are chiefly without fixed dwellings. Some of these people have maintained a kind of war against the French ever since the conquest of their country, and it is only of late that they have been dislodged from Bougeia, a stronghold which had long been occupied by them on the coast. The next tribe is Kabylies, or inhabitants of Mount Atlas, who are far removed from the sea-coast, and are a rude, though hardly savage race of mountaineers: they are cultivators, and have fixed dwellings, sometimes even pretty large villages, among the hills. They have hitherto been extremely inimical to the French, and given them much annoyance. This hostility is instigated by some partisans of the former government, and is the more to be lamented, that the French are anxious to conciliate them, considering them as one of the oldest and most original races of Northern Africa: they are in truth the descendants of the ancient Numidians. Their language is spoken with slight variation through an immense extent of alpine country, almost from Cape Nun to the Oasis of Siwah; and several missionaries have already put themselves in the way of acquiring it, in order, by that means, to introduce religious knowledge, and the germs of regular industry, among a people hitherto neglected. A few of them near the coast profess the Mahommedan faith, but in their remote villages, among the mountains, the only religion is paganism.

Besides these, which are the most numerous races, there are Jews, Turks, and Kolouglis. The Turks and Kolouglis are chiefly people connected with the old system of government. The Jews, who have here seventeen synagogues, are petty dealers, brokers, money-changers, and merchants, as they are found in all parts of the world.

The following enumeration of the different tribes is given on the faith of the French "Journal des Sciences Militaires":—

Moors and settled Arabs	1,200,000
Independent Arabs	400,000
Kabylies or Berbers	200,000
Jews	30,000
Turks and Christian renegades	20,000
Kolouglis, or descendants of Turks	20,000
	1,870,000
European population, June 1832—	
French settlers, merchants, &c.	1,927
English subjects (chiefly Maltese)	421
Spaniards	1,052
Sardinians, Germans, Italians	621
	1,874,021

The same amount of population is stated by M. Gravery de Henesro, the Swedish consul; but the numbers of the several classes are with him very different: the reason of which no doubt is, that the distinctions betwixt the classes are not very obvious, and in some cases cannot be at all recognised. He reckons, however, 70,000 negroes, whom it is rather surprising not to find in the French account.

The agriculture of the country, though all its implements are of the most miserable kind, is conducted on very good principles; which is not surprising, when we consider that it was the Moors, the inhabitants of this very country, who introduced all those agricultural improvements into Spain, which long made Andalusia the richest and best cultivated district of that now mismanaged country. The irrigation of land is well understood, and the works in different parts of the states of Algiers for that purpose are worthy of imitation. Yet the small extent to which cultivation is carried, from the defects of the former government, the want of roads for carrying grain to market, &c. renders it necessary to import both corn for the people, and even hay for the use of the French cavalry.

There can hardly be said to be such a thing as foreign commerce. The exports in 1831 consisted only of old metal, chiefly copper and iron; a little olive oil; with a trifling quantity of leather, wool, and wax. The coral fishery furnishes a slight addition to the exports.

The French are doing something to introduce a taste for mental culture, and a knowledge of the arts. They have established a "Colonial Society," for attending to the interests of agriculture and commerce; and which proposes to publish an annual account of the state of Algiers, of which the number for 1832 has already appeared. There is another scheme, which, in the present state of things, could have occurred to none but Frenchmen: this is the "Philharmonic Society," composed of a number of young officers, who propose to civilise the Algerines by inspiring them with a taste for the opera and the music of Rossini. Odd as this idea may appear, if the habit of meeting for public amusement, and a taste for pleasures not entirely sensual, can be produced by it, it will not be without beneficial effects. In the matter of general education, we believe nothing has been done. The only schools established by the French are, two for the children of their own people, and a boarding-school for young women.

The education of the Mahommedan schools is exceedingly imperfect, the children being only taught to read, and to repeat sentences from the Arabic Koran (which is not their own language), with a little arithmetic.

The public income of Algiers under the French has been published, by which it appears that the expenses of the French in retaining Algiers amount to L.928,285, whereas the income is only L.44,558. In this situation of affairs, it can only be the prospect of future advantage, or (which we believe is greatly the case) a feeling of national pride, which induces them to retain possession.*

* In Spain the fruit of this tree is called "St John's bread,' and is supposed to have been the food of John the Baptist in the wilderness, though our version of the Bible translates it "wild locusts."

* The greater part of our materials for the above notice have been furnished by a French work, called "France Pittoresque," which is at present publishing in Paris. It appears in cheap weekly numbers, on the plan of which Chambers's Journal furnished the first example; but which is now extensively acted on in Berlin, Paris, and other well-informed capitals of the Continent.

LETTER FROM CANADA TO THE ETTRICK SHEPHERD.

THE following extract from a letter from Dr D——, a Scottish medical practitioner in Upper Canada, to his friend Mr James Hogg, has been put into our hands for publication by the Shepherd himself, though we must confess, the *facts* which are mentioned are perhaps *too strongly* drawn to meet with *perfect credence*, and may be shrewdly suspected as a satire on the extravagant desire for dissection which animates the modern school of surgery:—

"Goderich, Upper Canada, July 12, 1833.

* * * *

But why should you doubt my word about the resuscitation of those corpses which I wrote you about? You have written and published so many falsehoods yourself, that, when one tells you a wonderful story, you immediately suspect him to be one like yourself. I have always noted, that when you spoke you told the truth, sometimes a little exaggerated; but whenever you put your pen to paper there is no more hold to be had of you. With me it is quite the reverse. If you believe all that I say, I would not advise every body to believe you; but when I write, I always relate the straightforward truth, as you will perceive before finishing this letter. Now, you must know that since ever I left Edinburgh, and my two glorious associates L—— and S—— (we three having performed such feats together), I have been very fond of dissection, and, since I came here, have plied the whittle to some purpose, and have made some curious discoveries both in anatomy and pathology, for the Indians are not formed like us: but these things are above your capacity: so to return to my narrative.

I think it was either in the winter of 1825 or 1826, that there was the body of a man found buried in the snow, and frozen to death; and as no one knew who he was, or to whom he belonged, so there were two Canadians brought him to me, and I gave them a guinea for him. The body was such a complete icicle, that I could not distinguish whether he was a white man or a native Indian; and I had to put him before a great fire for three days and three nights before he was fit for dissection. On the fourth, I found him lithe and limber, quite warm, and in capital condition; so I put on my jacket and apron, laid him upon the board, and began by making a gentle incision with my knife, when I was rather astonished at seeing, as I thought, the appearance of some dark red blood oozing from the wound like small drops of dew. I touched it with my palm, and imagined I felt it warm; but thinking it could only be from the heat of the fire, I gave another slash, when behold my subject began a-writhing and muttering in a weak tremulous voice. I was thunderstruck, but had so much recollection left as to hold the wound firm with my hand, and ring the bell. The fellow opened his eyes, and looking me in the face with a drumbly stare, called, "Och, mhurder! what is it that you'll be after doing to me, mauster? Is it my life that you wants?"

I at once knew him to be an Irishman, though he was so dark of complexion: I had taken him for a Canadian all the while. "Why, my dear fellow," said I, "you were brought into me the other day dead, and frozen to an icicle, and I was only trying a little operation to bring you to life again, which I am happy to have effected."

"Was it daid that I was?" said he, in perfect good humour. "I thought I had bin only taking a slaip to myself. And true for me so I was, as Quinkum the shooter will tell you; for he was with me when I lay down in the snow to take a slaip. But is it the cutting up of the top of a man's belly, and taking out of his moniplies, that brings him to life? That is cirtainly a faisable plan."

I then sewed up the wound I had made, put a plaster on it, and bandaged it up; and my friend called for something to drink, and grew quite communicative. I asked him who he was, what he was, and how he was engaged when he lost himself among the snow.

"A man cannot be said to be lost who is found agin," said he. "Every man is not after being lost who lies down to take a slaip. But I must have been walking in my slaip, else how came I here? As for the rist, my name is Barney O'Towl, commonly called Black Barney; and was sint by my mauster all the way from Fair River with a litter to Mr Thomson; but havin' nothin' to drink, I fell down with fatigue and sleep yesterday, and here I am. The prime of the day and of health to you, mauster; but I cannot help laughin' when I think of your operation for raising the daid."

Barney never ailed any thing more, for I took very good care of him; but I never could persuade him that he was at all dead or in a torpid state. He cut open the lining of his vest, and showed me the letter, when, to my utter astonishment, I perceived that it was addressed to a friend of mine, Mr Thomson, surveyor. "Why, dear Barney," said I, "Mr Thomson left this country very nearly three years ago. You have slept in that snow-wreath three years."

"And, indeed, it wis a very fair refreshment of the sort," said Barney; "I fear I shall scarcely be able to make up the balance by three years' waking. But you know, mauster, that's all blarney."

I then opened the letter to Mr Thomson, and found it dated precisely three years, all save three weeks, previously to the day it was opened. Barney never believed a word of all this until he went home to Fair River, and found his master's two daughters, whom he left girls, grown into fine women, and was obliged to take their words for the time of his absence.

But that's nothing at all. One discovery in any art or science always leads to greater anxiety and research. One day a piece of information came to my ear that interested me exceedingly. It was that a whole colony of the Strong-Bow Indians had at some former period been overtaken by a terrible snow-storm, on the very northmost part of the Rocky Mountains, and had every one, man and woman of them, perished; that an avalanche had lately shot down from a ravine in which were scores of bodies in a frozen state, and the fatal accident having happened long before the memory of any person living, so it behoved to be upwards of a century ago. This was a chance of an investigation not to be lost.

I provided every thing for a long journey; plenty to eat and to drink; with a number of excellent canoes, one of them not less than sixty feet long; and both skates and wheels for the portages. We sailed the whole way, it being spring, but in a very zig-zag direction, having only one considerable carrying-place, and another smaller one, until we came to M'Kenzie's River, which we sailed down to the influx of a river called the Liars. "Ay, weel named, Doctor, weel named," you will be saying to yourself when you read this. Well, we sailed up this with great difficulty, until we reached the nearest possible point for the object of our search. There we erected a temporary residence, and set out for the mountains. Having one of the Harefoot Indians for a guide, we went straight to the spot, and a singular scene was there presented to our view. There were corpses with their heads above the avalanche, and some with their heads downward, and their feet above; others, again, with one limb sticking up like a gun—a comical position; for all the parts that were above the snow were quite bare of flesh, consumed by the summer suns and beasts of prey; but the parts below the snow being jammed among solid ice, and quite rigid, appeared to be perfectly fresh. We brought home three subjects, apparently the most perfect, which we digged deep out from amongst the ice; and the very first that I thawed turned out to be a young man, short of stature, but well made, who, as soon as the rigidity was fairly overcome, began to emit some growling sounds from his throat, and was ultimately completely recovered.

The other two I did not venture to thaw, but first cut them in pieces, and thawed and dissected them afterwards. They are a pigmy, insignificant race, greatly inferior to us in all respects, and I think, in that inhospitable climate of theirs, must soon die out. They regarded me as an enormous giant, come to eat them all up, and kept always at a due distance from me. I think the word of my dissections had spread abroad among them, which had put that ridiculous idea into their heads.

One of the Harefoot Indians, who acted as our guide, proposed to me that we should proceed to the place where the colony had first perished, where it was probable I should find plenty of whole bodies. I thought the scheme a plausible one, and we set out accordingly, well provided with hands and mattocks, and soon found the place, from the breach the shot snow had left, which was full twenty feet perpendicular. The Indians directed us where to dig. They knew, from the formation of the tremendous wreath, from whence the storm had blown, and where the hapless group would naturally take shelter. They were right. We soon recovered plenty of bodies; and a woeful sight it was. Some were lying in pairs, clasped in each other's arms: some in groups, lying above each other, apparently whole families lying together. We loaded sixteen sleighs with them, of the youngest and freshest we could wale, great part of them women, for there were no children, who must all have been left at the settlement, and perished. I thawed them carefully and gently round a great fire, and they mostly came to life, though many of them died shortly after. I preserved all the young women, and brought a few of the best home with me, and they have done very well, and two of them are married, and have families. When you come to Upper Canada, my dear Shepherd, which I understand from Mr Dickson you are preparing to do—and the sooner you come the better—I shall introduce you to some of those who were thus singularly brought to life, and who are, of course, of an immense age.

W—— D——.

I'M NOT A SINGLE MAN.

Well, I confess, I did not guess
A simple marriage vow
Would make me find all womenkind
Such unkind women now.
They need not, sure, as *distant* be
As Java or Japan—
Yet ev'ry Miss reminds me this—
I'm not a single man!

Once they made choice of my bass voice
To share in each duett;
So well I danced, I somehow chanced
To stand in every set:
They now declare I cannot sing,
And dance on Bruin's plan;
Me draw!—me paint!—me any thing!—
I'm not a single man!

One used to stitch a collar then,
Another hemmed a frill;
I had more purses netted then
Than I could hope to fill.
I once could get a button on,
But now I never can—
My buttons then were Bachelor's—
I'm not a single man!

Oh how they hated politics
Thrust on me by papa:
But now my chat—they all leave that
To entertain mamma.
Mamma, who praises her own self,
Instead of Jane or Ann,
And lays "her girls" upon the shelf—
I'm not a single man!

Ah me, how strange it is the change,
In parlour and in hall,
They treat me so, if I but go
To make a morning call.
If they had hair in papers once,
Bolt up the stairs they ran;
They now sit still in dishabille—
I'm not a single man!

Miss Mary Bond was once so fond
Of Romans and of Greeks;
She daily sought my cabinet,
To study my antiques.
Well, now she doesn't care a dump
For ancient pot or pan,
Her taste at once is modernised—
I'm not a single man!

My spouse is fond of homely life,
And all that sort of thing;
I go to balls without my wife,
And never wear a ring:
And yet each Miss to whom I come,
As strange as Genghis Khan,
Knows by some sign, I can't divine,
I'm not a single man!

Go where I will, I but intrude,
I'm left in crowded rooms,
Like Zimmerman on Solitude,
Or Hervey at his Tombs.
From head to heel, they make me feel,
Of quite another clan;
Compelled to own, though left alone,
I'm not a single man!

'Tis hard to see how others fare,
Whilst I rejected stand—
Will no one take my arm because
They cannot have my hand?
Miss Parry, that for some would go
A trip to Hindostan,
With me don't care to mount a stair—
I'm not a single man!

Some change, of course, should be in force,
But, surely, not so much—
There may be hands I may not squeeze,
But must I never touch?—
Must I forbear to hand a chair,
And not pick up a fan?
But I have been myself picked up—
I'm not a single man!

I must confess I did not guess
A simple marriage vow
Would make me find all women-kind
Such unkind women now;—
I might be hash'd to death, or smash'd,
By Mr Pickford's van,
Without, I fear, a single tear—
I'm not a single man!

Hood's Comic Annual, 1831.

MINUTE WRITING.

We have known many persons who affected a taste for writing in extremely minute characters, as for instance of the Lord's Prayer, Creed, and the Ten Commandments, within the compass of a sixpence, or perhaps a silver penny. On this subject the learned D'Israeli has the following observations:—"The Iliad of Homer in a nutshell, which Pliny says that Cicero once saw, it is pretended might have been a fact, however to some it may appear impossible. Ælian notices an artist who wrote a distich in letters of gold, which he enclosed in the rind of a grain of corn.

Antiquity and modern times record many such penmen, whose glory consisted in writing in so small a hand that the writing could not be legible to the naked eye. One wrote a verse of Homer on a grain of millet, and another, more indefatigably trifling, transcribed the whole Iliad in so confined a space, that it could be enclosed in a nutshell. Menage mentions, he saw whole sentences which were not perceptible to the eye without the microscope; and pictures and portraits, which appeared at first to be lines and scratches thrown down at random; one of them formed the face of the dauphiness, with the most pleasing delicacy and correct resemblance. He read an Italian poem, in praise of this princess, containing some thousands of verses, written by an officer in a space of a foot and a half. This species of curious idleness has not been lost in our own country; where this minute writing has equalled any on record. Peter Bales, a celebrated caligraphist in the reign of Elizabeth, astonished the eyes of beholders, by showing them what they could not see; for, in the Harleian MSS. 530, we have a narrative of 'a rare piece of work brought to pass by Peter Bales, an Englishman, and a clerk of the chancery;' it seems by the description to have been the whole Bible 'in an English walnut no bigger than a hen's egg. The nut holdeth the book: there are as many leaves in his little book as the great Bible, and he hath written as much in one of his little leaves as a great leaf of the Bible.' We are told that this wonderfully unreadable copy of the Bible was 'seen by many thousands.' There is a drawing of the head of Charles the First, in the library of St John's College at Oxford, wholly composed of minute written characters, which at a small distance resemble the lines of an engraving. The lines of the head, and the ruff, are said to contain the book of Psalms, the Creed, and the Lord's Prayer. In the British Museum we find a drawing representing the portrait of Queen Anne, not much above the size of the hand. On this drawing appear a number of lines and scratches, which the librarian assures the marvelling spectator includes the entire contents of a thin *folio*, which on this occasion is carried in the hand.

On this subject it may be worth noticing, that the learned Huet asserts that he, like the rest of the world, for a long time considered as a fiction the story of that industrious writer who is said to have enclosed the Iliad in a nutshell. But having examined the matter more closely, he thought it possible. One day, in company at the dauphin's, this learned man trifled half an hour in proving it. A piece of vellum, about ten inches in length and eight in width, pliant and firm, can be folded up and enclosed in the shell of a large walnut. It can hold in its breadth one line, which can contain 30 verses, and in its length 250 lines. With a crow-quill the writing can be perfect. A page of this piece of vellum will then contain 7500 verses, and the reverse as much; the whole 15,000 verses of the Iliad. And this he proved in their presence, by using a piece of paper, and with a common pen. The thing is possible to be effected; and if on any occasion paper should be most excessively rare, it may be useful to know, that a volume of matter may be contained in a single leaf."

POWER OF SMALL ANIMALS.

The muscular power of small animals is particularly observable in the *Terada navalis*, or ship-worm, a native of India, which attacks the bottoms of ships in multitudes, and with such force, as has produced the necessity of coppering vessels, now so generally practised. This insect is only six inches in length, but the muscle with which its head is armed enables it easily to penetrate into the strongest oak plank. Each worm, in labouring, confines itself to its own shell, which is only divided from that of its neighbour by a partition not thicker than a piece of writing-paper. Although in this particular the ship-worm may be considered by the seamen as a nuisance, yet it is, on other occasions, a most useful friend to him, when the mouths of docks and harbours are blocked up by the wrecks of whole forests, laid waste by the tornado or whirlwind. It is then that the ship-worm proves its worth and usefulness. Immense hosts of the *Terada navalis* instantly attack those obstructions, and in a wonderfully short period entirely remove them.

London: Published, with Permission of the Proprietors, by Orr & Smith, Paternoster Row; G. Berwick, Holywell Street, Strand; Bancks & Co., Manchester; Wrightson & Webb, Birmingham; Willmer & Smith, Liverpool; W. E. Somerscale, Leeds; C. N. Wright, Nottingham; Westley & Co. Bristol; S. Simms, Bath; J. Johnson, Cambridge; W. Gain, Exeter; J. Purdon, Hull; G. Ridge, Sheffield; H. Bellerby, York; J. Taylor, Brighton; and sold by all Booksellers, Newsmen, &c. in town and country.—Chambers's Historical Newspaper, a Supplement to the present publication, is published on the first of every month; and Chambers's Information for the People, of which every number is a distinct subject of human knowledge, appears once every fortnight.

CHAMBERS' EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF "CHAMBERS'S HISTORICAL NEWSPAPER." AND "INFORMATION FOR THE PEOPLE."

No. 101. SATURDAY, JANUARY 4, 1834. PRICE THREE HALFPENCE.

IS IGNORANCE BLISS?

IT IS curious that, even in *this* age, we still occasionally hear people talking of the bliss of ignorance. Such people must certainly be very *happy* themselves, or they would never indulge in such a sentiment. What, on the contrary, is the source of all the peculiar enjoyments of this country, but knowledge?—what is the source of all the evils to which our contemporaries in other countries are subjected, and to which our own ancestors were liable, but ignorance? When a child burns its hands by grasping a hot iron, whether is it knowledge or ignorance that causes the evil? The case is an extreme one; but yet how many instances of pain and trouble, only a little less direct, might be adduced as springing, every day of our lives, from an unacquaintance with the laws under which we are designed to live!

It is most evident that man has been originally planted on the earth, without any information as to the laws of nature, but with faculties calculated in time to inform himself upon these matters. At the *very* first, the race must have had to struggle with dreadful difficulties: their total ignorance of the arts of catching, rearing, and cooking food, of preparing clothes, and forming proper habitations, must have caused numbers to perish miserably, before any became in the least comfortable. Always the nearer to this original state of things, we find the more calamities and distresses oppressing the tribes of earth—not only from ignorance of the means of taking advantage of the bounties of nature, but from the results of passions which they had not yet been taught to regulate. The early history of all nations abounds in transactions which appal the modern reader: in Poland, at the present day, we have but a meagre specimen of what used to be going on in our own country, when it was exposed to the violence of neighbouring states parallel in rudeness and ambition to Russia. Like the tides of locusts which *drift* up any high wall they may meet in their course, to enable the rest to pour over and pursue their route, ages after ages of imperfect knowledge and imperfect enjoyment have been squandered, in order that men might at last come to the superior comforts which they were designed to enjoy. Our ancestors at no distant date were subjected to periodical plagues, and died at the regular rate of one in about thirty every year, in consequence of their slothfulness and erroneous police regulations: gradually, they were impelled by the dread of these miseries to improve their acquaintance with natural laws, and act more in conformity to them; *we*, therefore, inheriting and improving upon these advantages, do not die at above the rate of one annually in fifty-eight. Undoubtedly, men could have been informed upon all these subjects at the very first—could have been made perfectly moral and innocent beings—whereby much misery, to appearance, would have been spared. Such a system, however, would not agree either with his faculties, or with the circumstances of nature. He was designed, evidently, to be an active being, to help himself, and, in proportion to his acting well or ill, to be the source of his own happiness and misery. The secrets of nature were veiled from his casual glance, in order that he might exercise his ingenuity, and give himself pleasure, in finding them out. He has not yet become fully acquainted either with his own nature or with the physical arrangements of the earth he inhabits. But always the more he learns on these points, the more will he abstain from injuring his fellow-creatures, the more surely will he provide for and guard his own comfort, and the more nearly will he approach to that moral and intellectual perfection which philosophers have dreamed that he might attain.

The uses of studying our own nature are perhaps less obvious than those connected with the study of physical nature; but they are not less important. A knowledge of human nature, and a habitual system of acting upon it, has come to be known in the present age by the expressive word *tact;* and it is certainly an accomplishment by which many great and direct advantages are to be gained by the individual, while the welfare of others is not in the least diminished, but rather increased. There is unfortunately no *system* of knowledge of this kind, if we except phrenology, which has not yet gained general attention or credence. But every man may learn a great deal from the ever-open book of nature itself, if he is only willing to inspect the movements of his fellow-creatures with any share of attention; and, imperfect as the science is, there are many books which he may study with advantage.* If a knowledge of human nature were to do us no more good than to teach us how to treat the single sentiment of self-love in our neighbours, it would be of boundless advantage. A great part of the discomfort which we experience in life, arises from our neglect of this principle; and always the lower we go in society, and the more nearly we approach the bounds of ignorance, the more mischief do we find arising from it. Vulgar persons call each other names: self-love rises in wrath, and bloodshed, or even murder, is perhaps the consequence. In more civilised circles, adroit sarcasms are used; and though the moral sense is there too strong to permit of actual violence, there is not the less strife and unhappiness found to arise from it. We have known individuals who had every worldly comfort at their command, render themselves and others supremely miserable, simply by the ignorant or unguarded way in which they treated the self-love of their fellow-creatures. They neither knew how to control it in themselves nor to respect it in others; and they therefore moved, it might be said, in a constant atmosphere of envy, hatred, and all uncharitableness, which involved all who came near them. It is evident that a little knowledge of human nature, and a wise, tender, and humane way of considering the feelings and privileges of our neighbours, would obviate all such evils.

In the relations of commercial life, of how much use must this knowledge prove, and how disadvantageous must be the want of it! Men of business have to depute much to others; but unless they can form some estimate of the character of the deputy, and calculate how such a trust is apt to operate upon it, will they not be liable every day to the most serious calamities? They have also to form intimate and confidential relations with partners, fellow-dealers, and others; but if they have not some power of penetrating the intentions, estimating the powers, and calculating the steadiness of these individuals, will they not be in the greatest danger? Perhaps, however, there is no circumstance in human life where a knowledge of human nature is of more value than in the formation of a matrimonial engagement. Unfortunately, this arrangement is generally entered into in youth, when the faculty of penetrating character is at the greenest, and when it is apt, moreover, to be perverted by passion. Hence the numerous miseries, which, in so many instances, arise from wedded life. The parties were mutually ignorant of each other's character; they now find each other to be so unsuitable as mutually to increase, instead of diminishing, the current evils of life; and they either struggle on to the end or an embittered and unprosperous existence, or separate to their common disgrace, and are blighted for ever.

The advancement of happiness, by the acquisition of general knowledge, is, we have said, a still more obvious truth than even the above. The progress from ignorance to knowledge is itself a path of pleasure: every new fact or truth that we acquire conveys a sensible satisfaction to the mind; hence it is clear, that our advancing from the primitive condition of ignorance to one more or less the reverse, is an absolute rule of our being, to resist which can never be conducive to happiness. The advantages of knowledge, when at length acquired, may be experienced in various ways. By knowledge of the laws of physical nature, even so far as they have already been explained, we may, as individuals, avoid many evils which would otherwise befall us, and bring ourselves many advantages which we would otherwise never know. As a community, do we not every moment partake of the immense advantages which such knowledge has achieved, and is constantly achieving? Does not the knowledge of the power of steam, for example, confer blessings upon us in almost every minute circumstance of our lives? If a life is lost at sea through an insufficiency in the vessel, or on land by a failure of the machinery to which we have trusted for locomotion, it is a sacrifice to ignorance, or neglect of the physical laws. If a labourer is killed by the rushing of a quarry, which he has too much undermined, he is the victim of ignorance of the physical laws, joined to an undue desire to shorten his work. An immense proportion of the accidents which take place, and which spread so much misery among families, might be obviated, if men were in general less ignorant, and less negligent. A more extended knowledge of the law of gravitation alone, would, we are persuaded, be the means of sparing many tears. The loss of lives by storms at sea is generally looked upon as what is called a natural evil, which no man can prevent; yet, through a superior acquaintance with natural laws, fewer lives are now lost by such means than formerly; and hence it is not too much to infer, that, if knowledge continues to increase, a time will come when the dangers of the sea may be almost entirely, if not entirely, overcome. The explosion of fire-damp in mines was not long ago regarded as one of those unavoidable evils, arising from the nature of things; but we have lately seen another law of nature—the incapability of flame to communicate through wire gauze—brought to bear upon it, and lives are no longer in danger from this cause. It may be said that it is the duty of particular minds, of a studious character, to see after the good of mankind in these matters, as the most of men are too much engaged, each in his own several pursuit, to have either time or attention to bestow upon them. It is so in some measure; but, at the same time, individuals may easily learn a great deal beyond the immediate sphere of their own profession, if they have only the inclination; and this knowledge, exerted by themselves, may be of service in numberless cases where it would be idle to call for the aid of a professed philosopher. A knowledge of the laws we speak of ought to be part of the education of every individual in the state—on the same grounds that it is the duty of all nurses to teach children to avoid putting their hands into the fire, or clambering along precipices. If such were the case, a kind of science, now deemed proper only to a student, would be identified with the mass of that almost unconscious knowledge which every sane person pos-

* We would particularly recommend one small and cheap treatise, Combe's "Constitution of Man considered in Relation to External Objects." This work is founded upon phrenological views; but these are so separable from the general body and spirit of the book, as to be of no consequence even to the most inveterate disbeliever in the science which the profound and accomplished author has done so much to propagate. The present article, though embracing some new views, is chiefly designed as an abstract of Mr Combe's volume.

senses, and through the means of which we walk, eat, and speak. The luggage of our minds, so to speak, would be in no respect more cumbersome than before, and our happiness would be both positively and negatively increased.

Another kind of knowledge immediately necessary for the improvement of our condition is a knowledge of the organic laws—of the laws, namely, which govern the system of our own frames. If we are totally ignorant of the nature of our bodies, and of the evils to which they are under certain circumstances exposed, we run the greatest danger of rendering ourselves miserable for a longer or shorter space of time, or of altogether cutting short our lives. If a man is either ignorant or reckless of the consequences of a sudden blast of cold coming upon the heated skin, ten to one he is destroyed in the middle of his days by a catarrh. If he does not know that to drink cold water when warm, or to sit down upon damp grass, is detrimental, he will hardly reach an old age. It will be said that the most of people are aware of these dangers, and avoid them: we answer, it is, then, the utmost extent of the knowledge of even that cautious class. There are innumerable contingencies in life, where a little knowledge of anatomy or medicine, enough to give a proper sense of the extent of danger, would prevent the last and worst of human calamities. It was the fate of the present writer, only a few months ago, to witness the death of a very near relation of only twenty-five years of age, whose disease might have been easily turned aside, if the unhappy sufferer had only been instructed in the slightest degree in the organic laws. This young man had caught a slight cold in the beginning of winter; and, instead of retiring to his chamber, to get quit of it by a few simple applications, he continued to go abroad as usual, and even undertook one or two long journies. The malady which *one day* of retirement could at one time have banished, then took firmer hold, and settled upon the windpipe. Still, even when deprived of his voice, and when various friends endeavoured, by all possible means, to convince him of the rashness of his conduct, he persisted in exposing himself—his business, he said, being such that he could not think of withdrawing from it. He at length did retire, but only when the disease had fixed itself in such a manner upon the *bronchiæ*, as to baffle every attempt to reach it. For about a month he suffered the intensest agonies under those fruitless applications, and then sunk under the remorseless gripe of a disease, which, if he had been more prudent, or better acquainted with the constitution of his own body, and the action of certain natural influences upon it, might have been easily turned aside. Here was a ruin of the most deplorable kind—the death of a young man entering into the world with the best prospects, for whom much had been done to bring him to that point in life, and in whom many hopes and wishes were centred—produced by the ignorance which some hold to be of so blissful a character. Such is a specimen of the way in which ignorance of this particular kind may affect an individual: we shall give an instance of the way in which it sometimes acts upon a community. "A gentleman, who died ten years ago," says Mr Combe,* "at an advanced period of life, told me, that, six miles west from Edinburgh, the country was so unhealthy in his youth, that every spring the farmers and their servants were seized with fever and ague, and required regularly to undergo bleeding and a course of medicine, to prevent attacks, or restore them from their effects. At the time, these visitations were believed to be sent by Providence, and to be inherent in the constitution of things: after, however, said my informant, an improved system of agriculture and draining was established, and vast pools of stagnant water formerly left between the ridges in the fields were removed, dunghills carried to a distance from the houses, and the houses themselves made more spacious and commodious, every symptom of ague and marsh-fever disappeared from the district, and it became highly salubrious. In other words, as soon as the gross infringement of the organic laws was abated by a more active exertion of the muscular and intellectual powers of man, the punishment ceased." This habit of attributing to Providence all the evils with the sources of which we are unacquainted, is entitled to the utmost respect, as it is the mark of a pious and well-disposed mind; but it is liable to lead us into strange errors—for in all probability what we attribute to this sacred cause, could be traced by a better instructed person to some simple circumstance, such as the pools and dunghills in the above anecdote. When any great calamity occurs, and we do not at first see any source for it in nature, let us endeavour, in the first place, to increase our knowledge of nature, so as to determine that it really is not there: in doing so, we shall, in all probability, sooner or later discover the cause of our affliction in some natural thing—something intended, no doubt, in the original constitution of things, to promote that active exertion of the faculties which is one of the primary laws of the human constitution, but no more directed by a special interposition than the burning of a finger which has been put into the fire. A still more remarkable exemplification of the evils of ignorance on a large scale is to be found in the history of what is called the humoral system in medicine. For fifteen centuries before the last, it was erroneously supposed that *all* maladies lay in the humours of the body; and hence blood-letting was practised periodically to prevent disease, and almost unintermittently to cure it, though such treatment could only be right in a few out of many cases. There can be little doubt that the traditional obloquy in which physicians are held in our popular literature, is mainly owing to the sufferings of the human race for so many centuries under this tremendous evil, the whole of which arose from ignorance. The practice now obtains only in such dark countries as Spain, where every village has still its *Sangrador* or bloodletter; and can there be any doubt of the vast advantages which *we* enjoy, under a more enlightened system?

If we were to study the fates of our fellow-creatures, as they pass before our observation, with a view expressly to the physical, organic, moral, and intellectual laws, we would generally find happiness more or less in proportion to a knowledge of, and obedience to these, and misery in proportion. Many of the labouring classes marry early and under circumstances entirely violative of the moral law; the miserable consequences can be traced by every one. Men expose themselves to dangers which knowledge would have taught them to avoid, and their lives, or their health, or their comfort in a greater or less degree, are consequently sacrificed. Innumerable ills are incurred through the too eager pursuit of wealth: the health of the body, the culture of the mind, the improvement of the moral faculties, are all neglected for this object: and thus men, in seeking the means, lose the end. Even where every physical comfort prevails, some individuals provoke wretchedness by their ill-regulated sentiments and propensities; a just punishment for the neglect of mental cultivation. Many are unsuccessful in all their pursuits, from not having selected a profession for which their capacities are adapted. In short, so many and so various are the disasters arising from ignorance of the laws under which we were designed to live upon earth, and the relations which our faculties bear to the objects of nature, that man may be said to have his own fate in a great measure within his own power—and hence one of the reasons for a general system of education under the patronage of the state. There ought to be schools in every considerable seat of population, for teaching—not Greek and Latin, or English, writing, and arithmetic, *exclusively*—for these are but *means* of useful knowledge—but the laws of nature in all their branches, the laws of the human faculties and sentiments, and, in general, the means of improving our individual and social condition on the globe which we inhabit.

* Constitution of Man, p. 124.

SALT.

This familiar and useful substance, which exists, in several forms and in immense quantities, all over the face of the earth, is scientifically denominated the *muriate of soda*. Its name in Latin is *sal;* in Spanish *sal;* in French *sel;* in Italian *sale;* in Russian *sol;* in Dutch *zout;* in German *salz;* in Arabian *melh;* in Hindostanee *nimmuck;* and in Chinese *yen*. It is evidently one of those things which have been designed from the beginning for the ordinary and daily use of man; and, therefore, is dispersed over the earth in such ways as to make it in general easily accessible to him. Nevertheless, it is not, like the most of the other great staples of human consumption which nature has taken it upon herself to supply, a nutritious substance. It appears simply designed to give a relish to food, to aid in its digestion, and to preserve meat which we may wish to hoard against future necessity. It is, of all condiments, the safest, best, and most extensively employed; but yet, when taken in too large quantities, or applied too profusely for the preservation of meat, it has a detrimental effect. The common people in Scotland believe that too much salt tends to darken the complexion, and take away the gloss of the skin, and they therefore warn their children not to eat it by itself, which all children are naturally apt to do.

Salt is found in greater or less quantities in almost every substance on earth; but the waters of the sea appear to have been its first great magazine. It is found there dissolved, in certain proportions (for which we may refer to a late article on the sea); two purposes being thus served—namely, the preservation of that vast body of waters, which otherwise would become an insupportable mass of corruption, and the diffusion of this important alimentary article over the face of the globe. If salt, however, were only to be obtained from the sea, the people who live throughout large continents would find a great difficulty in supplying themselves with it, and might thus suffer great evils from the want of so useful a substance. For this reason (for the design is too obvious to be a matter of doubt), nature has provided that the sea, on leaving those continents, all of which were once overspread with it, should deposit vast quantities of this constituent substance, in many places throughout the country, sufficient to provide for ever for the necessities of the inhabitants of those parts. In some places, this deposit lies exposed on the surface of the ground, in a glittering crust several inches thick; in others much thicker layers have, during the protracted processes of creation, been covered over with layers of totally different substances, which subsequent submersion had brought over them, so that the salt now requires to be dug for, like coal or any other mineral. Salt is found in this last shape in every quarter, and almost in every country in the world; and it is certainly amazing to reflect that, probably thousands of ages before man was created, means were taken to furnish him *conveniently* with the salt which it was *known* he would require for a relish to his daily victuals. In some places, especially in the central parts of North America, the trouble even of digging is saved to man by nature; for the springs of fresh water, in bursting through to the surface, become tinctured with salt from the subterraneous deposits; and this only requires to be boiled in order to produce salt.

Of the various ways of obtaining salt for domestic purposes, the most primitive, perhaps, is that by which the heat of the sun is caused to assist in the process. It is practised to a great extent in France, Spain, and Portugal, from the last of which countries we annually import between three and four hundred thousand bushels, so prepared. Large flat spaces of ground are banked off in connection with the sea, and a shallow pool of sea-water being introduced and sluiced off, is permitted to dry up, so as to leave the salt behind. This is raised in the shape of a cake, and piled up in a dry place, where it is allowed to stand for two or three years, till all the bitter and earthy parts have been drained off. Salt made in this manner is considered the best for preserving meat. Till a recent period, salt was made in nearly the same manner at Ruthwell, on the coast of the Solway Firth, in Scotland. People collected a saline crust on the sea-beach in warm weather; and as they could not obtain it without taking the surface of the sand also, they put the whole into pits, from which, by pouring in salt water, they drained off a very strong brine, which only required a little firing in order to produce a coarse kind of salt. It is curious to find, from the researches of recent voyagers, that the people of the Great Island of Loo Choo, in the Pacific Ocean, obtain this indispensable article in exactly the same manner.

In countries where the sun does not offer much assistance, and no mines or salt-springs are at hand, the boiling of sea-water in works upon the coast is resorted to. Such is and has always been the case in Scotland, excepting in the solitary instance above mentioned. Salt-works were in that country given as donations to abbeys seven hundred years ago. In 1128, David the First gave the salt-pan at Airth, near the head of the Firth of Forth, with many other things, to endow the Abbey of Holyrood at Edinburgh; and it is evident, from the chartularies of Newbottle, that that conventual establishment had salt-pans on the same estuary in the twelfth and thirteenth centuries. The mode of the manufacture is said to have been improved by some of Queen Mary's French attendants, who, in consequence, obtained from their mistress an exclusive privilege for the manufacture, which lasted till the reign of Charles the Second. The process now followed in Scotland may be very briefly described. A reservoir is built near the sea, into which, at high water, supplies are taken in by means of a pipe extending a good way down the beach; for it is an object to get the water from a point as far below the surface as possible, so that it may be the more impregnated with salt, and require the less firing. From the reservoir, the water is pumped into the neighbouring pans, which generally extend in a range on both sides. The pans are shallow vessels of plate iron, about twenty feet by twelve, having a furnace below, with a space for holding coal. The whole apparatus is contained in a small cot, the covering of which is of deals, fastened by wooden pins, as iron nails are liable to be quickly corroded by the vapour from the salt. At the meeting of the roof, a space is left, to permit the vapour to escape. Two men, one of whom is a kind of drudge to the other, attend each pan; and they are not much cleaner or neater in appearance than coal-miners. This class of men in Scotland, together with colliers, were, till the year 1776, *slaves*—slaves to all intents and purposes—and, what is more curious, when their freedom was obtained by an application of their enlightened proprietors to Parliament, they exclaimed against the proposal, as a mere attempt on the part of those gentlemen to shake themselves clear of some small burden, to which they were liable by custom when one of the salters or coalmen happened to take a wife. The coal employed is the small kind, which is always considered as refuse at the Scotch pits; the salters call it *wood*, such having been perhaps the original fuel employed in the works. Bullock's blood is put into the boiling water, to bring its impurities to the top, which are skimmed off. When the water has boiled down, more is pumped in; and this process is repeated before the salt is finally drawn. From a pan of 1300 gallons, fifteen or twenty bushels, of fifty-six pounds each, are obtained in this manner, the process requiring about twenty-four hours. An oily residuum is carefully collected, and employed in the manufacture of magnesia. In general, the pans are only put through five processes in the week, which leaves the Saturday afternoon as a period of recreation to the men. The salt is at first very light and floury, in proportion to its bulk, and in this state is most appreciated. A still finer article, resolving into large crystals, is made between the last pan of one week and the first of an-

other, while the fire is low; and this is called *Sunday salt.*

A large proportion of the salt used in England, and nearly the whole of what is consumed in the United States of America, is derived from salt-springs, which, as already mentioned, issue forth at various places far removed from the sea. In Cheshire and Worcestershire are the chief salt-springs in England. At Northwich, in the former county, where there are also salt-mines, the trade of manufacturing salt from springs is carried on to a great extent, and has been so ever since the reign of Charles the Second. The water is generally impregnated with salt to the extent of twenty-two per cent., which is double the average of the springs found in France; and the process is almost exactly the same as that above described. All over the back settlements of America there are numerous salt-springs, which are there called *salt-licks;* and an immense quantity is yearly manufactured from them, though the processes appear of an inferior order, and the salt produced not nearly so good as that made in England. Hence, no less than three millions and a half of bushels were exported from Britain to the United States in 1829, besides a million and a half to our own colonies bordering on that republic. American travellers mention that the salt-licks are much resorted to by animals, who seem to have as much need for this condiment as human beings. Flint speaks of tracks in the woods extending for hundreds of miles, and formed solely by wild animals on their way to the salt-licks. It is probable that most of the country west from the Alleghany mountains, and between 31° and 45° north latitude, is pervaded by a stratum of salt, deposited there by the evaporation of a vast lake or central sea, long since vanished.

We now come to speak of salt as found, in a solid shape, either on the surface of the earth, or in subterraneous beds. On both sides of the Atlas mountains, in the north of Africa, there are plains covered thickly with salt several miles in width, and extending as far as the eye can reach. In Abyssinia, there is a plain of salt four days' journey across. In North America, large prairies near the sources of the Arkansas river, and on both sides of the Rocky Mountains, are found covered with a cake of salt several inches thick. In these and similar instances it is to be supposed that the sea covered the ground at a comparatively recent period, when nearly the present levels had been attained. Where salt, however, is found in profound mines, or in large masses above the general surface, and intermixed or covered with soil, it is to be presumed that the deposit took place in the early stages of creation, or at least of the arrangement of the materials of the globe. Spain is the country where salt is found most generally in masses above the general surface. At Cordova there is a mountain, 300 feet high, which consists to the amount of four-fifths of salt. At no great distance is a promontory more than double that height, which consists altogether of salt of a red colour. At La Mancha there is a similar mass 210 feet in diameter. And near the river Ebro, there is a whole chain of hills, consisting of salt, mixed with layers of limestone. The salt-mines of the Tyrol are also in a mountain, so that they can be wrought by horizontal excavations. In Peru, there are salt-mines on mountainous situations no less than 10,000 feet above the present level of the sea!

Where salt is found in beds beneath the general surface, it is generally found to rest upon some one of the class of rocks which are considered as of secondary formation, and to be covered with others of a similar kind, such as sandstone, limestone, clay, and so forth. The beds in Cheshire occur from thirty to fifty yards beneath the surface, and are from twenty to thirty yards thick, consisting of a hard clear reddish crystal, which requires to be dissolved in water and clarified before it is fit for use. It is dug like coal, by pick-axes and wedges, and sometimes is blasted with gunpowder. The greater part is exported to America, to the Netherlands, and even to Russia and Prussia. The mines are dry and healthy, and, being supported by thick pillars of salt at proper distances, have a striking appearance when illuminated. There are similar salt-mines in various parts of Germany and Hungary. But the most wonderful are those of Poland, which have been wrought ever since the fifth century, and, being in the hands of government, are the source of an immense revenue. The entrances to the pits are a few miles from Cracow; but the city is completely undermined, and is suspended, as it were, upon pillars of salt. The vaults or spaces whence the salt has been extracted, are uncommonly large and spacious; some of them contain chapels, of which that of St Anthony is thirty feet high, and is furnished with images of the saints cut out of the prevailing mineral. Others of the vaults are used as magazines for salt after it has been dug; and some are employed as stables for the horses, a great number of which are in constant use. The roof is supported either by masses of the salt left for that purpose, or by timber posts; but in some places there are large vaults, which appear without any support, and lead the eye into uninterrupted gloom. The whole are dry and healthy; and the miners, who work six or eight hours at a time, attain the ordinary length of human life.

An analysis of various kinds of foreign and domestic salt was made some years ago, by Dr Henry of Manchester, in order to ascertain the respective purity of each. From the experiments of this gentleman, it appeared that that called the fishery salt, produced in Cheshire, contains 986¾ parts of pure muriate of soda in 1000, the remaining 13¼ parts being chiefly of sulphate of lime. The salt formed by simply crushing the rock of the Cheshire mines is little inferior in purity, being 983¼ parts of muriate of soda to 6¼ of sulphate of lime, 10 of insoluble earthy matter, and various minute proportions of muriates and sulphates. The Scotch common salt was found by Dr Henry to have only 935¼ of pure muriate of soda or genuine salt, to 28 muriate of magnesia, 4 of earthy matter, 15 sulphate of lime, and 17¼ sulphate of magnesia. The French salt, made in the peculiar way already described, hovers in purity between the common Scotch and the Cheshire kinds. Of the rock-salt of eastern Europe no analysis that we are aware of has yet been taken.

It was calculated by M. Necker, the great financier, that the people of France annually consumed 19½ pounds of salt each at an average. Mr M'Culloch calculates that those of Great Britain consume each 22 pounds, and assigns the difference in the chief aliments of the two countries as the cause why the Englishman eats two pounds and a half more than his neighbour on the other side of the Channel. It appears, however, that, even in the same species of food, different nations may employ very different quantities of salt. The bread of Great Britain contains a pound of salt to the bushel of flour, while that of the United States contains only half a pound. Salt is used for many other purposes besides giving a relish to food. It is employed in glass-making, in the manufacture of bleaching-liquor, in the operations of the skinner, in making the glaze for earthenware, and in the preparation of a number of useful and extensively-used medicines.

Salt is now used to a considerable extent in agriculture—an idea suggested upwards of two centuries ago by Napier, the inventor of the logarithms, but never acted upon till the present age. Sowed in a certain quantity upon the ground, it acts as a stimulant to vegetable life, by exciting the absorbent vessels into greater action than usual, and thereby causing them to take up their nourishment more rapidly, and perform their secretions and circulations with greater energy, which necessarily increases the growth. Care must be taken, however, to give only a certain quantity, for, when applied too liberally, it destroys vegetation altogether, and leaves only a brown and withered surface. Of course, those parts of tropical countries which are covered thickly with salt, remain in a state of perpetual barrenness. The scriptural writers were aware of this natural fact, and in several parts of the Bible we find the sowing of salt used as a metaphor for rendering a place desolate. There being a valley between Tadmor and Idumea in this condition, was perhaps what suggested the idea to the Jewish writers. It is curious that, in 1596, about the very time when Napier was cogitating the plan of rendering the soil fruitful by a moderate sprinkling of salt, we find his neighbour and sovereign, King James the Sixth, threatening to raze Edinburgh to the foundation, and sow the place with salt, after the scriptural idea of lasting desolation, as a punishment for the riotous behaviour of the inhabitants.* Salt had also something of a sacred character in the estimation of ancient nations. It was a symbol of friendship and fidelity, due to guests, friends, or servants, from their entertainers or masters; and to this day, in some eastern countries, if a guest has tasted salt with his host, his person will be held inviolable, even although the individual may be afterwards discovered to have done his entertainer some grievous wrong. The sacrifices of the Jews were all seasoned with salt, and we read in the Bible of a covenant of salt. It has also its place in modern superstition. Among the common people all over Scotland, a new house, or one which a new tenant was about to enter, was always sprinkled with salt, by way of inducing *luck.* A plate of salt used regularly to be deposited on the breast of a corpse after it was dressed; a custom which was probably meant at first to have the effect of a charm, in warding off evil influences of one kind or another. Another custom of a curious nature once prevailed in our own, and probably also in other countries, in reference to salt. Men of rank, it is well known, formerly dined at the same table with their dependents and servants. The master of the house and his immediate relations sat at the upper end, where the floor was a little elevated. The persons of greatest consequence sat next, and all along down the sides, towards the bottom, the rank of the guests declined by well-considered gradations, till the servants were found at the bottom. At a certain part of the table, was placed a huge salt-vat, which formed a line of demarcation between the superior and the inferior orders. Sitting above the salt was the mark of a gentleman, or man of good connections; while to sit beneath it indicated a humble station in society. There was also a gradation of liquors, from the generous wine at the head, to the small beer at the bottom: but with this custom, though perhaps of more material consequence than the other, we have at present no concern.

Salt was the subject of a tax among the Romans, and has been so among most modern nations. The tax was in France so very oppressive, and, by provoking smuggling, caused so many thousands of persons to be annually sent to the gallies, that it is reckoned to have been one of the leading causes of the revolution. In this country, a tax was first imposed in the reign of William the Third. In 1798, it amounted to 5s. a-bushel, or about a penny a-pound; but it afterwards rose in England to 15s. a-bushel, which caused a great deal of smuggling. The bad effects of the high duty being strongly represented to the House of Commons, it was, in 1823, removed altogether; which was certainly an unnecessary extent of relief, as a million a-year might have easily been raised from this article, for the service of the state, without being felt by the people, or causing any contraband dealings. The article is now sold at about 14s. or 16s. per ton.

* See both facts in Birrel's Diary, Dalyell's Fragments of Scottish History, 4to. 1798.

MANNERS OF WEST INDIA SLAVES.

A GENTLEMAN, resident in St Vincent's, has sent us a large mass of interesting original information on the condition and character of the slaves on one of the estates in that island; but from the controversial nature of the subject, we are prevented from inserting any portion of the details in our Journal, except that which relates to the manners and customs of the negroes.

"In their manners (says our correspondent) they are more polite than many would be inclined to credit: for you hear them, at every turn, addressing not only their superiors, but each other, with, 'Yes, sir'—'No, ma'am'—'My good lady there,' meaning his wife—'Brother,' 'Sister,' or 'Cousin,' and other expressions that would amuse as well as surprise a stranger. They are passionately fond of dress, singing, and dancing. Whatever money they make is usually laid out in finery of some description, which they arrange with a good deal of taste, especially the ornaments for the head, as handkerchiefs and turbans. The hair, which is naturally short and woolly, they endeavour, by every expedient, to draw out its curls, by forming little cork-screw plaits all over the head; and the men, who are for the most part beardless, are delighted to have a razor, to encourage the growth of the down upon their chin. They wear no shoes, except on grand occasions, more as an ornament to gratify their vanity than any advantage, as they appear to be rather an encumbrance than conveniences; for in going or returning from a festival, you often find them with their shoes in their hands, or, if not, hobbling like a cat in walnut shells. Many of them are able to plait straw hats, which they do very neatly, of a coarse, light, and flexible grass, which grows in abundance in the fields.

The usual dress of the men is a pair of white trousers and shirt, with a straw hat; but others wear, in addition, a blue jacket and black hat. The women wear a gown, chemise, and petticoat, with a handkerchief or Scotch cap on the head, and a necklace of coloured beads round the neck; to which they also sometimes add a hat, neckerchief, &c. They are passionately fond of music, and very readily acquire any tune they hear, turning every circumstance or important event into such rude verses as those sung on the day after my arrival at Grand Sable Estate, when they had holiday given them, and something to make merry.

'My Lady Brisbane gone away,
Massa come and give us holiday,
Huzza! huzza!'

And these you hear repeated over and over again, as they pass along the road, or down the cane-rows at work. On another occasion, when returning from an excursion, I was amused as well as surprised by hearing a negro boy as he approached me whistling, with great accuracy and precision, and at the same time with some melody and execution, the hunting-song in Der Freischutz. The adult negroes, when working in the fields, have their favourite songs, in which the whole gang unite, iterating or bringing down together a long line of glittering hoes in exact time; the delicate and attenuated voices of the females, blended sweetly and prettily with the full deep tones of the male performers. Our negro sailors, too, have their nautical songs, similar to the 'Canadian boat-song,' and ply the oar, or pull upon the hawser and capstan, adapting the measure to the slowness or rapidity of their movements. Nay, even the little Creole gang of children have some favourite choruses; and a leader, a little improvisature, who composes as he goes along, drawing from the stores of his own imagination, or forming rude verses from the ideas suggested by passing objects: first comes the solo of their leader, and then his little band of followers, joining in one simultaneous and merry chorus, beating the time with their hands or upon their little breakfast tins.

Dances and entertainments are given all over the island at Christmas, when they have three days' holidays, and sometimes got up in such a style, that a gentleman assured me he had known a negro spend a very large sum of money, and kill two fat pigs at his ball and supper, for which they issue a sort of invitation card. They have a display of all kinds of vegetables, with fowls, pork, &c.; and sport in addition, too, rum, bottled porter, and Madeira wine. They who cannot afford to give entertainments, give so much for a ticket of admission to the ball-room and permission to dance. On these occasions, they spend the greater part both of the day and night in singing with their usual characteristic ardour and agility, displaying such an easy graceful movement, and marking

with so much precision the time and tune, that their performances would often do credit to the more practised elegante; and is very favourably contrasted with the rude earnestness and clumsy movement of the English peasant, who, neglecting or ignorant of the airy movement 'on the light fantastic toe,' confines his skill to the incessant thumping of his heel in or out of tune, or an awkward swing, endangering his neighbours' shins by his ungraceful pirouette. The ladies dress themselves out with great taste; and I have seen some of the men dressed in long black or blue coats, with white stockings and pumps; white pinked striped or nankeen trousers; a white plaited shirt and neckcloth, and a broad scarlet riband passing round the neck, and brought to the waistcoat-pocket, in imitation of the riband for an eye-glass or watch-guard, having at the same time in his hand or waistcoat-pocket a bottle of lavender water, to refresh himself and partner. In dancing country dances, they have a custom peculiar to themselves; and that is, whenever any gentleman who is out of the set observes another too long a time dancing with a particular lady, he advances towards him, making a low and graceful bow, and, calling him out, takes the hand of his *fair* partner."

BIOGRAPHIC SKETCHES.

SIR THOMAS LAWRENCE.

In the life of this distinguished painter, we find an extraordinary instance both of the precocity of genius and its power of raising the most humble individual, by well-pursued industry, to the highest eminence in public estimation.

Thomas Lawrence was born at Bristol in 1769, and was the youngest of a family of sixteen children. His father, who had been bred an attorney, and was afterwards an officer of excise, at the time his son Thomas was born, kept an inn in Bristol; but his business here being unsuccessful, he removed, in 1772, to Devizes, in Wiltshire, where he became the landlord of the Black Bear. It appears that this removal was by no means advantageous to Thomas's father, who was a man of singular manners, and was fonder of spouting poetry to his guests than attending steadily to the affairs of his household. His mother, we are told, was a person of a very different and more respectable character. While in this house at the town of Devizes, the wonderful genius of little Thomas began to be manifested. He could recite verses to the admiration of all who heard him, and, by a natural faculty, began to use a pencil, and take likenesses—an accomplishment which induced his parents to present him to all strangers of note who visited their house. A striking instance of this precocity of talent occurred when he was but five years of age, and is thus mentioned:—Lord and Lady Kenyon happening to stop for a day at the Black Bear, on their way to Bath, Mr Lawrence, the landlord, entered their apartment, and began to expatiate on the genius of his boy, who, "although only in his fifth year, could recite them poetry, or speeches, or take their likenesses, whichever they chose." Lady Kenyon was, in the first instance, somewhat annoyed by the interruption; but there presently capered into the room, straddling upon a stick, the most lovely and spirited child she had ever beheld. His beautiful face was flushed with exercise, and neither she nor her husband felt inclined to stop his gambols. As soon as the boy could be induced to stand still, Lady Kenyon took him into her arms, and asked him if he could take the likeness of that gentleman, pointing to the future Lord Chief Justice. The child, looking with an impatient earnestness at Lord Kenyon, exclaimed, "Yes, that I can, and very like too." Whilst materials were sent for, the child resumed his play; but when all was prepared, throwing his little legs from over his stick, he was lifted on the table, and seated in an arm chair, from which height he took Lord Kenyon's likeness, with a rapidity, a spirit, and a correctness truly astonishing. That done, he was impatient to be gone; but his lordship, coaxing him, asked if he could take the likeness of the lady. The boy exclaimed, "Yes, that I can, if she will only turn her side to me, for her face is not straight." This produced a burst of laughter; for Lady Kenyon, by an accident, had a slight curvature of the nose. The child took the profile. Twenty-five years after, an old friend of Lady Kenyon saw this portrait, and could distinctly trace a resemblance to what her ladyship had been at the period when it was taken.

At the age of six years, little Lawrence was sent to school, where he remained only two years; and this was all the education he ever received, except a few lessons afterwards in Latin and French from a dissenting clergyman. From his sixth to his tenth year, he continued to take likenesses occasionally, and to be exhibited as a prodigy by his partial father, who seems to have in some measure lived on the profits of his son's ingenious exertions. At the age of ten, the young artist commenced, of his own accord, to execute original compositions of a higher class. He painted several scripture pieces; and his fame in this branch of the arts also spreading, he was invited by gentlemen to visit their galleries of paintings from the eminent masters.

The erratic efforts of the rising artist did not save his father from ruin. Old Lawrence failed in his business at Devizes, and removed to Bath, where he placed his son a pupil with Mr Hoare, a crayon-painter of taste and fancy. Under this excellent master he acquired those qualities of grace, delicacy, and spirit, which afterwards distinguished his productions. While at Bath, and only thirteen years of age, he made a drawing of the Transfiguration, which having sent to the exhibition of the Society of Arts, was rewarded by the society conferring upon him the great silver pallette, and five guineas, in approbation of his abilities. During his residence at this place of fashionable resort, he was taken by his father on excursions to Oxford, Salisbury, and other towns, where he obtained considerable occupation for his pencil. It is said he generally received four sitters every day, giving to each half an hour, and half an hour longer from memory. When about sixteen years of age, he was strongly inclined to make the stage his profession, and he actually performed at the Bath theatre; but from this line of life he was happily diverted, and turned to better pursuits. He remained at Bath about six years; and, during the whole of this period, young as he was, he was the sole support of his father and the other members of the family. At length, his father, either thinking that his labours might be made still more profitable in a wider field, or perhaps prevailed upon by the remonstrances of his son, determined to remove to London.

It was in the early part of the year 1787, when in his eighteenth year, that young Lawrence was brought to the metropolis, to commence that career which terminated so triumphantly. He was now in the midst of institutions established for affording instructions in his art, and this was a most fortunate circumstance for him at this crisis in his life. It appears, that, on the arrival of the family in London, his father immediately hired a handsome suite of apartments in Leicester Square, in the immediate neighbourhood of the rooms of Sir Joshua Reynolds, to whom he was anxious his son should be introduced. On applying to this great painter for this purpose, an interview was appointed; and young Lawrence, with the sensibility inseparable from worth and talents, was taken to the painting-room of this distinguished head of the English school of art. Sir Joshua was forcibly struck by the beauty, fine figure, and graceful manner of the lad, and received him with an attention and a benignity that dissipated his apprehensions, and restored him to self-possession. The performance he brought with him was examined, and partially approved of; and having given the young painter several valuable directions, kindly told him he was welcome whenever he chose to call. Lawrence listened to his remarks with deference, and felt grateful for the attention bestowed upon him. Seeing now the folly of his father in wishing to set him up as a master of the art of painting, he very soon removed from Leicester Square to less splendid lodgings in Tavistock Street, Covent Garden, and procured himself to be admitted a student at the Royal Academy.

From this period may be dated the rapid rise of Mr Lawrence into notice in the higher circles of society in the metropolis. Every year he attained a greater proficiency in his art; but though commissions for portraits to a considerable extent flowed in upon him, his pecuniary affairs were far from affluent. The drafts upon his purse, in behalf of his parents, were absorbing; but although this burden long held him down, he was never heard to murmur or complain. In 1791, he was elected an associate of the Royal Academy; in the following year, on the death of his former patron Sir Joshua Reynolds, he was appointed his successor in the offices of painter to his Majesty and to the Dilettanti Society. From this time his reputation grew steadily till he came to be generally considered the first portrait painter of the age. Every year he produced portraits of eminent characters, and his works included pictures of most of the crowned heads in Europe. In April 1815, the Prince Regent was pleased to confer the honour of knighthood on Mr Lawrence. At the request of the prince he was induced to proceed to Aix-la-Chapelle, to take likenesses of the most distinguished statesmen who had there met for diplomatic purposes; having executed this mission, to proceed to Vienna, and from thence to Rome, where he had an opportunity of contemplating the great masterpieces of ancient art. During the whole of Sir Thomas's residence on the Continent, he was entertained in the palaces of the various sovereigns with marked distinction; and the propriety and elegance of his deportment made an impression highly favourable to his character as an English artist and gentleman. He returned to England in 1820, but before his arrival, on the death of Mr West, he was elected without opposition to succeed him as President of the Royal Academy. This distinguished office he continued to hold till his lamented death. This event took place in a sudden manner on the 7th of January 1830, and was ascertained to have been caused by an extensive and complicated ossification of the heart—a disease which has prematurely cut off many men of genius.

It would be useless here to say any thing of the character of this eminent individual as a painter. His works, and engravings from them, are every where to be met with, and their superiority may be discovered even by the most ignorant, from their extraordinary delicacy of touch and gracefulness. He was one of the few eminent English painters who attained a proficiency in their profession before visiting Italy, or without studying the old masters—a circumstance attributable to his wonderful native genius and good taste. Although he never had to contend with those difficulties at the outset which have frequently beset the early career of men who arrived at distinction, his biography presents us with the instructive example of a man of genius successfully struggling to support a father's family, and who was neither intoxicated with applause nor abandoned to that recklessness of conduct which is too commonly found the concomitant of genius, especially when not strengthened by a good education in youth. But we will remember that although Sir Thomas's father was a *downdraught*, his mother was a woman of considerable intelligence and of many lady-like qualifications, as well as matronly virtues; and to her he no doubt owed much of that steadiness of principle which carried him so successfully through life.

LANDING IN AFRICA.

In an interesting work, entitled "Sketches of Spain and Morocco, by Sir Arthur de Capell Brooke, Baronet," the accomplished author presents us with the following account of his first landing on the shores of Africa, and the manners of the Moorish population at Tangier, a town on the coast of the Mediterranean, nearly opposite Gibraltar:—

"On approaching the African shores, the aspect of the mountains was desert in the extreme, and the country appeared totally uncultivated, and partially covered with brushwood. As we approached Tangier, the town presented an appearance novel and striking in the highest degree, forming an amphitheatre picturesquely broken by the mosques and high towers of the consular houses, and crowned by the lofty battlements and irregular turrets of the castle commanding the whole. At three o'clock, seated astride on the brawny neck of a Morocco Jew, I made my triumphant entry through the surf, and was landed safe and sound, for the first time in my life, in Africa. The acting consul-general, Mr Ellis, was down on the beach to receive me; and his influence, seconded by the weighty arm of the captain of the port, a sturdy Moor, which fell heavily upon the shoulders of troops of inquisitive wretched-looking Jews, brought me safe through the crowds that were assembled to look at me.

Cockney travellers, on passing from Dover to Calais, are oftentimes pleased to manifest their wonder at the marvellous alteration exhibited to their eyes. The person, however, who for the first time exchanges the shores of Europe for those of Barbary, may well be allowed to express his feelings of surprise at the new and extraordinary scene so suddenly presented to his view. A very few hours' sail has carried him from Europe to the vast and mysterious continent of Africa, from the midst of civilization into barbarism; and, from being surrounded in the morning by Christians, he finds himself in a crowd of Mahometans. The order of things is completely reversed, and every object appears to him novel and strange in the highest degree. The change is indeed so striking, that you may almost imagine yourself to have been transported at once to Timbuctoo; so wretchedly barbarous and so truly African does every thing appear to the eyes of the Christian stranger.

Tangier is a good specimen of a Moorish town. While you view it from the bay, it looks fair and inviting, and, it may be said, almost magnificent: when you enter the walls, however, the illusion ceases, and you can hardly believe your own eyes at the woful falling off in the aspect of things. The principal, and indeed the only one that can be called a street, and which intersects the town in an irregular manner from east to west, consists of a miserable collection of houses, the meanness of which is made more conspicuous by the almost splendid appearance of one or two of the consular houses. Near these the street opens into an oblong space forming a kind of market-place, one side of which is occupied by a low range of shops, or rather stalls, where fruits and different articles of grocery are sold.

One would have expected, in a street inhabited by the representatives of the European powers, to have found the pavement at least passable, whatever might be the case in other parts of the town. This is, however, hardly the case; and the Christians in this instance seem to be as regardless of their own comfort and safety as the Mahometans, for a more villanous piece of paved or unpaved road is or was not, when I was there, to be found in any part of the dominions of the sovereigns either of Morocco or Spain. From this principal street, as I have described it, numerous others branch off, winding round the town in all directions. Whilst slowly picking your way through these, you are almost inclined to fancy yourself in some of the barbarous towns in the very heart of Africa. In order to touch the houses on both sides of you, there is no occasion to extend your arms very wide; or to raise them to any great height, to reach the flat roofs as you walk along. As for the doors, many of which are scarcely three feet in height, you wonder how any human being can get in, much less the gigantic body of a Moor.

The houses, which, with few exceptions, have but one story, form a small square, one side of which

consists of the entrance door and a wall, and the rest of three small narrow apartments destitute of windows, and merely receiving their light through an open arch which forms the doorway. From the courtyard, a flight of steps reaches to the roof, which constitutes a flat terrace of considerable thickness to keep out the rain. It is thus prepared: over the boards which form the ceiling, a layer of clay, about a foot in thickness, is well beaten down. This is covered by a coating of lime: another layer of clay then succeeds, and a thicker one of lime to form the outer surface, the whole being well beaten down and whitewashed several times."

Our traveller next visited the Alcassaba, or castle of Tangier, to pay his respects to the bashaw or governor. Returning from this visit, he continues, "as we descended the hill, an arched entrance, near the gates of the Alcassaba, pointed out the approach, as I was told, to the habitation of a saint. These gentry, whom I shall have occasion to mention hereafter, are as abundant at Tangier as elsewhere—a small white linen flag, or rag, stuck on a pole, denoting their abode, which no Christian is allowed to pollute with his presence, or even to approach. From the habitations of Moors, saints, and Jews, being indiscriminately mixed together at Tangier, it requires a residence of some time, and a perfect knowledge of the many little winding streets, to make oneself well acquainted with those in which you are not permitted to set foot; and it frequently happens, that after following one of these winding alleys for some time, you find you are in a cul de sac inhabited by Moors, by whom you are almost sure of being reviled should you chance to be seen. On this account, a stranger is always provided with a soldier to attend him whenever he stirs out.

In such a miserable place as Tangier, it might naturally be supposed that the most profound silence and tranquillity would reign during the night; quite the reverse; and a stranger, on his arrival, does not find it an easy matter to close his eyes, so incessant is the noise echoed through all parts. This is owing to the military patrol, who are stationed in different parts, and perambulate the town throughout the night, calling out the watchword; which, being repeated by the next, circulates in an instant through the whole of the place, and is repeated about every five minutes during dark. In vain the poor stranger tries to close his eyes, and, turning from side to side, wonders at the cause of the savage cries that he hears thus echoed. Through many a weary hour is he constrained to bear this uproar, when, towards dawn, the wretches who have been murdering his repose slink away, and for an instant his weary eyelids are closed by sleep. I say for an instant, for the cries of the night patrol have scarcely died away, when he is suddenly aroused by a loud sepulchral voice, whose unearthly tones appear to his drowsy senses to descend from the air: this is the muedden or crier, who, from the top of the mosque, calls out to the true believer to shake off sleep and repair to prayers. It is the universal custom in Morocco, the use of bells being unknown both in Barbary, and, I believe, in other parts of the world where the Mahometan religion is professed. According to its rules, every Mussulman must repeat his prayers five times during the day; and this injunction by no means adds to the repose of the inmates of the consular house, from its immediate vicinity to the great mosque.

Every morning, when it is still almost dark, the muedden ascends the tower or minaret, and begins to exclaim from the top with a loud stentorian voice, in order to wake and give notice to the inhabitants. Having ceased for a short time, he recommences, continuing his exhortation or prayer for nearly half an hour, while the people are dressing and preparing themselves for the mosque. A third time he commences, when they repair to the mosque, and the first prayers are repeated, it being now dawn. The second prayers, which are announced in a similar manner, take place at twelve o'clock. The third time the muedden cries is nearly two o'clock; the fourth time, at gun-fire or sunset; the fifth and last prayers being announced at the close of day, and when the last gleam of light has disappeared on the horizon.

From the foregoing circumstances, it will be easily conceived, that, however agreeable and quiet Tangier may be during the day, it is not so during the hours when one feels most inclined to repose. A powerful addition to these miseries might well be enumerated in the never-failing lungs of one of those personages whom the besotted ignorance of the people dignifies by the name of saints, and who is one of the curiosities of Tangier. This holy man, who is easily recognised by his uncovered head, his filthy raiment, and a long staff with the aid of which he slowly perambulates the streets, is distinguishable from other saints by a loud peculiar bellowing, which is so strange and incessant as to induce some to suppose that it is the howling of an evil spirit which by some means or other has got possession of the good old man's inside. At cock-crow his daily roarings commence, usually stationing himself at the door of the fondâk or caravansery, which is a short distance above the English house. The utmost respect and obedience are paid by the Moors to this old madman, who acts in some respects with considerable method and forethought. Every market day he makes his appearance in the sók, provided with a capacious basket, which he fills at the different stalls with whatever pleases his fancy best, and for which payment is never demanded. It is amusing enough to see how well the holy man forages for himself: from one he takes a piece of meat, from another bread, from a third vegetables, until at last, having got sufficient to stop the throat of his noisy companion within him, he makes a quiet and orderly retreat.

The law here is administered with little form: the judge hears the different causes and suits frequently in the open street, and sitting probably at the door of some shop, where the respective parties plead their own causes before him; and the point in dispute is at once decided in a manner rather more expeditious than in our Court of Chancery, and as summarily as a country bench of magistrates disposes of a question of rates or a settlement case. Matters, however, are often left to be determined by arbitration. The usual punishment is the bastinado, which is so unsparingly administered upon all ranks and orders, that it may be considered indeed the birthright of a Moor. Arising out of this little instrument, three general divisions or classes of society exist in Morocco, as I have heard it observed: first, the sultan; secondly, those who beat; and, lastly, those who are beaten; the latter class always living in hopes to advance in life, and change places with the one immediately above them; a pithy arrangement, but very significant of the people and country.

Beheading prevails in cases of criminal delinquency; and in this operation the Moors are as expert as their other Mahometan brethren. The sufferer being thrown on his back on the ground, his legs and arms are held steady, while the operator, by means of a long sharp knife, removes the head, with a quickness and dexterity attained by practice alone; when in the hands of a novice, some hacking, as I have been told, naturally occurs. Decapitation, indeed, is so usual in Morocco, that it is thought little of; and a body is shortened with as much unconcern and ease as an Englishman slices off the head of a turnip. In many countries men's heads are their own; in this they belong to the sultan, before whom every Moor, proud and haughty as he may appear, crouches with the most abject slavery, in token of his being master of his life, and every thing he possesses."

A sketch of the manners and customs of the people of this interesting portion of Africa will be given in a succeeding number.

SCOTTISH PROBATIONERS.

THERE is a very general ambition among the lower order of the Scotch people, founded on the most laudable points of their character, to rear one of their family to be a clergyman. The English would be astonished if they knew what poor people north of the Tweed will do to attain this object—how shepherds, and small tradesmen, and coachmen, will sometimes contrive to obtain a learned education for one of their children, who perhaps gladdens their eyes before they die, by appearing in a pulpit, and fixing himself in one of the most respectable stations in life. No doubt, the wonder is lessened, in some measure, by the extreme cheapness of education in Scotland, and the expedients which are open to students for procuring their own support as they advance. Yet, after making every allowance, it must still be held as an extraordinary, and, in a national point of view, a creditable thing, that the bulk of the members of one of the learned professions of the country should be derived from a class of society almost the poorest which it possesses.

Praiseworthy, however, as we may allow the spirit to be, which induces a poor man in Scotland to make himself a great deal poorer, in order that one of his children may hereafter be a credit to him, and fill a high sphere of usefulness in his country, we cannot see that there is any abstract good in the Scottish clergy being so generally the children of poor men. It would be quite as well, we think, judging the question upon principles of general humanity, if clergymen were to arise from a class who could afford the education of their children with somewhat less of suffering, leaving the poor people to bring up their offspring to pursuits which would demand a smaller sacrifice of their own comfort. There is no reason in the world that a parent should pinch himself all his days, and abstract part of the comfort due to his other children, in order that *one* may hereafter be in the situation of a gentleman, while he and his remaining offspring still continue in their original humility. It is easy to see that there is a partiality and a wrong in this, which there is nothing on the other hand but a gratified sentiment to compensate. Nor is there any reason in the world that one man should wade through misery to a situation which another can attain without any misery. The privations of the Scottish theological students are in many cases dreadful—as would be the sufferings of any other persons of a humble rank, who should endeavour to step into any situation equally different from their original, and equally difficult to be attained.

All this, however, proceeds upon the assumption that the situation is sure in the long-run to be gained. If it were so, there might be more feasibility in this strange ambition of the common people. But, unfortunately, there is such a disproportion between the number of livings in the Scottish church and the number of those who are educated for the profession, that, for one who is successful, perhaps two are otherwise. The livings are about a thousand, of which thirty, at an average, become vacant every year. As four years is the period of theological education, it follows that little more than a hundred and twenty young men should ever be at one time in preparation for the profession. Now, it is far within the mark to assign five times this number as the amount of theological students in the various universities. The consequence is, that a vast number of young men are brought into a most delicate, anomalous, and painful situation in life, unable to obtain the employment for which they were reared, and equally powerless to adapt themselves to any other, except, perhaps, the business of teaching, which is more meanly paid than the humblest of the arts. "Exactly twenty years ago," says a friend at our elbow, "I was completing my classical course with a young man, the son of a very poor person, who was destined for the church. For twelve years, I have been in a way of supporting myself, and am now in a position in life with which I have every reason to be satisfied. What has been the fate of my school-companion? Owing to the narrow circumstances of his parents, his education was protracted through twice the number of years that would otherwise have been necessary. About nine or ten years ago, he was at length able to obtain a licence as a preacher, but not before he had undergone sufferings and difficulties such as could have never been his fate, if he had chosen a course of life more suitable to his native circumstances. Nor was the licence to preach an end to his distresses. He has since then found no better employment than to live with a very small gentleman as tutor to his children, upon a salary which scarcely keeps up a decent wardrobe. With the greatest personal worth, he possesses respectable abilities; yet such is the difficulty of obtaining a clerical location, that he may yet hang on for years before he obtains one, and, after all, may have to sink into the forlorn condition of a country schoolmaster, or try to find a congregation among the backwoods of America. He appears in my eyes in no other light than as a person who has lost his proper place in the world, and never been able to find another. The whole flower of his life is past, without having been either enjoyed or usefully employed; and even should he now become fixed in a clergyman's salary (seldom great at the best in this quarter of the island), what a deduction would need to be made to compensate for the years he has lost!"

Such is a single instance, but it is one which every reader will be able to multiply from his own recollections. It is in reality the case of a vast proportion of the young men reared in this country for the church; and it is one which every good mind must contemplate with regret. A multitude of young men of good abilities, who in other circumstances would have been benefiting the community, and securing their own prosperity and happiness, are left in the most distressing and hopeless situation, a burden to themselves and all connected with them.

Considering this as an evil of some magnitude in our country, and one which calls for correction, we have thought it consistent with the aims of our humble sheet, to convey the above remarks to the minds of the common people, in order that they may be induced to pause, before giving way to even those laudable feelings which are so apt to lead them into a course pregnant with mischief to themselves and others. If they are chiefly inspired with a wish that a child of theirs should be concerned in the great business of enforcing religious precepts, they ought to consider if they are sure that an opportunity to do so, will, under present circumstances, be allowed to him. If the temporal advantage and respectability of a clerical situation be what chiefly animates them, they would do well to consider if equal advantages may not be gained at a less sacrifice of immediate comfort. A parochial minister has certainly something like a competency for current subsistence; and the dignity of his profession raises him considerably above that degree of public respect which the same income would gain in any other situation. The clergyman, however [we speak of Scotland only], has no means of extending his income, so as to provide for the settlement of his family, or for any other of those purposes to which the most natural and justifiable feelings might prompt him. We every day see men, whose education has cost little or nothing, and whose origin is the meanest, rise by trade to the enjoyment of an excellent income, and eventually accumulate immens wealth. The chances, indeed, in almost any course of life that an adventurous and able young man can enter into, are infinitely better than those of the

church. There is also a kind of grudge in the minds of a large class of the people respecting even the moderate incomes which the clergy enjoy, and to which no layman, however wealthy, or however discreditably he may use his wealth, is ever subjected: this, with a mind of any sensibility, must greatly detract from that comfort which is supposed to reside in a manse. It would, therefore, we think, be well for the individuals who are anxious to educate their sons for the church, to weigh well beforehand three questions—Is the situation temporally better than others which can be gained at less expense, and with less discomfort? Is there a good chance of the situation being gained after all the qualifications have been accomplished? Is it not better, since there is such difficulty in a poor person obtaining these qualifications, to permit some richer one to take the risk? Unless these questions can be satisfactorily answered, they are only sacrificing, to a vain excess of a laudable sentiment, their own welfare, and that of their children.

THE RIFLE,

AN AMERICAN TALE.

About the middle of December, some ten or twelve years ago, before Illinois was admitted a sister state into the union, on the afternoon of a day that had been uncommonly severe, and during the morning of which there had occurred a light fall of snow, two persons were seen riding along one of the immense prairies, in a northern direction. The elder seemed advanced in years, and was dressed in the usual habiliments of the country. He wore a cap made of the skin of the otter, and a hunting-shirt of blue linsey-wolsey covered his body, descending nearly to the knees, and trimmed with red woollen fringe. It was fastened round the waist by a girdle of buckskin, to which was also appended a bullet-pouch, made of the same material with the cap. His feet were covered with buckskin mocassins, and leggings of stout cloth were wrapped several times round his legs, fastened above the knee and at the ancle with strings of green worsted. The horse he bestrode was so small, that his rider's feet almost draggled on the ground, and he had that artificial gait which is denominated rocking. The old man's hair fell in long and uncombed locks beneath his cap, and was white with the frosts of many winters; while the sallowness of his complexion gave proof of a long residence in those uncultivated parts of the country where the excessive vegetable decay, and the stagnation of large bodies of water, produce perennial agues. His companion was a young man, dressed according to the prevailing fashion of the cities of the eastern states, and his rosy cheeks, and bright blue eyes, evinced that he had not suffered from the effects of climate. He was mounted on a spirited horse, and carried in his hand, the butt resting on his toe, a heavy-looking rifle.

"Well, Doctor Rivington," said the elder person, "I should no more ha' looked to see one of you Yankees taking about wi' you a real Kentuck rifle, than I should ha' thought I'd be riding myself without one. If I did'nt see it in your hands, I could almost swear that it's Jim Buckhorn's."

"You have guessed correctly, Mr Silversight," replied the young physician; "I believe you know almost every rifle in this part of the territory."

"Why, I have handled a power of 'em in my time, doctor," said the old man; "and there a'n't many good ones atwixt Sangano and the Mississip', that I don't know the vally on. I reckon, now, that same rifle seems to you but a clumsy sort of shooting-iron, but it's brought down a smart chance of deer, first and last. That lock's a rail screamer, and there a'n't a truer bore, except mine, that I left down in the settlement, to get a new sight to."

"I was unacquainted with the worth of the gun," resumed Charles Rivington; "but stepping into the gunsmith's this morning, I heard him lament that he had missed a chance of sending it out to Jimmy Buckhorn's; so, intending to come this way, I offered to take charge of it myself. In this widerness country, we must stand ready to do such little offices of friendship, Mr Silversight."

"'Twas no doubt kindly meant, doctor, and Jim will be monstrous glad to git his piece agin," said the hunter. "But my wonderment is, and I don't mean no harm by it, how that tinker would trust such a screamer as that 'ere with a Yankee doctor. Do give it to me; I can't 'bide seeing a good rifle in a man's hand that don't know the vally on it."

Dr Rivington resigned the weapon with a good-humoured smile; for he had been some time in the country, and partly understood the love which a hunter always feels for a piece of the character of that he had been carrying; he knew, too, though the old man's manners were rough, there was nothing like roughness in his heart. Indeed, the very person who was loath to trust his young companion with a gun, intrinsically worth but a trifle, would, nevertheless, as we shall presently see, have unhesitatingly placed in his charge, without witness or receipt, an uncounted or unlimited amount of money. Handing his rifle across his horse to the old hunter, Charles Rivington observed, "I am glad you have offered to take it, Mr Silversight, for there appears to be a storm coming up, and, as I wish to reach Mr Wentworth's to-night, I can make the distance shorter, by crossing through the timber into the other prairie, before I get to Buckhorn's."

"Will you be going to town to-morrow, doctor?" asked Silversight.

"I shall."

"Well, then, you can do me a good turn. Here," said the old man, handing a little leathern bag, "is fifteen dollars in specie; and the rest, four hundred and eighty-five in Shawnee-town paper, is wrapped in this bit of rug. Want you to pay it into the land-office, to clear out old Richly's land: I was going to take it in; but you'll do just as well, and save me a long ride."

The physician promised to attend to the business, and they kept on together, conversing about such subjects as the nature of the scene suggested, until they reached the place where the path, dividing, pursued opposite directions.

"This is my nearest way, I believe?" said Charles.

"It is," answered the old man. "This first track, that we noticed awhile ago, lies on my route; so I'll push my nag a little, soon as I load this rifle, and it may so be that I'll overtake company. Doctor, look here, and you'll know how an old hunter loads his piece—it may stand you in stead some day; I put on a double patch, because my bullets are a leetle smaller than Jim's, you mind I told you. There," said he, as he shoved the ball into its place, and carefully poured some priming into the pan, "it's done in quick time by them what have slept, year in and year out, with Red Indians on every side of 'em. Good night to ye, doctor; you needn't lift the certificates—the register may as well keep 'em till old Richly goes in himself."

So saying, the two travellers parted, each urging his horse to greater speed, as the night threatened to set in dark and stormy. The old hunter had proceeded about four or five miles on his way, when the report of a musket was heard reverberating through the night, and the old man, writhing and mortally wounded, fell from his horse, which, scared by the occurrence, ran wildly over the prairie. A form was seen a few minutes after, cautiously approaching the place, fearful lest his victim should not yet be dead; but apparently satisfied in this particular, by his motionless silence, he advanced, and proceeded immediately to examine the pockets of the deceased.

"So!" muttered he at length, when a fruitless search was finished, "the old curmudgeon has'nt got the money after all; and I've put a bullet through his head for nothing. I'm sure I heard him say, in Brown's tavern, down in the settlement, that old Richly gave it to him to carry; well, it's his own fault, for telling a bragging lie about it; and the grey-headed scoundrel won't never jeer me again, for using a smooth-bore, before a whole company of Kentuck-squatters—it carried true enough to do his business. I'm sorry I dropped that flask, any how; but this powder-horn will make some amends," grumbled the wretch, as he tore the article he spoke of from the breast where it had hung for forty years. "What have we here!" said he again, as he struck his foot against the rifle that the murdered man had dropped; "ho, ho," discharging it into the air, "if the worst comes to worst, they'll think his piece went off by accident, and shot him. But there's no danger—it will snow by day-light, and cover the trail, and the prairie wolves will finish the job."

Thus muttering, the ruffian remounted the animal he held by the bridle, and trotted across the prairie, nearly at right angles with the path along which the unfortunate hunter had been travelling.

It was in a log-house, larger, and of rather more comfortable construction, than was usually seen in that wilderness country, beside a fire that sent a broad and crackling flame half way up the spacious chimney, that there was seated, on the evening of this atrocious murder, in addition to its ordinary inmates, the young physician from whom we have lately parted. His greatcoat, hat, and overalls, were laid aside, and he was conversing with that agreeable fluency, and pleased expression of countenance, which denoted that he was happy in the society around him. Opposite, and busily employed in knitting, sat a beautiful girl of eighteen. From her work, which seemed to engross an unusual portion of her attention, she every now and then would send a furtive glance to their guest, thus telling, in the silent language of love, the tale she never could have found words to utter.

Catharine Wentworth was the daughter of a gentleman who had formerly been a wealthy merchant in the state of New York, but to whom misfortune in business had suddenly befallen, and had stripped him of all his fortune. Not caring to remain longer among scenes that continually brought to mind the sad change in his condition, he emigrated with his family to the wilds of Illinois. In a plain log-cabin he now enjoyed a degree of happiness that he had never known before. And well might he be happy, for his wife, two hardy and active sons, and his daughter Catharine, were all around him, smiling in contentment, and ruddy with health.

This happy family, with the addition of Charles Rivington, who was already betrothed to his dearly beloved Catharine, were gathered, as we have said, round the fireside, conversing cheerfully, when a light tap was heard at the door, and Mr Rumley, the deputy sheriff of the county, entered the apartment, apologising for his intrusion by saying he was on his route for a cabin farther up the prairie. He was by no means a person of prepossessing look, and on the present occasion wore a haggard appearance; but he was welcomed to the cottage, and accommodated with a lodging for the night. In a short time the different members of the family retired to rest.

It was late on the following day that Charles Rivington, being returned to the town where he resided, was seated in his office, employed in counting a roll of notes, a pile of dollars lying at the same time on the table before him, when three men abruptly entered the apartment.

"You are our prisoner," cried the foremost of the party. "Look there, Jim; there's the very money itself. I can swear to the pouch."

"Stand back, sir, and lay hold of me at your peril," replied our hero; "if I am to be made prisoner, produce your warrant."

"You may as well submit, doctor," said Buckhorn, another of the party; "you are accused of being the murderer of old Silversight, who was found shot through the head on the road this morning."

"Is it possible? Poor old man! has he really been killed? When I parted with him last night, he was not only well, but seemed in excellent spirits. However, I yield myself your prisoner. I perceive there are some circumstances that cause suspicion to rest on me. I must rely, for a while, upon the character which, I trust, I have acquired since my residence among you, for honour and fair dealing, until I shall be able to prove my innocence, or till the real perpetrator is placed in the hands of justice."

So saying, Charles Rivington departed with the officer and his companions to the house of Mr Lawton, who, being a justice of peace, had issued a warrant for his apprehension. It is needless to say any thing of the examination. Our hero was committed for trial, and so strong were the proofs against him, that the worthy magistrate, and indeed the whole neighbourhood, could scarcely hesitate to believe him guilty. When the sun arose that morning, Charles Rivington was one of the happiest of men. Loving and beloved, his business increasing, his name respected, and the time rapidly approaching which was to bind him to his Catharine in the tender relationship of marriage—he looked back upon the glorious orb, as it burst through the eastern heaven, with an eye of almost kindred brightness. How changed the scene at its setting! Its last rays fell upon him through the iron-guarded window of a prison: but he was invigorated by conscious innocence. The only son and support of a widowed mother, he had been endowed with good principles, and now was deeply troubled at the distress she would experience on his account. Information was soon conveyed to the excellent woman of the unhappy fate of her boy, and she hurried to visit him in his confinement: the meeting was such as will be easily imagined.

To proceed: week after week rolled by, and the day appointed for the trial at length arrived. The little village in which the sessions of the circuit-court were held, contained about fifty or sixty houses, most of them constructed of logs. There was an open space in the midst of it, termed "the Public Square," in which stood a building, answering the double purpose of court-house during sessions, and of a meeting-house when an occasional missionary passed through that part of the country. The jail occupied a corner of the same place. It was a small one-story edifice, about twelve feet square, and built of hewn logs, fastened together with iron bolts at the corners. Its single apartment contained but one door and window, both secured by strong bolts and bars. Here lay the hero of our story till his trial took place.

The trial of Charles Rivington for murder excited a great deal of attention in this remote district, and on the important day the court-house was crowded. Among the witnesses who were examined was one Carnock, the nephew of the deceased. He mentioned, that, on the night of the 16th of December, he was surprised to see the horse of his uncle arrive, with saddle and bridle on, but without a rider. He thought that the deceased had stopped perhaps for a while at Buckhorn's, who lived at the distance of a mile or so; but as the night passed away without his returning home, he started early in the morning with the intention of tracking the horse. He called for Buckhorn, and they got upon the trail, and followed it till they found the dead body. It led them to Mr Wentworth's. They inquired if any person had been there who had crossed over from the other side of the stream. They were answered, that Dr Rivington had crossed the stream, and remained the night with them; that Mr Rumley, the deputy-sheriff, had also remained the night, but that he had come from farther up on the same side. They followed on the trail till they arrived in the town. Being informed by Mr Drill the gunsmith, that Dr Rivington had taken Buckhorn's rifle out with him, they immediately procured a warrant for his apprehension. They found him employed in counting the identical money which had been taken from the unfortunate Silversight.

Other witnesses were examined, and the prisoner was put on his defence; and all that talent or ingenuity could devise was done by skilful counsel. A large number of respectable persons came forward to testify to the excellence of our hero's general character; but their evidence was rendered unnecessary, by the attorney for the prosecution admitting, in unequivocal terms, that, previous to the horrid occur-

rence, it had been exemplary in a high degree. Summing up very briefly, he assured the jury that the evidence was so clear in its nature, so concatenated, so incontrovertible, as to amount to a moral certainty. Near the body of the murdered man, a powder-flask had been found, with the initials of the prisoner's name and medical degree engraved upon it—C. R. M. D.—Charles Rivington, Doctor of Medicine; and that this was a point in the evidence of the most conclusive kind.

The charge of the judge, who was evidently much affected, occupied but a few minutes, and the jury retired to make up their verdict. The prisoner, in the meanwhile, sat firm and collected, though pale, in consequence of sickness, produced by his situation in a nauseous confined prison. Let us hurry over this distressing scene. The prisoner, as was anticipated, was pronounced guilty, and doomed to perish on the gallows as a malefactor that day three weeks. The intense anxiety, and at length the horror of mind of the mother of this unhappy victim of circumstantial evidence, and of the sorrowing, almost distracted Catharine, both of whom waited with impatience the termination of the trial, it would be impossible to describe.

The three weeks which had been allowed before carrying the sentence of the court into effect, elapsed. The morning which our hero believed was to be the last of his earthly existence, rose with unwonted brightness; and throngs of people came pouring into the little village, impelled by curiosity to witness the appalling spectacle. The hour now arrived when Charles Rivington was to suffer the sentence of the law. A rude gallows was erected at about a quarter of a mile from the public square, and thither the sad procession moved. He was decently dressed in a black suit, and walked to the fatal spot with a firm step. He was very pale; but from no other outward sign might the spectator guess that he shrunk from the horrors of such a death. They reached the spot, and a prayer was offered up with unaccustomed fervour. The sheriff's attendant stood in waiting with the fatal cord; while the agonised mother, vainly endeavouring to emulate the firmness of her heroic son, approached with trembling steps to bid a last farewell—when, hark! a shout was heard—all eyes were turned to catch its meaning—another shout, and the words, "Stop the execution!" were distinctly audible. In an instant after, the death-pale form of Jimmy Buckhorn tumbled from his horse, with just sufficient strength remaining to reach towards the sheriff, with an order from the judge to stay the execution.

Jimmy Buckhorn had deeply lamented the fate of Charles Rivington, and, though at first bearing witness against him, felt a conviction of his innocence, and sought for some clue to the real murderer. For some time he was unsuccessful; but at length the thought struck him that the track in the side of the stream where Mr Wentworth resided might have been caused by a traveller passing along on the morning after the fatal deed, and the deputy-sheriff, in that case, might be the real culprit. He immediately set out to visit every cabin above Mr Wentworth's, to see if Rumley's story of having been farther up the stream was correct. This took a considerable time; but the result satisfied him that the tale was false. He then procured the assistance of a surgeon, imposing upon him secrecy until the proper time for disclosure; and proceeded to disinter the body of Silversight. This was more successful than he had dared to hope: the ball had lodged in a cavity of the head, and being produced, Buckhorn pronounced at once, from its great size, that it could have been discharged only from Rumley's smooth-bore. He set out directly in search of the deputy-sheriff, whom, with his gun, he happily secured at one of the taverns in the new settlements, and thereupon lost not a moment in fleeing to the house of the judge to procure an order to delay the proceedings against the unoffending Rivington.

But the chain of evidence in this extraordinary case was not yet complete. A wild and dissipated young man, of the name of Michael Davis, who had just returned up the river from New Orleans, entered the office of the clerk of the county, on his way back from the place where the execution was to have taken place. Here he saw lying on the table the fatal powder-flask which had been brought in evidence against our hero, and which he proved to have been his own, "or rather," said he, "it was mine and Caleb Rumley's together; there's our initials C. R. M. D. for Caleb Rumley and Michael Davis, scratched on one of the sides with my own knife." Immediately on this wonderful development of Rumley's connexion with the murder, no one continued to hold the unfortunate Rivington any longer guilty; and it became the duty of the worthy magistrate to commit, in the course of that very day, that respectable personage Caleb Rumley, Esq. to the same tenement which Dr Rivington had lately inhabited. A bill was forthwith found by the grand jury, and the trial of the real murderer came on shortly after. For a long time he obstinately denied any knowledge of the death of Silversight; but as proofs after proofs were disclosed against him, he first became doggedly silent, then greatly intimidated, and at last made a full disclosure of his crime. He was accordingly found guilty, and executed on the same gallows that had been erected for our calumniated hero.

The sickness of Catharine Wentworth was long and severe; but our friend Charles was her physician, and the reader will not wonder that it yielded at last to his skill. The excellent parent of our hero had been condemned, at different periods of her life, to drink deeply of the cup of affliction, and she had bowed with noble humility to her fate; but she now supported herself in this more trying hour of joy. As for her severely-tried son, he was now restored to the affections of all who knew him: his character was held in higher estimation than ever. Spring had gone forth, warbling with her thousand voices of delight, over those wide-extended prairies, and the flowers had sprung into a beautiful existence at her call, when the hand of the blushing Catharine, herself a lovelier flower, was bestowed in marriage on the transported Charles Rivington.*

* Abridged from a series of American tales, edited by Miss Mitford.

NEW YEAR OBSERVANCES IN SCOTLAND.

Except in some parts of the Highlands, where the day of the Nativity is still marked with some show of decent observance, the Scottish people may be said to have no holidays besides the first and last days of the year, and an anomalous festival called Handsel Monday. Easter and Christmas were no doubt observed in Scotland, before the Reformation, with the same pious regard as elsewhere. But after that period, when, as some one remarked, we made so much haste to escape from Rome, as almost to run out of Christendom, those festivals were denounced as Popish; nor even in the partially triumphant days of Episcopacy was it found possible to induce an observance of them. In a religious point of view, Christmas and Easter are totally unknown among us, except to Episcopalian families. To make up for this, however, we celebrate the close of the one year and the opening of the other with such intense mirthfulness, that the whole period is called, *par excellence*, the Daft Days.

Christmas, it must be acknowledged, partakes a little of the general character of the Daft Days. It is honoured with a shadowy and traditionary notice among the peasantry, the remains of a respect which has long gone by. The guizards, for instance, always look upon it as the first of those nights when it is lawful for them to go about in the exercise of their calling. We may also learn, from several popular rhymes, that it is either still, in some places, a day of feasting, or is recollected to have been so in times past. Thus, the boys in the old pastoral town of Peebles have a rhyme which they cry during the Daft Days, as they go about the streets:

"On Chrisslemass nicht I turned the spit,
I burnt my finger, I find it yet!"

And in Fife they have a rhyme still more pointedly testifying the festive character of the day—a rhyme breathing a fine spirit of mingled gratitude and regret for past pleasures:

"Yule's come, and Yule's gane,
And we hae feasted weel;
Sae Jock maun to his flail again,
And Jenny to her wheel."

Scotland has also in its time partaken of the old religious rites with which Christmas used to be celebrated at the peasant's fireside. The boys are still well acquainted with the rhyme alluded to in Ellis's edition of Brand's Popular Antiquities, as having been descriptive of, or allusive to, a certain domestic ceremony:

"Yule, Yule, Yule,
Three puddings in a pule!
Crack nuts and cry Yule."

These are curious memorials of the Scottish Christmas or Yule, and tend to illustrate the remark of Coleridge as to the difficulty of altogether erasing the marks of "that which once hath been." They show that even a high religious principle may fail to extinguish the humblest and homeliest custom, if it once be a custom, and have any recommendation from the universal taste for amusement. Old Scottish ballads allude to the hallow or holidays of Yule:

"When the hallow days o' Yule were come,
And the nichts were lang and mirk,
Then in and came her ain twa sons,
And their hats made o' the birk."

There is also some illustration of this point to be derived from a child's rhyme; which, being redeemed from silliness by a good moral, may also be placed amidst these frail vestiges of an observance almost forgotten:

"There was a guse, they ca'd it Luce,
Was paidling in a pool-y,
By cam a tod, wi' mony a nod,
And bad her to hir Yule-y.
He took her hame, and thocht nae shame
To put her on a stool-y,
Then singit her claes, and burnt her claes,
And gar'd her look like a fool-y."

And such will be the fate of all silly geese, which trust too much to the courteous invitations of wily tods.

But we hasten from Christmas to Hogmanay—from the shadow to the substance. Hogmanay is the universal popular name in Scotland for the last day of the year. It is a day of high festival among young and old, but particularly the young, who do not regard any of the rest of the Daft Days with half so much interest. In the town above mentioned, which, being quite secluded from other places, maintains old customs in considerable purity, the children of the poorer people—all of them, without exception of sex or age, if only able to walk—get themselves, at an early hour, tied into large aprons or sheets, the lower corners of which are turned up in front, so as to form each into a vast pocket or refectory. Thus rigged out, they go in families or bands to the doors of all the better sort of people, to collect an alms of oaten bread, from time out of mind accustomed to be given on this day by the rich to the poor. Each child gets one quadrant section of oat-cake (sometimes, in the case of particular favourites, improved by an addition of cheese), and this is called their *hogmanay*. In expectation of the large demands thus made upon them, the housewives busy themselves, for several days beforehand, in preparing a suitable quantity of cakes. A particular individual, in my own knowledge, has frequently resolved two bolls of meal into hogmanay cakes. The children, on coming to the door, cry "Hogmanay!" which is in itself a sufficient announcement of their demands; but there are other exclamations, which either are or might be used for the same purpose. One of these is,

"Hogmanay,
Trollolay,
Give us of your white bread, and none of your grey!"

What is precisely meant by the mysterious word *Hogmanay*, or by the still more inexplicable *Trollolay*, I shall not pretend to determine: but the reader will find, from the fourth volume of the Archæologia Scotica, that the subject has received due attention at the hands of the Society of Scottish Antiquaries. Of the many other cries, appropriate to the morning of Hogmanay, I may chronicle two of the less puerile:—

"Get up, gudewife, and shake your feathers,
And dinna think that we are beggars;
For we are bairns come out to play,
Get up and gie's our Hogmanay!"

Another is of a moralising character, though a good deal of a truism:—

"Get up, gudewife, and binna sweir,
And deal your bread to them that's here;
For the time will come when ye'll be dead,
And then ye'll neither need ale nor bread."

She is in a very peevish strain, but, as saith the sage, "Blessed is he that expects little, for he will not be disappointed:"—

"My shoon are made of hoary hide;
Behind the door I downa bide:
My tongue is sair, I daurna sing—
I fear I will get little thing."

The most favourite of all, however, is much smarter, more laconic, and more to the point, than any of the foregoing:—

"My feet's cauld, my shoon's thin;
Gie's a piece, and let us rin!

It is no unpleasing scene, during the forenoon, to see the children going laden home, each with his large apron bellying out before him, stuffed full of cakes, and perhaps scarcely able to waddle under the load. Such a mass of oaten alms is no inconsiderable addition to the comfort of the poor man's household, and tends to make the season still more worthy of its jocund title.

In the evening of this day, as on Christmas night, the guizards are all astir. Such of the boys as can pretend to any thing like a voice, have for weeks before been thumbing the collection of excellent new songs, which lies like a bunch of rags in the window sole, and being now able to screech up "Barbara Allan," or the "Wee Cot-house and the wee Kail-yardie," they determine upon enacting the part of the guizards. For this purpose they don old shirts belonging to their fathers, and mount casques of brown paper, shaped so like a mitre, that I am tempted to believe them borrowed from the Abbot of Un-reason: attached to this is a sheet of the same paper, which, falling down in front, covers and conceals the whole face, except where holes are made to let through the point of the nose, and afford sight to the eyes and breath to the mouth. Each vocal guizard is, like a knight of old, attended by a kind of "humble squire," who assumes the habiliments of a girl, with an old woman's cap, and a broomstick, and is styled "Bessie." Bessie is equal in no respect, except that she shares fairly in the proceeds of the enterprise. She goes before her principal, opens all the doors at which he pleases to exert his singing powers, and busies herself during the time of the song, in sweeping the floor with her broomstick, or in playing any other antics that she thinks may amuse the indwellers. The common reward of this entertainment is a halfpenny; but many churlish persons fall upon the unfortunate guizards, and beat them out of the house. Let such persons, however, keep a good watch upon their cabbage gardens next Halloween! Guizarding is proper to four nights of the year:—Christmas, Hogmanay, New-year's Day, and Handsel Monday. We observe it is tried in a small and unpretending way at Edinburgh.

It were unnecessary, in this place, to enter into an account of the practices at the midnight between Hogmanay and New-Year's-Day, which are already so minutely described in other works. Neither, for the same reason, is it worth while to particularise the customs of the first day of the year itself. I may only mention, that the custom of New-Year's gifts, still so rife in France, was formerly much more common in this country than it is at present. We find, for instance, from Mr Pitcairn's great work, that James the Fourth would have a gift of ten angels presented to him in his bed on New-Year's morning; as also a *caudle*, which, by the way, must have been exactly the same thing which the modern people of Edinburgh know by the term *het-pint*. It is pleasant also to find, that, on the 1st of January 1490–91, the same monarch presented Blind Harry, the minstrel, author of the "Life of Wallace," with eighteen shillings. Still more

delightful is it to know, that, on the New-Year's-Day of 1507, the monarch gave to diverse "menstrallis, schawmeris, trumpeteris, tabrounaris, fithelaris, luteris, clarshaaris, and piparis," the aggregate sum of forty-one pounds sixteen shillings. The custom of giving and receiving New-Year's gifts was still more common at the court of James the Sixth, who was exactly the kind of man to give encouragement to at least one branch of the system. We find Elizabeth also a great receiver of New-Year's gifts. And after James went to England, the practice had reached such a height, and was so indispensable, that it is grievously complained of as a tax upon the pockets of the courtiers.*

THE DOCTORED MONKEY.

A MELANCHOLY fate, I am sorry to record (says Captain Hall),† befel a monkey of mine. I was then in command of the Lyra, on the homeward voyage from China, after the embassy under Lord Amherst had been concluded. We touched on our way to Calcutta at the Philippine Islands, and, amongst other live stock, laid in a monkey which had seen the world. He was born, they assured us, at Teneriffe, bred at Cadiz, and had afterwards made the voyage across the Pacific Ocean, viâ Lima and Acapulco, to Manilla. This splendid bay is the chief station of the Spaniards in the eastern world, and has long formed one of those links in the vast colonial chain which enabled that once powerful nation to boast with truth that the sun never set on their dominions. Our extensive traveller had made good use of his time and opportunities, and was destined to see a good deal more of men and manners, indeed almost to make out the circuit of the globe. We brought him with us through the Straits of Malacca to Poolo Penang, and from thence carried him across the Bay of Bengal to Calcutta and Madras. We next visited together the Isle of France, the Cape, and, lastly, St Helena, at the very time the ex-emperor of the world resided there.

This distinguished monkey had a particular liking for the marines, who caressed and fed him, and sometimes even ventured to teach him to play off tricks on Jack, which the sailors promised one day to pay back with interest on the soldiers. In so diminutive a vessel as a ten-gun brig, there is but a small party of marines, merely a serjeant's guard, and no commissioned officer, otherwise I hardly think the following trick would have been attempted.

It has been already mentioned, that on Sundays the ship's company are mustered at divisions, ranged on either side of the deck. Every man is then dressed in his very best togs, shaved, and trimmed up as gaily as possible. The marines, of course, sparkle abaft as brightly as polished metal, scarlet cloth, and the eternal pipeclay, can make them. When all are reported present, the captain walks slowly and solemnly round, eyeing each man from head to foot, to detect a spot of dirt, or a thread opening at a seam, and peering under the breast of every gun to discover some neglected delta of unwashed-away sand.

One fine day, while going our formal rounds, I came to a figure which at first sight puzzled me not a little. This was no other than our great traveller the monkey, dressed up as a marine, and planted like a sentry on the middle step of the short ladder which, in deep-waisted vessels, is placed at the gangway, and reaches from the deck to the top of the bulwark. The animal was dressed up in a complete suit of miniature uniform, made chiefly of the coloured buntin used for flags, with sundry bits of red baise purloined from the carpenters. His regimental cap was constructed out of painted canvass; and under his lower jaw had been forced a stock of pump-leather, so stiff in itself, and so tightly drawn back, that his head was rendered totally immovable. His chin, and great part of the cheeks, had been shaved with so much care, that only two small curled mustachios and a respectable pair of whiskers remained. His hair behind being tied back tightly into a queue, the poor creature's eyes were almost starting from his head; while the corners of his mouth being likewise tugged towards the ears by the hairdresser's operations, the expression of his countenance became irresistibly ludicrous. The astonished recruit's elbows were then brought in contact and fastened behind by a lashing, passed round and secured to the middle step of the ladder, so that he could not budge an inch from his position. One of the ship's pistols, fashioned like a musket, and strapped to his shoulder, was tied to his left hand, which again had been sewed by the sailmaker to the waistband of his beautifully pipeclayed trousers; in short, he was rigged up as a complete sea-soldier in full uniform.

As the captain and his train approached, the monkey began to tremble and chatter; but the men, not knowing how their chief might relish the joke, looked rather grave, while, I own, it cost me no small official struggle to keep down a laugh. I did succeed, however, and merely said, in passing, "You should not play these tricks upon travellers; cast him loose immediately." One of the men pulled his knife from his breast, and cutting the cord which fastened the poor Spaniard to the ladder, let him scamper off. Unluckily for the gravity of the officers, however, and that of the crew, Jacko did not run below, or jump into one of the boats out of sight, but made straight for his dear friends the marines, drawn up in line across our little hurricane-house of a poop. Unconscious of the ridicule he was bringing on his military patrons, he took up a position in front of the corps, not unlike a fugleman; and I need hardly say, that even the royals themselves, provoked though they were, now joined in the laugh which soon passed along the decks, and was with difficulty suppressed during the remainder of the muster.

A day or two afterwards, and while the monkey was still puzzled to think what was the matter with his chin, he happened to observe the doctor engaged in some chemical process. As his curiosity and desire for information were just such as ought to characterise a traveller of his intelligence, he crept gradually from chest to chest, and from bag to bag, till he arrived within about a yard of Apothecaries' Hall, as that part of the steerage was named by the midshipmen. Poor Mono's delight was very great as he observed the process of pill-making, which he watched attentively while the ingredients were successively weighed, pounded, and formed into a long roll of paste. All these proceedings excited his deepest attention. The doctor then took his spreader, and cut the roll into five pieces, each of which he intended to divide into a dozen pills. At this stage of the process, some one called the pharmacopolist's attention to the hatchway. The instant his back was turned, the monkey darted on the top of the medicine-chest, snapped up all the five masses of pill stuff, stowed them hastily away in his pouch, or bag, at the side of his mouth, scampered on deck, and leaped into the main rigging, preparatory to a leisurely feast upon his pilfered treasures.

The doctor's first feeling was that of anger at the abstraction of his medicines; but in the next instant, recollecting that unless immediate steps were taken, the poor animal must inevitably be poisoned, he rushed on deck, without coat or hat, and knife in hand, to the great surprise and scandal of the officer of the watch.

"Lay hold of the monkey, some of you," roared the doctor to the people. "Jump up in the rigging, and try to get out of his pouch a whole mess of my stuff he has run off with."

The men only laughed, as they fancied the doctor must be cracked.

"For any sake," cried the good-natured physician, "don't make a joke of this matter. The monkey has now in his jaws more than a hundred grains of calomel; and unless you get it from him, he will die to a certainty."

This appeal, which was quite intelligible, caused an immediate rush of the men aloft; but the monkey, after gulping down one of the lumps, or twenty-four grains, shot upwards to the top, over the rail of which he displayed his shaven countenance, and, as if in scorn of their impotent efforts to catch him, plucked another lump from his cheek, and swallowed it likewise, making four dozen grains to begin with. The news spread over the ship; and all hands, marines inclusive, most of whom had never been farther in the rigging than was necessary to hang up a wet shirt to dry, were seen struggling aloft to rescue the poor monkey from his sad fate. All their exertions were fruitless; for just as the captain of the maintop seized him by the tail, at the starboard royal yard-arm, he was cramming the last batch of calomel down his throat!

It would give needless pain to describe the effects of swallowing the whole of this enormous prescription. Every art was resorted to within our reach in the shape of antidotes, but all in vain. The stomach-pump was then, unfortunately, not invented. Poor Jacko's sufferings, of course, were great:—First he lost the use of his limbs, then he became blind, next paralytic; and, in short, he presented, at the end of the week, such a dreadful spectacle of pain, distortion, and rigidity of limb, that I felt absolutely obliged to desire that he might be released from his misery by being thrown into the sea. This was accordingly done when the ship was going along for the British Channel.

LONG VITALITY OF SEEDS.

So completely is the ground impregnated with seeds, that if earth is brought to the surface from the lowest depth at which it is found, some vegetable matter will spring from it. I have always considered this fact as one of the many surprising instances of the power and bounty of Almighty God, who has thus literally filled the earth with his goodness, by storing up a deposit of useful seeds in its depths, where they must have lain through a succession of ages, only requiring the energies of man to bring them into action. In boring for water lately, at a spot near Kingston-on-Thames, some earth was brought up from a depth of three hundred and sixty feet; this earth was carefully covered over with a hand-glass, to prevent the possibility of any other seeds being deposited upon it; yet in a short time plants vegetated from it. If quicklime be put upon land which from time immemorial has produced nothing but heather, the heather will be killed, and white clover spring up in its place. A curious fact was communicated to me, respecting some land which surrounds an old castle, formerly belonging to the Regent Murray, near Moffat. On removing the peat, which is about six or eight inches in thickness, a stratum of soil appears, which is supposed to have been a cultivated garden in the time of the regent, and from which a variety of flowers and plants spring, some of them little known even at this time in Scotland.—*Jesse's Gleanings of Natural History.*

A HIGHLAND TRADITION.

Near the middle of the vale of Glen Urcha, in Argyleshire, the traveller will perceive a small eminence, entitled by the people of the district the Gallows Hill, and which is now an object of traditionary legend. When the clan Macgregor was in possession of this part of the country, this mount was the ordinary place of execution; and the gallows, from whence it took its name, is said to have stood on a small knoll upon its summit. Among the various tragic tales told of the fate of those condemned by the feudal jurisdiction to suffer on this spot, the following is one sufficiently illustrative of a system of barbaric legal usage, which was not abolished till about the middle of the last century. At a remote period, the chief of the Macgregors became violently in love with a beautiful young woman of the glen, who was betrothed to one of his clansmen. The addresses of Macgregor were in the highest degree distressing; but though she was the daughter of a serf, and he was her chief, neither his threats nor entreaties could induce her to alter her resolution not to listen to his proposals. At length, enraged by her obstinacy, Macgregor's love was turned to hatred; and to revenge the slight which he imagined he had received, he devised the horrible plan of causing her to be accused of having conspired against his life by means of witchcraft. In the mock trial which ensued, it is almost needless to say that this unfortunate female was condemned, and was forthwith hanged upon the Gallows Hill, and her body afterwards suspended from the gallows in a creel or rustic basket. The corpse of this victim of superstition continued for a considerable period bleaching in the rain and sun, till during a violent storm, when it was blown from the gallows, and thereafter conveyed away and privately interred by the sorrowing and impotent relatives. It is a remarkable fact, though of course proving nothing in the way of retribution, that the descendant of the Macgregor who inflicted the above atrocious act of despotism, was, according to tradition, the first Highlander who suffered the punishment of hanging in chains—a doom held by the Scots at the time as the most abhorrent to the feelings.

INTERCOURSE WITHOUT LANGUAGE—A RECOLLECTION, BY AN OLD OFFICER.

It is surprising how people of different nations and tongues, and not understanding each other's languages, contrive to make their wants known to each other; to enter into bargains or contracts for their supply; or to fix the price or remuneration for them respectively. This was strongly exemplified in my own case many years ago, when, at an early period of my life, I was, from particular circumstances, carried in the ship in which I was embarked to the coast of Arabia, where we anchored and remained for some time. I was a lieutenant in a regiment proceeding to Bombay; and as our ships were in want of refreshments, we were obliged to have sailors constantly on shore, and to land a subaltern's party for their protection, and to preserve due order between them and the natives. The subaltern's party were to be relieved weekly; but as my brother officers preferred remaining on board their respective ships, and I infinitely preferred remaining on shore, with the consent of our commanding officer I took the duty for the whole six weeks that we remained there. I spoke not a word of Arabic, nor of any other language that the natives understood; and they were equally ignorant of English; notwithstanding which, I became remarkably intimate with some of them; and by signs, and tokens, and other means, contrived to make a bargain with particular persons for antelopes, which they were to shoot and bring me, and for which I was to pay them, and besides to supply them daily with a small quantity of powder and ball. Every morning, therefore, these people came to my tent to get the settled quantity of ammunition; then went off into the interior, and generally returned next day with what they had killed, and, according to our contract, made me the first offer at a dollar for each antelope. We had no small coin to exchange for articles of small value; we therefore cut our dollars into triangular bits, which they readily took, for it was for the metal to convert into ornaments for their women that they desired our money. Our regiment was a Highland corps; and the Arabs were highly delighted with the music of our bagpipes, and to see our men dance reels to them; and in return they danced to us their war-dance, accompanied with shouting, brandishing their swords, and striking them against each other's shields, for in this manner they were armed.

No. 102. SATURDAY, JANUARY 11, 1834. PRICE THREE HALFPENCE.

HARRY WEIR.

SOME years ago there lived in Edinburgh a man named Harry Weir, a dyer to his trade, and an honest hard-working man as ever breathed, but who, being tormented for many years with a worthless wife, at last lost heart in his business, began to drink a little, and accordingly declined rapidly in his circumstances. Harry was originally a man of some mettle, and had invented some particular shade of blue, which was called the Weir blue, being the next in shade to Mazarine blue; so that he might, with something like a colour of truth, be said to rank very near in greatness to one of the most famous ministers whom France or the world ever saw. Harry was a good deal puffed up, we believe, about the Weir blue; but the grand cause of his declension was the wretched woman to whom it was his misfortune to be united. This base creature had originally been a woman of sober habits, though without any strength of mind to bear her up against temptations; and having, from a love of gossipping with idle and dissipated housewives in the neighbourhood, contracted a habit of *tasting* spirituous liquors, and finally of drinking outright, she soon proved completely unworthy of her husband's confidence; would appropriate the money received in his absence to gratify her depraved appetite; and even, at last, when all other means failed her, pledge away the furniture of her house, in order to purchase the means of indulgence. Harry tried for a time, on account of his children, to keep up a stout heart against this evil; but all would not do. If a man finds his home rendered a waste, and his substance perverted to the worst ends, by one who is properly designed to comfort and assist him through life, it is hardly to be wondered at, that he flies from the one, and neglects the improvement of the other, and that finally he becomes almost as bad, through pure despair, as his unworthy partner. Such was Harry's case. His neat shop in one of the second-rate streets in time grew dim and paltry. He was seldom to be found in it himself. If a customer called, he would perhaps find a woman in a state of speechless intoxication behind the counter. The unfortunate dyer would himself be seen occasionally, towards evening, in a condition hardly any better. The proper consequences followed. Harry Weir became a bankrupt.

When such a calamity as this happens through unavoidable circumstances, the unfortunate individual often receives such consolation from his wife—is so edified and spirited up by the nervous resolutions which she forms on the occasion, and which only a woman *can* form—that he is enabled to retrieve the accident, and in time place himself on almost as good a footing with the world as ever. But alas for the men who stand in the circumstances of Harry Weir! To them no star of hope sends forth its reassuring ray: the very motive to renewed exertions is taken away, in the consideration that, if we failed before with every advantage in our favour, how can we be successful now, when all circumstances are against us. Harry, however, did make an effort. The wants of an infant family form in themselves a motive—one that would operate in the very jaws of despair. He struck his colours in the somewhat flaunting shop which he had had in the New Town, and in the course of a week or two raised a small pennon of the Weir blue over a humble tabernacle in the Candlemaker Row. Though not inclined to suicide, he said, in a witty shop-bill which he published, that he was resolved to dye at all hazards. "Do or die," was some people's motto; but, for his part, he was determined to do *and* dye. All was here made face that would be face. The window was filled with persuasive placards and specimens of silk of various hues; and though Mrs Weir was little better than ever, Harry himself showed a manful and sober front to the world, absolutely denying himself all kinds of liquor for a whole week. A little business did come in; but the poor dyer had neither patience nor capital to hold out till a complete resuscitation should take place. His wife soon became worse than before. He again lost heart. The shop once more grew dusky and shabby. The resolutions expressed in his whimsical shop-bill began to be strangely at variance with the appearance of the window in which it was exhibited; till a considerate spider, with a tenderness which the human race would do well to imitate, saw the ridicule to which it was exposed, and drew a veil over that which he could not remove. Harry dragged on to the next term, when a strange revolution took place in his circumstances. Being unable to pay his rent, his landlord had arrested his furniture, and he was next day to be turned adrift, without a stick or a rag wherewith to recommence the world. He had that day drawn eighteen-pence for dyeing a lady's scarf. Of this he gave a shilling to his eldest daughter to buy provisions for her brothers and sisters; with the remainder he went forth to purchase an hour of oblivion—for he was now arrived at that stage of misery when, if a little momentary relief can be at all gained, the future excites no care. At his return, he was informed that a fire had taken place in his humble dwelling, from which his children had been saved with great difficulty—but *they only*. Every thing else—the furniture, the counter and shelves, the pennon of Weir blue, the shop-bill and the humane cobweb—had been burnt. One life had been lost: it was needless to inquire how or why; but the grand source of Harry's miseries was shut for ever.

The fire, with its lamentable circumstances, occasioned some sensation in the city, and a benevolent gentleman, conceiving it to be a fit occasion for his interposition, commenced a subscription in behalf of the unfortunate sufferers, by which a few pounds were raised. This sum was in reality so much gain to Harry, for, as his furniture had ceased to be his own, he could not be said to have lost any thing by the fire. Coming upon him at a moment when he seemed utterly destitute of resources, and accompanied as it was by the sensation of relief, which was certainly the most prominent, though not the only feeling produced by the death of his unhappy spouse, it re-erected the man into something like his former self, and promised, for a time, to be the means of redeeming his fortunes. He took a shop in one of the streets leading out of town, where he had some vacant ground for his business, and where, if population was scant, rents and public burdens were moderate. Here Harry established his little family under the charge of his daughter already alluded to, a girl of about fourteen, and prudent beyond her years. Of furniture he had very little; but it was enough in the meantime. He was more anxious to lay out his little capital upon the materials of his trade, more particularly as he had resolved not to confine himself to dyeing, but to attempt the business of a scourer also, which he knew to be more profitable. In no long time he had furbished up the apparition of a shop—an airy, gauzy, spectral-looking place, with a few empty shelves within, a flashy shambling sign on the front, and a tall pole and cross beam over all. His shop-bill now went beyond all precedent in puffing. It represented him as a dyer in general, and restorer of gentlemen's apparel. "Some people pretend," said he, "to renovate gentlemen's apparel; but they only wash it. I really do renovate it. A coat may have sunk into what appears the eternal sleep [it should have been *nap*] of death; but once let me get it subjected to my patent electric process, and it is restored instantly to its pristine state. It awakes to a new life. And home it comes to the owner, as fair and glossy as ever. Hats, in the same manner, I can, for one-and-sixpence each, bring back to all their wonted woolliness and lustre: in fact, the buying of new hats, after this, is in a great measure precluded—for I can make the old ones quite as good for a trifle. Waistcoats—the patent fluid creates a new soul under the ribs of waistcoats." And so forth. It would have been all very well if the world would only have believed it. But, unfortunately, Weir's pretensions only excited suspicion. Gentlemen and ladies saw, within a shop of the most ghastly and insubstantial appearance, a man of whose nose the point alone would have dyed the multitudinous sea incarnadine. Which of the two *bills* to believe, that was the question. The evidence for the latter was certainly not the weakest. They therefore feared, that, instead of *restoring* their clothes, he would keep them to himself. That he would *scour*, was the only part of his professions to which they could attach the least likelihood. Besides, poor Weir presented in his own person that argument against his pretensions, which has so often been brought to bear upon fortune-tellers. If he was so expert in reviving clothes, why appear so deplorably out at the elbows himself? Why not, on the principle of charity beginning at home, try the first experiment of his electric liquid upon that jacket, for instance, which appeared to have seen so much service upon his own back? It was evident from this ratiocination, that no man who pretends to renovate gentlemen's apparel should wear a single shabby stitch himself. He ought to be constantly gleaming under the splendours of a new suit.

These circumstances operated so strongly against Weir, that he obtained very little business—not nearly enough to render him any profit. A few printed gowns and greased coats came in from the neighbours; but he totally failed to attract any employment from the neighbouring city. This small quantity of business was worse perhaps than none at all, for it was executed at a greater expense than it would bear, and left him in the meantime a loser. Every practicable effort was made, every expedient tried, in order to obtain more custom. He was himself as sober and steady as he had ever been in his life, and was inspired with a sincere and earnest desire of doing what he could for the support of his family. But that which a little capital might have enabled him to do, was denied to his present pennilessness and want of credit. He could not keep himself and those depending upon him in life, till the period of remunerating labour should arrive. For whole afternoons would he be seen at his door, brushing long slips of damp silk and cloth, and apparently in a great bustle, though he in reality was doing nothing—all being intended merely to impress passengers with the idea that he was a thriving and active person, who would do their work, if they chose to give it to him, in double quick time. He had, moreover, taken the expedient of planting himself nearer to the city than several other persons in his line on the same street, so as to have the chance of intercepting some business that might have otherwise gone to those who were not so much in need of it. Sometimes a blundering maid-servant or apprentice boy, who had been dispatched with a bundle of clothes to be scoured by one of those individuals, whom the proprietor was in the habit of regularly employing, would stumble into Weir's ever open door, on the supposition that *this* was the place to which the bundle was destined; a mistake which Weir was not bound, as he

said, to correct. No such blunderer ever required to ask any questions as to whether this was the right place. "Come away, my bonnie lassie," Harry would say; "what is it you have brought me to-day? How are they all up the way? Lay the bundle down here, and I'll open it. Do you want the towel back again with you?" And so on he went, in a torrent of plausible talk, to occupy the mind of the bearer of the bundle, and induce the supposition that all was right; which he generally succeeded in doing. Yet all these ingenious artifices did not suffice to establish that full and constant flow of custom which was necessary to enable the poor dyer to keep his head above water.

One long dull sunny afternoon in the month of September, when nothing seemed to be abroad but the sun, and the pennon of Weir blue flaunted lazily in the air—when nothing was heard but the buzz of a wasp from the neighbouring grocer's, which occasionally took a jig against the window-pane, and all mankind seemed to have deserted the surface of the earth—Harry sat in deep cogitation within his humble shop, not a penny in his pocket, not an ounce of food in the house for the children's evening meal, and no more likelihood of a customer coming in, even by mistake, than there was of the sky showering copper money at his door. He had sat thus for an hour in silent abstraction, revolving all kinds of plans for obtaining a livelihood, when his eye happened to catch the title of a paragraph in a fragment of an old newspaper which lay upon his counter. The paragraph was headed "Old Clothes," and gave an account of the vast system which was carried on in London by the Jews for the exportation of that article of merchandise to Germany. Thousands upon thousands of coats, vests, and other things not to be mentioned, regularly shipped off every year for Hamburg! Hundreds of persons, both in this country and in that, making a livelihood by collecting and distributing the article! A handsome surtout, perhaps, after adorning the person of a London exquisite, seen afterwards walking the streets of Weimar upon a German student, and ultimately concluding its existence as a scarecrow on the plains of Hungary! Harry paused a moment to think, and then starting with galvanic energy from his stool, exclaimed, "I have it—it will do!" The exultation of Bentham, on forming the mighty idea of the greatest happiness principle, did not exceed in enthusiasm of joyfulness the exclamation of Harry Weir. Reader, that was the moment of the conception of one of the most important mercantile systems which now attract your observation on the highways of this world. Harry had formed the resolution to become a dealer in old clothes upon a plan and scale hitherto not dreamt of in his native country. "Why," thought he to himself, "the Edinburgh gentry have old clothes to sell also. There are, moreover, many people amongst us who are disposed to buy such goods; but, for want of a system of collecting, like that carried on in London by the Jews, most of the cast clothes of gentlemen with us are left to waste their sweetness on the desert air, if not to perish by moths, for want of the said contact with the atmosphere. What is wanted, is a medium of communication, by which the article may get from the hands of those who wish to sell, to those who wish to buy. That it shall now be my duty to supply. Impudence, be thou my friend to a small extent, and Harry Weir is once more a man."

Equipping himself next day in his best remaining attire, as much *renovated* as possible, he proceeded to one of the best streets in the neighbouring city, where, on any gentleman passing him (for he walked slowly), he, without turning his head, or appearing to accost the said individual, breathed into his ear the insinuating words, "Any old clothes, sir?" Gently as this sentence was pronounced, it operated upon the most of minds like a spell. It awakened all at once the idea that here was a new branch discovered in the widely ramified system of social conveniency—here was a plan for putting to use many articles which had hitherto been condemned to waste. It was not long, therefore, before Weir had made appointments with several individuals to call at their residences at a certain hour, and make purchase of their cast wardrobes. How to provide himself with funds was now the most pressing consideration. No other expedient was open to him but that of pawning a particular article of furniture, of some little value, which he had not yet parted with. Armed with somewhere about twenty shillings, obtained in this manner, he proceeded to one of the gentlemen's houses as appointed. Here, however, the quantity of clothes was so much beyond his present capital in value, that he was obliged to make some excuse for putting off the close of the bargain. He proceeded to two or three others, where he had to do the same thing, but, at length, finding one where his money was sufficient, he made what he thought an advantageous purchase, and, immediately proceeding to one of the marts for the sale of cast apparel, realised 50 per cent. by transferring it to one of the most respectable dealers. He had now thirty shillings, which of course enabled him to close his bargain with one of the gentlemen who had things to that amount. This second purchase he disposed of to another dealer upon equally advantageous terms, and thus was able to make a third and still larger purchase. So he went on, till he had bought all the lots which he had been invited to see: after which, he betook himself once more to the street for new appointments. For a time, his trade prospered amazingly. Almost every body had a pack of old clothes to dispose of; and such as did not awake to the system at his first whisper, had thought of it before the next, and were prepared to enter into his views. Harry was aware of the risk he ran of getting rivals, and he, therefore, sold his goods to as great a variety of dealers as possible. His *trick* was nevertheless discovered at last, and immediately imitated by whole legions of poor devils like himself; whereby gentlemen were so much pestered as they walked the streets, that they soon grew quite sulky, and inaccessible even to the most plausible and insinuating address; some proceeding so far as to knock down the whisperer, or hand him over to the police as a nuisance. Harry, however, had by this time acquired what was to him a little fortune, and being snugly established in a shop in St Mary's Wynd, with a considerable stock of goods, felt himself at liberty to despise the arts by which he had risen. He still retained the exclusive patronage of many of the gentlemen with whom he had first transacted business, and thus was able to keep up a constant supply of the article in which he dealt; while his neighbours or their emissaries had to endure all kinds of contumely on the streets, without getting nearly so good a share of the *exuviæ* of mankind. Now also did his ingenuity as a renovator of apparel come into full play. He did not absolutely perform the miracles specified in his former bill, but he executed his work at once in a cheaper and in a better manner than his fellow-brokers, and thus of course was able to realise better profits. He gave the black coats, and other garments which he purchased from gentlemen, such a gloss of freshness—such an appearance of newness, that his shop, and his little trying-on room up stairs, of a Saturday night, were more crowded than any other establishment in the alley, by persons seeking for bargains of cheap and good-looking Sunday habiliments. In short, HarryWeir had now got hold of a profitable trade; and, from being one of the poorest wretches on earth, was suddenly raised by one ingenious thought, promptly and cleverly acted upon, to a state of comparative comfort.

The utility of this story of humble life is of a compound nature. It is here shown, that an ill-disposed wife will bring the most ingenious and active tradesman to ruin; that relief from that pest will not always be sufficient to restore prosperity where it has long been wanting; but that, if the aggrieved party shall keep his energies from that besotting vice, to which, under such circumstances, he is liable, they may yet command some turn of fortune, which shall once more, to use a familiar phrase, set him upon his feet.

POPULAR INFORMATION ON ROMAN HISTORY.

ROMAN GAMES AND ENTERTAINMENTS.

A SKETCH of the history of the Roman republic and empire, as well as of the religious practices of the people, having been already given in the Journal, we proceed to describe some of the other characteristics of this remarkable nation.

The greatness and power of the Roman people were founded principally on their military capacity, by which they contrived to lay the whole known world under contribution, for every species of supply to their necessities and gratifications. These supplies being dispensed, either by the state or by great men, to their large bodies of retainers, it happened that the people generally had much time to spare from their ordinary duties to devote to the pursuit of idle amusement. From this cause, and perhaps from the desire of those in authority to keep the community from thinking deeply of their condition, there were instituted a variety of games, spectacles, and dramatic entertainments, to which all had free access, and which afforded constant pleasure to the spectators; as the games were likewise in some instances dedicated to religious ceremonial, it was of course a mark of piety to attend them. At Rome, the great place of public resort for objects of this nature, was the Circus, an open amphitheatre of an oval form, extending to the length of upwards of two thousand feet, and which measured in circumference fully an English mile. This vast open area was surrounded with rows of seats, rising one above another, the lower being of stone, and the higher of wood; and separate places were allotted for the different orders of the people. No fewer, it is said, than 250,000 persons could be accommodated in this manner; and there being different entrances and outlets, no disturbance or confusion took place. The Circus was thus open to the weather; but one of the emperors erected covered awnings or roofs of fine cloth, which could be drawn in case of rain falling, or the sun shining intensely; and in case of the wind blowing so as to prevent the coverings being spread, the spectators used broad-brimmed hats, and sometimes a kind of umbrellas. To show how far the gratification of the people was consulted, there were in the amphitheatres secret tubes, from which the audience were besprinkled with perfumes—an excess of luxury which appears extraordinary in the present day. The area of the Circus was not altogether clear. In the middle, for almost the whole length of it, there was a brick wall, about twelve feet broad, and four feet high, called *spina*, round which the horses and chariots turned in their races. Pillars were also erected, answering the purposes of modern starting and winning posts.

The chief of these public amusements was the racing of chariots and horses. The chariots were low two-wheeled vehicles, drawn by two horses abreast, the charioteer standing within a high front, holding the reins. A great deal of attention was paid to the matching of these charioteers. They were distributed into four parties or factions, distinguished by different coloured dresses or liveries; and the partisanship of these factions often raised sanguinary disputes among the onlookers. In the time of Justinian, no fewer than 30,000 men are said to have lost their lives at Constantinople, in a tumult raised by contention among the partisans of the several liveries. In the present day, disputes of this origin are happily allayed among the attendants of horse races, by the practice of betting. It must have been a fearful sight to witness the starting of a large body of chariots in the Circus. A signal being given by dropping a napkin or cloth, a chain was withdrawn, when they sprung forward, and whoever first ran seven times round the course was victor. This was called one match, for the matter was almost always determined at one heat; and usually there were twenty-five of these in one day. The name of the victor being proclaimed by the voice of a herald, he was crowned with palms, and received a prize in money of considerable value. The use of the palm-tree to form crowns of victory was borrowed from a practice of the Greeks; this tree being chosen for the purpose because it rises against a weight placed on it; hence in modern times it is put for any token or prize of victory in honourable contention.

The next description of these public exhibitions consisted of contests of agility and strength, of which there were five kinds: running, leaping, boxing, wrestling, and throwing the discus or quoit. The place where the wrestlers and others met to be trained in these exercises was called a *Gymnasium*, from whence is derived our word gymnastics. But none of these exhibitions were so brutalising in their nature, as one which consisted in the fighting of wild beasts with one another, or the fighting of beasts and men; who were either forced to this by way of punishment, as the primitive Christians were, or fought voluntarily, either from a natural ferocity of disposition, or induced by hire. An incredible number of animals of various kinds were brought from all quarters, and kept for the entertainment of the people, at an immense expense. Pompey, in his second consulship, exhibited at once five hundred lions, who were despatched in five days; also eighteen elephants. The emperor Augustus introduced the exhibition of a sea-fight, by digging a lake near the river Tiber. Those who fought on these occasions were usually captives or condemned malefactors, who contended against each other till one party was slain, unless saved by the clemency of the presiding emperor.

It was a custom among the Romans to slaughter captives at the tombs of those slain in battle, to appease, as they imagined, the spirits of the deceased. From this savage practice was introduced the custom of causing captives to fight against and kill each other publicly, for the gratification of the assembled multitude. The unhappy beings who thus fought in the Circus were called gladiators; from *gladius*, the Latin word for a sword. The combats of gladiators took place chiefly on great occasions of rejoicing, when incredible numbers of men were destroyed in this manner. After the triumph of the emperor Trajan over the Dacian nation, spectacles were exhibited for 123 days, in which 11,000 animals of different kinds were killed, and 10,000 gladiators fought; whence we may judge of other instances. To prepare the gladiators for such severe contests, they were regularly trained and exercised with wooden swords. Latterly, freemen became gladiators for hire, and even men of noble birth, and, what is still more wonderful, women of quality, fought in the arena. Gladiators were distinguished by their armour and manner of fighting. Some wore a helmet, a shield, and a sword; and such used to be matched with others wearing nothing on their head, but bearing in their left hand a three-pointed lance, and in their right a net, with which they attempted to entangle their adversary, by casting it over his head, and suddenly drawing it together, and then slaying him with their trident. In fighting together, these gladiators were sometimes elevated on a temporary scaffold raised by secret springs out of the arena. The bloody encounters of these combatants were viewed with breathless anxiety by the crowds of spectators; when they became much interested in the fate of any one who seemed to deserve to live, as a token they pressed down their thumbs; but when if to be slain, they turned up their thumbs, and ordered him to receive the thrust of the sword, which gladiators usually submitted to with amazing fortitude. Such was the appetite for this cruel exhibition, that the citizens of ancient Rome spent whole days in the Circus, feasting their eyes with the struggles and tortures of their fellow-crea-

tures. It is allowed by all writers that these representations tended greatly to brutalise the populace, and to render them cruel or blood-thirsty. As quite adverse to sound morals, they were prohibited by Constantine, the first Christian emperor; but were not entirely suppressed for some time afterwards, till the reign of Honorius.

The games of the Circus were succeeded by dramatic entertainments or stage plays, these being first introduced at Rome, on account of a pestilence, to appease the Divine wrath, in the year 391: This idea of attending a theatrical entertainment to please the Creator of the World, will indicate to our readers the debased condition of the understanding of the Romans. The theatrical entertainments of the Roman people were of divers kinds, as dancing to music, pantomimes, comedies, and tragedies, though it was a considerable period before they came to perfection in these branches of the scenic art. The practice of wearing masks they copied from the Greek players. The Romans also had rope-dancers, who used to be introduced in the time of the play; also interludes or musical entertainments. The plays were often interrupted likewise by the people calling out for various shows to be exhibited, as the representations of battles, triumphal processions, gladiators, and wild beasts. The noise which the people made on these occasions is compared by Horace to the raging of the sea; the actors were also loudly applauded or hissed, as they pleased or displeased the spectators, as in our modern theatres. The actors who were most approved received crowns, which, as at other games, were generally composed of leaves or flowers. The theatres at Rome could accommodate from 40,000 to 80,000 persons, and were of the most magnificent construction, and were latterly covered with roofs, like those in our own times. The internal arrangements of these theatres somewhat resembled those now acted upon; our terms *orchestra*, *proscenium*, &c., being immediately derived from the Roman phraseology. The benches, or seats of the spectators, also rose above one another, and were distributed to the different orders of society in the same manner as at the amphitheatre. The foremost rows next the stage were assigned to the senators and ambassadors of foreign states; fourteen rows behind them to the knights or gentry, and the rest to the common ranks of the people. Certain officers usually attended at all public shows, to regulate the places of sitting, or points of etiquette, as in the case of our masters of ceremonies. We therefore learn that the arrangement of seats into three distinct divisions, analogous to our boxes, pit, and gallery, is as old as the institution of theatrical entertainment among the Romans. It appears that the Roman senate were occasionally far from countenancing public performances on the stage, which they found, even in the comparative infancy of the drama at this early period, were opposed to good morals; and, to obviate the opposition of the supreme magistracy, the theatres were sometimes dedicated as temples to the gods.

EMIGRATION.

This week we postpone our papers on the Western States of America, in order to lay before our readers the following extracts from the letters of a young lady, the daughter of a respectable individual who lately emigrated from the town of Dalkeith, near Edinburgh, to the state of New York, where he is now comfortably settled on a cleared estate. The information, it will be observed, is suitable only for capitalists, as, for instance, farmers in this country, who, for little more than the annual rent of a farm here, may purchase the freehold of one almost equally good in the settled portion of the Union. We pledge ourselves for the accuracy of the letters, a perusal of which we were favoured with:—

"Albany, 24th July 1833.

"My Dear Catherine—I expected to have had time to write to you before leaving New York, but found it impossible, from being so hurried; so I will now try and tell you something of our voyage from Scotland, and proceedings since. We sailed from Greenock on the 29th of May, in a vessel for New York, where we landed on the 17th of July.—[Here the fair writer gives some particulars of the voyage, by no means interesting to our readers.]—When we came near New York, an American doctor came on board to examine into the health of the passengers; and we had to ride quarantine only one day; but all the dirty clothes in the ship had to be washed before we were allowed to go on shore. The custom-house officers examined our luggage on the quarantine ground at Staten Island, about seven miles from New York: they were uncommonly civil, and drank ale and talked nonsense as well as any young men could have done in the country I had left. We might have smuggled any things we had thought of; and I almost wished I had brought some silk and merino dresses with me; for silk is as dear, and not near so good, and merino far dearer than at home. I have found that butcher-meat and vegetables are almost as dear as at home; but bread is cheap; butter and milk good; and fruit almost for nothing. Whom do you think I happened to meet in New York, but J——— ———, that you have heard me speak of? There is a great improvement on him, and he has made a good deal of money at his business of a baker. I went across the river with him to Hoboken, in a steam-boat, about fifteen minutes' sail. It is a very beautiful place, but not well kept, every thing growing wild, without being trained. It was on a Sunday I went, and I am sure there were five thousand or six thousand people there. You would be astonished if you saw the American gentlemen; they are the handsomest fellows in the world, and beat the Scots gentlemen hollow; they are not only handsome, but smart and well dressed. In passing along Prince's Street, in Edinburgh, you will meet many affected foppish puppies, who do not appear to have a grain of sense in their composition; but here the young gentlemen have a smart intelligent look, and quite superior to the silly dandies in the old country. As for the American ladies, they look very well, but are not half so well dressed as our ladies, and you will not see one lady for twenty gentlemen. They have far finer stores here than we have: no shops that I ever saw were so splendid; but the storekeepers are the sauciest set you can think of, and do not seem to care whether they serve you or not. The American servants are as ill every bit. The hotel we staid at has a good many servants, but no one would brush our shoes; if you want them cleaned, you must go to a place where there is a sign of a brush, and a negro will do it.

My mother and the children went to Albany in one of the luggage-boats. My father and I got into one of the steamers: it was named the Ohio. The grandeur of it you can have no idea of: it was one of the night-boats, and every one had a bed to themselves. There were more than five hundred beds for gentlemen, all hung with scarlet damask moreen. The ladies' cabin was splendid: the beds in it were of orange damask, beautiful Brussels carpets, fine dressing-glasses, and the rest of the furniture far richer than any thing I ever saw at home. The scenery on the banks of the Hudson river, and the country around, were all and more than Stuart described them: it is indeed the glorious Hudson. We are to leave Albany to-day, and go on to Buffalo, about three hundred miles farther up: it will take us four or five days: we have to go by the [Erie] canal. I can assure you I am heartily tired of travelling, although I think now nothing of two or three hundred miles."

"Brighton, Monroe County, State of New York,
26th September 1833.

"My Dear Miss S.—You will already have heard of our arrival in America; but I deferred writing to you till we were somewhat settled here. We staid only four days in New York, and went from thence to Albany in a steam-boat, which might well be called a floating palace: it was very commodious, and the fare for each passenger was three dollars. In proceeding from Albany to Buffalo by the Erie canal, we stopped at Schenectady, a large town on the canal. Here we learned that our old minister, Mr F——, lived at Princetown, a place only ten miles distant. We got a gig, and went to see him. He was not in the house when we called, and was working at his farm. When we saw him, he was much stouter than formerly, and you never would have known him to be a minister from his appearance. He was well contented and happy, also his wife and family. He advised my father not to go to the state of Ohio, as cholera was very bad there this summer; but to stop beside him, look round the country, and settle in his neighbourhood. My father, however, did not like the land there; and so we got into the canal-boat to go on to Buffalo, and then proceed to Ohio, as we intended before we left Scotland. But the boat got leaky, and could not proceed farther than Rochester, where we also stopped, being heartily tired of travelling by canal-boats. You may have some idea how uncomfortable we were, so many of us, all our luggage, and a number of passengers besides, in one of those wretched boats not so large as any of those that ply on the canal between Edinburgh and Glasgow. We rented a house in Rochester, which is a large, handsome, and increasing place. The Genessee river runs through the town, on which are situated many flour-mills and other establishments. The Erie canal crosses the river in the centre of the town, in a splendid aqueduct of red freestone. Rochester being situated on the canal, and only a few miles from Lake Ontario, and a ship navigation within two miles, its inhabitants are enabled to select a market either at New York, Quebec, or the borders of the great western lakes. Its other natural advantages for trade and manufactures make it as busy and stirring a place as any other of its size in North America. My father, on inspection, liked the country around, and was determined to go no farther west if he could find a farm to suit him; and I daresay he travelled forty miles round in every direction before he made his choice. I was often with him in these excursions, and I do think the Americans here are the most polite and obliging people in the world. There is a settlement of Scotch twenty miles from Rochester, and called Caledonia. I went to it with my father, and we called first on a Mr M'———, a Highlandman. We told him we were lately from Scotland; coming from the 'Land o' Cakes' seemed to have a talismanic effect upon him. His horses, his gig, all were at our service in a moment. He introduced us to his neighbours, who were equally kind and obliging, and I was soon as much at home in New Caledonia as ever I was in the old one. I have since been there on a visit, and it was a continual round of visiting among the neighbours, who were equally kind. There I heard a Gaelic sermon preached for the first time in my life. But I am forgetting to tell you about our own place. My father bought a farm about a week since, of one hundred and sixty acres, about three miles from Rochester. It is as pleasant a place as I have seen in America, and I am sure there is no place half so pretty in Scotland. Our house is beautifully situated; and from the windows of the second flat we have a view of the whole farm. The house contains a dining-room, drawing-room, and parlour, six bedrooms, with garrets, kitchen, and cellar, &c., finished in the best style; every window has green Venetian shuts, even to the milk-house one; pretty flower-plots round the house, quinces and roses growing up to the windows; a large garden in front, with an esplanade of vines running across the whole breadth of it. We have a handsome front door, with a flight of steps, and seats on each side of it. Eskbank [a place near Dalkeith] is not nearly so pretty. At the back of the house is the peach orchard, and it is a noble one; there grew in it the last year 250 bushels of peaches. About a hundred yards from the house, are the plum and apple orchard, of seven or eight acres in extent, where you literally wade among the fruit. You can have no idea of the vast quantity of plums and apples here; if we could be at the trouble to pull them, we would find a market for them at Rochester, to go to Canada. There are excellent barns, stables, and other outhouses, all in good repair. There are about 106 acres of cleared land on the farm, the land being ploughed and ready when we bought it; and I now, from the window at which I am sitting, see my father sowing his wheat, and my brother George carrying the seed to him. He will have in between thirty and forty acres this fall. The rest of the farm is in fine wood, beautiful oak and hickery, black-walnut, and butternut trees, some of them fifty feet without a branch. The wood land is as valuable and more so than cleared land, being so near Rochester, where so much wood is consumed for want of coal in this part of the country. A fine stream of water runs through the farm, which drives a saw-mill—a very profitable concern, a share of which belonged to another man, whom my father has bought out. He has now the farm and all about it, free and unencumbered. He paid thirty-four dollars (about L.7, 14s. sterling) an acre for it. It is reckoned an excellent bargain by all the neighbours round, as he had it one thousand dollars cheaper by paying down cash than he could have bought it for on credit, or one-half cash and mortgaging, which is a good deal practised here. Ready dollars tempt the Americans more than any thing, for ready money seems the greatest want among them. Every one appears anxious for property: a man buys a farm for 4000 dollars, but he will pay only perhaps 1000, and pay an interest of eight or ten per cent. on the remainder. Dollars, dollars! is the incessant cry here. You will no doubt think thirty-four dollars a high price for an acre of land in America, and certainly it would be a dreadful price for land in Canada or the western states; but here, in the state of New York, it is very different. Here the country is mostly well cultivated, and more populous than many parts of Great Britain, and the markets are good for every thing that can be raised, even to a cabbage. Vegetables, I think, are dearer than any thing, because few people raise more than to serve themselves: we generally paid five and six cents (about 3d.) for a single cabbage in Rochester market; but victuals are generally a great deal cheaper than in Scotland. We reckon that a dollar will go as far here in buying things we need (clothing excepted), as a pound did at Dalkeith. The people hereabouts seem to grudge sugar more than any thing, and many take their tea and coffee without it. We have quite a new system of living here. We get up at five in the morning, breakfast at six, dine at twelve noon, and sup at sundown, and then off to bed. We have, as yet, had most beautiful clear summer weather, but oppressively hot, and frequent showers, which keep every thing fresh and green. The showers do not last long, but are very heavy: there has just been one, with a good deal of thunder. The climate appears no way injurious: we have never heard a cough amongst us, nor a complaint, since we came here. You have no idea of the style of living here. Every petty farmer has his light waggon, or gig, with seats covered with buffalo skins, which looks very nice, and a pair of beautiful horses. The truth is, the people never think of walking: they get out a team, as they call it, and away they go, though perhaps they have not half a mile to ride. You will rarely meet any one walking on a road; and the farmers all about seem to live as well as the nobility of Scotland. Such loads of victuals they have!—a breakfast like a dinner you would have for a party, and a supper the same. They mostly have tea at all their diets, most of them being temperate. In this part of the country they do not cook any dinners on Sundays, as it interferes with their going to church. They take pride in raising every thing they need on their own farms. They make soap, candles, and cider; kill their own meat; take the wool, spin it, weave it, and dye it: in short, they do every thing. The American women here are very industrious; every one works; and no servants, but at extravagant wages. All the ladies go without caps, married ladies too, no matter how old they are: most of them have beautiful hair which they dress

tolerably well: no curls, all done up with combs; the combs they have for their back hair are low ugly things; mine was a perfect wonder; but I have broke it, and I will never get another any thing like it. We had to purchase a good deal of stoneware at Rochester, most of ours being broke, and all our crystal. We got crystal of English manufacture much cheaper than at home. * * * * In looking back to the time since we left Scotland, it appears a mere nothing. It is scarcely four months since we left Dalkeith; and here we are, all well and comfortably settled, and all well pleased with our new home.—I remain, my dear Miss S——, yours truly, ISABELLA ——."

THE CAPITAL OF THE HIGHLANDS.

THE improvements effected within the Highland boundary in the space of the last sixty or eighty years, are in few places more conspicuous than at Inverness, a town situated near the east coast, at the distance of 156 miles north of Edinburgh, and about 550 from the British metropolis. Inverness is considered the capital of the Highlands; and being the only town of any consequence in a wide district of country, it has in recent times risen into importance, opulence, and refinement. This pleasing town, which contains from ten to twelve thousand inhabitants, occupies an exceedingly advantageous and delightful situation in the low eastern part of the country, chiefly upon the right or south bank of the river Ness, near the place where that river falls into an arm of the German Ocean, called the Moray Frith.

Inverness is a town of remote antiquity; its origin being lost amidst the fables of bards and local historians. Not to go back farther than the eleventh century, it is related that Duncan, king of Scots, was murdered in the castle of Inverness, by Macbeth, in the year 1039. Shakspeare has followed the usual accounts of this transaction; and the poet has done justice to the agreeable situation of the castle in which the foul assassination is said to have occurred:

> "This castle hath a pleasant seat; the air
> Nimbly and sweetly recommends itself
> Unto our gentle senses."

This edifice, which in reality was the property and residence of the Thane of Lochaber, stood on an eminence to the east of the town, a spot well worthy of the above flattering eulogy. Throughout the lapse of the seven subsequent centuries, Inverness figured in Scottish history on divers occasions, besides being made the scene of the quarrels and conflicts of Highland chiefs and their clans. During that time, an entirely different castle, bearing the same name, had been erected close to the town. This, after the revolution, was converted into a government fort, and, as such, was taken by the Highland army of Prince Charles, in February 1746. Only the wall of an exterior rampart now remains, while the place where it stood is so smooth as to be used as a bowling-green. The site has lately been gifted by the proprietor, the Duke of Gordon, to the town, for the erection of a new court-house, jail, and bridewell.

Inverness now consists of several well-constructed streets, and possesses a number of excellent public edifices, for educational, religious, and other purposes. The town is also well lighted with gas, and supplied with water by pipes. The schools of Inverness are reckoned among the best conducted in Scotland. The trade and shipping of the port have been extended by means of the Caledonian canal, the traffic on which terminates here on the east. Various steam-vessels now ply betwixt Glasgow and Inverness, by this channel, and in the summer months a steam-vessel arrives and departs weekly, in communication with Leith and Edinburgh. In a former article in the Journal, we mentioned that there are several annual fairs held here, the chief of which is a great sheep and wool market. At this fair nearly the whole fleeces and sheep of the north are generally sold or contracted for. The market is attended by the Dumfriesshire and other lowland sheep-dealers, and by woolstaplers from Yorkshire. The town possesses a variety of excellent shops, for the sale of all kinds of goods; it has also a good newsroom and circulating libraries; and at the book-shop of our respectable agent, Mr James Smith, the stranger will find a choice of the freshest and most popular literary productions from London and Edinburgh. The taste for reading has greatly advanced in this quarter, and although Gaelic is still the vernacular tongue of a large proportion of the humbler classes, a desire of acquiring knowledge, through the medium of the press, prevails to an extent which is far from being equalled in towns of similar extent even in the highly-favoured regions in the southern part of the island. In the present day, the town and the district around support two newspapers, to one of which, the Inverness Courier, we acknowledge ourselves to have been indebted. Travellers passing through the town can now command the best accommodation in the inns, and nothing is, indeed, wanting to render this one of the most agreeable and comfortable towns in the country. Besides, it should be told that the society of the town and its environs is esteemed among the most refined of any out of the metropolis.

The revolution of manners seems to have overtaken Inverness more recently than the towns farther south along the coast. Many a joke has been uttered by Englishmen, at the expense of the Scottish character, for cleanliness; and there is no doubt that the ridicule was deserved, as far as referred to the state of manners in the early part of last century. It is mentioned, that, about a century ago, the streets of Inverness were kept in the most uncleanly condition; and the story is told of a stranger gentleman asking the provost one day why the thoroughfares were not cleaned, when the worthy functionary replied, "there will soon be a shower"—implying that the rain was the best and cheapest scavenger. It was not till the Union, in 1707, that the first regular post to Edinburgh was established; and it was not till 1755 that letters were carried any other way than by a man on foot. The first coach ever seen in or about the town was one brought by the Earl of Seaforth in 1715, when the country people, as ignorant of the uses and arrangements of such a vehicle as the remote Chinese, looked upon the driver as the most important personage connected with it, and accordingly made him low obeisances in passing. We find that in the year 1740, the magistrates advertised for a saddler to settle in the burgh; and that it was so late as 1778 that the common-shaped cart was first used in the town, one of these vehicles being introduced by subscription. About the middle of the last century, the father of the late Bailie Young flourished in Inverness. He was a deacon of the weavers, and remarkable for his early adoption of new fashions. He was the first burgher who changed the blue bonnet of the olden times for a hat, which piece of dress had formerly been confined to lairds and clergymen. This novelty excited the ridicule of his fellow-citizens to an intolerable degree; they were perpetually teasing him with their congratulations upon such a splendid accession to the dignity of his personal appearance; his constant reply to their observations was, "Well, after all, I am but a mortal man." It is a common tradition at Inverness, that, about eighty years since, a shilling could have bought a leg of mutton, a neck of veal, and a gallon of good ale. Except in one house, there was not a room in the town without a bed—a usage, however, still quite common in Scottish provincial towns. Provost Phineas Macpherson, a late dignitary, whose fine old Highland manners might have ornamented a court, used to say, that in those days he lived with great hospitality and plenty, sporting claret at his table, and yet never spent more than seventy pounds sterling a-year. The vice of intemperate drinking is understood to have been carried to a great height in Inverness in these not very distant times. In the work usually called Burt's Letters, the writer gives a minute and animated account of the hospitality of the house of Culloden, in the days of the President's elder brother; telling, among other things, that the servants would on no account permit a guest to walk to his bed, considering that an insult to the laird; every man had to sit till he became insensible, and then they brought spokes and carried him off, as in a sedan. Modernised and improved as we find the manners and appearance of the people of Inverness, a southern stranger, on visiting the town, would still have the feeling of being transplanted into a population quite different, in aspect and language, from any thing to which he has hitherto been accustomed. The women of the lower ranks walk the streets, and even to church, the wives without bonnets, and the maidens without caps; while the extreme simplicity of the rest of their attire is quite consistent with this strange and primeval fashion. The men of the same condition, at least the peasantry, wear garments of the coarsest material, as homespun blue short coats, stockings of the species called in Scotland *rig-and-fur*, and small blue bonnets; some have plaids, but all of their garments display more or less of the Celtic fashion. Few of the neighbouring peasantry, when addressed, are found to speak any thing but Erse. In point of language, the people of Inverness, laying the lower orders out of the question, may almost be said to transcend those of all other Scottish towns, the capital not excepted. The common solution of this mystery, is, that they received a correct English pronunciation from the soldiers of Oliver Cromwell; but it seems rather attributable to the simple circumstance, that the people here do not learn English in their infancy through the medium of broad Scotch, but make a direct transition from Gaelic into pure English. In proportion as the colloquial English used in Scotland comes into use in the town, the tone of speaking will be found to be proportionably lowered in quality.

The want of some place of recreation in the open air was long felt in Inverness, but this cannot be said to be now the case. Two long narrow islands in the Ness, above the town, have been planted and beautified in a variety of ways, so as to make them a most delightful place of promenading in fine weather. The environs of Inverness, enriched by the fresh green foliage of these small islands, are perhaps not excelled in Scotland. The situation of the town, near the south shore of an arm of the sea, somewhat resembles that of Edinburgh; but here the views are of a finer description. Every thing is done for Inverness that can be effected by wood and by cultivation, the characters of which have here a richness, a variety, and a freedom, which the traveller will miss around Edinburgh. The mountain scenes are finer, more various, and more near. Each outlet is different from the other, and each is beautiful; whether we enter the valley of the Ness, or skirt the shores of the firth, while a short and commodious ferry wafts us to the lovely country opposite, rich with woods, and country seats, and cultivation.

THE RIGHTS OF PROPERTY.

To those who do not enjoy any portion of the surface of the earth as their own, the utility *to them*, of its being possessed by others, is not apt to be an obvious idea. Yet reflecting minds have long settled, that, even for a few to possess the property of the earth, is advantageous to all. We extract a very clear abstract of the philosophical views entertained on this subject, from Mr Wade's *History of the Middle and Working Classes*, a manual which we cannot too warmly recommend to the notice of those for whom it is designed. The general circulation of this work—the composition, we understand, of one who was himself at no remote period an operative—would, we are persuaded, be of the greatest service, not to any class in particular, but to the general interests of the country.

"In the cultivation of the earth, two modes may be adopted; either it may be cultivated in common or individually; the disadvantage of the former is, that it makes no distinction between the weak and strong, the idle and industrious; for superior exertion and ability there is no superior reward. Under this system, the world would not be reclaimed—men will not willingly labour for others; to stimulate exertion, rewards must in some degree be proportioned to deserts. Appropriation, therefore, or the right of every one to enjoy the produce of his industry, became necessary to the effective cultivation of the earth; each man, having a portion of land allotted to him, in which he vested his labour, became entitled to its produce. This was probably the foundation of property in the soil. By its introduction, no man's natural rights can be said to have been extinguished or encroached upon; the earth before lay common to all, but unprofitable to all—by appropriation it has been made valuable to all. Farther than this it does not appear necessary to inquire into the origin of the rights of property; their obvious utility must have forced themselves on every people on first emerging from the barbarous state.

A state of society, in which there is equality of possessions, in which each man tills his own land, and raises the food and clothing necessary to his wants, appears at first sight very fascinating. It favours that feeling of independence so dear to the human heart. But if we reflect on the tendency of such a mode of social or rather anti-social existence, we shall find it pregnant with misery.

In the first place, the mere labour of society would be greatly augmented. As each person's means would not exceed his current necessities, they would not exceed the amount essential to the maintenance of himself and family, the idea of capitalists is precluded, and, consequently, no expedient for saving labour by machinery or otherwise, could be employed. All would be engaged in spade husbandry or other manual occupation. Such a disadvantageous mode of exertion would obviously be very unproductive; it would yield none of the luxuries, and barely the comforts, of life; people would hardly be better off than the cottar peasantry of Ireland, or the pauper colonists of Holland; and the whole of society would be literally brought under the primitive curse inflicted on our first parents. If the physical wants were supplied with so much difficulty, the mental ones would be totally neglected. As each would be fully occupied in providing sustenance, there would be no spare time to any for intellectual pursuits. If science, philosophy, and the arts, had existed, they would speedily fall into disuse and oblivion. Ignorance and barbarism would overspread the land. Men would become unacquainted with themselves and with the natural phenomena by which they are surrounded. Their past history and future destiny would be alike shut from view; they would move, as it were, in darkness—the victims of suspicion, of mutual mistrust and superstitious fears—a prey to all those calamities which are known to be inseparable from savage life when divested of the illusions of the imagination.

From such a state of universal toil and dreariness

one naturally turns to the more cheerful appearance which actual society presents, and one of whose chief advantages is derived from the circumstance, that certain classes are exempt from at least the necessity of bodily labour. Now, this advantage could not be possessed without a certain degree of inequality in men's fortunes; in other words, the existence of a proprietary class. Property is not a free gift of nature; the value even of landed property is chiefly a product of labour; it is almost entirely capital, or the produce of anterior industry. But if this capital or property did not exist, there would be no fund in reserve to maintain a class of persons occupied in what have been very inaccurately termed unproductive employments: all would be engaged in procuring food or raiment, and none could exclusively devote themselves to the pursuits of literature, science, and legislation.

Besides augmenting the produce of the earth, and creating a surplus beyond the wants of the producers, the rights of property have other advantages; they *preserve it to maturity*. 'We may judge,' says Dr Paley, 'what would be the effects of a community of right to the productions of the earth, from the trifling specimens we see of it at present. A cherry-tree in a hedgerow, nuts in a wood, the grass of an unstinted pasture, are seldom of much advantage to any body, because people do not wait for the proper season of reaping them. Corn, if any were sown, would never ripen; lambs and calves would never grow up to sheep and cows, because the first person that met them would reflect, that he had better take them as they are, than leave them to another.'

Property also prevents *contests*. War and waste, tumult and confusion, must be unavoidable and eternal where there is not enough for all, and where there are no rules to adjust the division.

Further, it improves the *conveniency of living* by facilitating the division of employments. Without property this would be impossible, for there could be no exchanges of commodities; in a community of goods, every thing would belong to every body; no one would have any production which he could call his own, and which he would be entitled to exchange for the production of another man. We should thus be deprived of one of the chief advantages of civilised life. When a man is from necessity his own tailor, tent-maker, carpenter, cook, huntsman, and fisherman, it is not probable that he will be expert at any of his callings. Hence the rude habitations, furniture, clothing, and implements of savages, and the tedious length of time all their operations require.

Upon these several accounts, we may venture, with few exceptions, to pronounce, that even the poorest and worst provided, in countries where property, and the consequences of property prevail, are in a better situation with respect to food, raiment, houses, and what are called the necessaries of life, than any one in places where most things remain in common.

Against the institution of property, it is urged that it is the source of *competition* among mankind. This, on reflection, will be found a recommendation. Property is mostly the reward of ability, sobriety, and perseverance. Without its stimulating agency, we should have little eminence, social, moral, or intellectual. The innate tendency of man is to repose, not to persevering exertion; and if superior application, superior enterprise, or superior endowments, were not rewarded, few would sedulously devote themselves to trade, agriculture, manufactures, and the useful arts. In pursuit of these, an honourable—not a greedy, short-sighted, and fraudulent—spirit of competition is salutary, by stimulating invention and rivalry, which tend to general cheapness, excellence, and accommodation.

For competition, Mr Owen would substitute *co-operation*. But do not the several classes of society already co-operate in the most advantageous manner for the common benefit of the community? One class is occupied in rural industry, another in manufactures and commerce, another in science and letters. Each is rewarded, not always perhaps, but mostly, in proportion to desert; but the claims of merit would not be recognised under Mr Owen's system; the indolent would reap the rewards of the industrious, the vicious of the more deserving. This is more like *corporation* than co-operation, the principle of the old monastic institutions and commercial monopolies—associations of whose stagnating, debasing, and injurious tendency, the world has already had sufficient experience.

Rousseau, the Abbé Mably, Godwin and Paine, have objected to the institution of property, the *partiality* of its advantages. They allow that it is advantageous to those who possess property, but contend that it is disadvantageous to those who have none. 'It has tended,' says Paine, 'to make one part of society more affluent, and the other part more wretched than would have been the lot of either in a natural state.' The radical difference between the civilised and natural state is, that, in the latter, *all are poor*—all are in a state of discomfort, insecurity, and privation, and none are rich. But even in this state there is not exact equality of condition; all are not equally strong, dexterous, and persevering in fishing, hunting, and hut-building; and these inequalities of endowments produce inequalities in the rewards of their exertions. In the civil or natural state, no two individuals are exactly alike, either in mental or physical qualities; they differ in their habits as in their stature, complexion, and strength; and supposing an equality of possessions was at any time forcibly established, it could not possibly continue for a day or hardly an hour—some would be more wasteful than others, some more industrious and inventive. There may doubtless be institutions which tend to aggravate the inequalities inseparable from human nature; these institutions may have risen from the predominance of proprietary influence in legislation; but such abuses are wholly unconnected with the utility of the right of property, and the progress of society must necessarily tend to alleviate them; the right of property of itself is an unmixed and universal benefit. Without its protection, the rich would become poor, and the poor be unable to become rich, and all would sink to the same bottomless abyss of misery and barbarism. It gives no exclusive advantage—it only gives general security; it does not take from one to give to another, it only says to all—*labour, and I shall take care that none shall be permitted to rob you of the produce of your exertions.* 'It is the security of property,' says Bentham, 'that has overcome the natural aversion of man from labour, that has given him the empire of the earth, that has given him a fixed and permanent residence, that has implanted in his breast the love of his country and of posterity. To enjoy immediately—to enjoy without labour, is the natural inclination of every man. This inclination must be restrained; for its obvious tendency is to arm all those who have nothing against those who have something. The law which restrains this inclination, and which secures to every individual the quiet enjoyment of the fruits of his industry, is the most splendid achievement of legislative wisdom—the noblest triumph of which humanity has to boast.'"

CHARITABLENESS.

None of the principles which ordinarily actuate the human character is so amiable or so beneficial, whether applied individually or generally, as that which is distinguished in the sacred writings by the name of Charity. In this single word may be comprehended the whole sum and substance of a code of morals: all that the Grecian philosophers, in their various schools of ethics, taught to their pupils, or bequeathed to posterity, falls short in point of excellence of what is implied by this singularly comprehensive and expressive phrase. The sentiment indicated by charity, and which is eminently adapted for the regulation of social life, is exceedingly amiable in its character, for it produces that exalted disposition in our intercourse with each other which leads us on all occasions, and at all times, to put the most favourable construction on particular actions, or on the general conduct of our neighbours. And it is the want of this urbane and beneficent virtue which produces the greater part of that mischievous animadversion so commonly indulged in when speaking of the fortunes or misfortunes of the rest of our fellow-creatures.

To be charitable, in the true acceptation of the word, is to think no evil—to utter no vicious splenetic remarks—to have always in remembrance that human nature is composed of many contradictory qualities—that those who do behave with impropriety have perhaps been labouring under a variety of temptations, from which we ourselves were happily exempted—and that even the greatest criminals have often about them many points allied to virtue or goodness, of which others in the respectable walks of life are possibly in some degree destitute. We believe there is absolutely none who will not own that charity, in the sense we have put upon it, is not of all sentiments the most excellent, and the most worthy of cultivation; yet—and we speak without asperity—how few do we find that are willing to allow it full effect upon their words and actions! There is hardly an individual in the whole circle of society, and certainly not a single family, who does not occasionally smart under uncharitable suppositions of evil—who does not complain of the impertinent misconstructions of their neighbours, yet, curiously enough, who does not, most likely, abstain from indulging in the very same species of uncharitableness about which they are heard to utter such loud lamentations when it is directed against themselves. The truth is, that uncharitableness in a great measure proceeds from a want of thought, or, correctly speaking, from the want of moral discipline. Out of the mere lack of something else to speak about, people, when they meet together, sometimes let loose a variety of observations on the apparently improper conduct of others, without at all remembering that they are not perfectly acquainted with all the remote causes and proximate circumstances which produced that description of conduct, however obvious it may appear to have been. In the same manner, for want of calm reflection and investigation, people are apt to treasure up in their minds a bad opinion of others, for some imaginary impropriety; whereas, if they were to reflect soundly, and make a rigid inquiry into motives and governing circumstances, they would perhaps find that those they were about to blame, or had already uncharitably accused, were in point of fact free from all imputation of offence, and worthy of their deepest commiseration and respect.

In order to avoid being chargeable with this great offence in morals, it is imperatively incumbent upon us to think no evil of our neighbours, and to put forth no sarcastic or invidious remarks upon their habits of life. It is an excellent, and certainly a safe maxim, worthy of being followed, "to say nothing at all of a person, if we cannot say any good of him." If we do not approve of his behaviour, and have it not in our power to bring him to a better sense of his duty, let us rather endeavour to banish him from our recollection, and leave him to work out his own punishment, than try to enlist others in the same opinion with ourselves. Let us, moreover, recollect, that every one has some peculiarity, the result of natural character or education—that we ourselves have faults, and have committed errors, which it would pain us exceedingly to hear were the subject of the slightest sarcasm, or of any thing like serious rebuke. Who among us can search the hearts of others, and there see the secret agonies endured for indiscretions long since committed, and since hourly repented of? Who, by investigation the most searching, can discover the extraordinary concatenation of trivial events and temptations which often undermine the most exalted rectitude, and place those not originally or innately vicious at the bar of public opinion? No one, indeed, can do so. How much need, therefore, is there for the practice of charity on all occasions, under all circumstances, even the most liable to suspicion!

In applying the practice of charity to the every-day affairs of life, there is assuredly nobody but would less or more feel its beneficial influence; and if carried to its proper limits, it is unquestionable that human society would exhibit a perfection and degree of comfort which at the present moment it by no means possesses. But, to produce any tendency to this pleasing result, it is essential that every one should endeavour to put the rule in practice. Each must begin to scrutinise his own will and conduct, and not only resolve not to think invidiously of his neighbours, but instantaneously carry his resolution into effect. If we happen to see an acquaintance living in a style we do not approve of, let us first consider if he cannot well afford it, or is not necessitated to do so from some particular circumstance affecting his situation in life. If we hear of any one having committed a fault, let our first impression be that he will soon be sorry for it; and that to speak of it again to another would be attended by no beneficial effect. If we hear of any one differing materially from us in opinion upon any abstract subject, let us believe that he does so conscientiously, and not from mean or interested motives. We too frequently forget, in judging of the opinions of others, that nothing is so delusive, nothing so dependent on chance circumstances, as that which constitutes *opinion*, which, on a little investigation, we find to have arisen from the locality of our birth or place of residence, the era in which we live, or the education we have received. Let us then, we say, be careful how we ridicule or pointedly condemn ideas which are so formed, and, therefore, in all probability, conscientiously maintained.

If such be the nature and tendency of charitableness, the question may possibly arise, whether any species of animadversion may be safely made on the conduct of the vicious. This difficulty, however, can be easily solved. The existence of a discreetly-formed public opinion is obviously a severe and proper check on the progress of error, and such is not to be condemned; for the dread of censure is, in its way, a motive for virtue. But let us recollect, that, at the utmost, we must only venture to censure when we have fully satisfied ourselves as to the merits of a case, and when, on deliberate conviction, we think that so to express our opinions is in accordance with our duty to society. It is that idle clamant censoriousness—that reckless disposition to view the conduct of

our neighbours in the worst possible light, without troubling ourselves to investigate into the truth of the report that we may have heard—that love of retailing and whispering stories, tending to wound the character and feelings of our fellow-creatures—that liability to feel aggrieved by observations which meant nothing to our hurt, which deserves reprobation, and which called forth those beautiful observations on the excellence of charity from the greatest moralist by whom this earth was ever adorned.

MOORISH MANNERS.

Sir Arthur de Capell Brooke, whose landing in Morocco we have already noticed, proceeds to describe the appearance of the Moorish ladies, and manners of the country:—"A singular custom is observable among both Moorish and Arab females—that of ornamenting or tattooing the face between the eyes with clusters of bluish spots or other small devices, and which, being stained, become permanent. The chin is also spotted in a similar manner; and a narrow blue line extends from the point of it, and is continued down the throat. This kind of tattooing is intended to add a brilliancy to the countenance, and, indeed, it is by no means so disfiguring as might be supposed. In addition to this, the eyelashes, eyebrows, and also the tips and extremities of the eyelids, are coloured black by means of antimony, which certainly adds to the expression of the eyes. Lastly, the soles, and sometimes other parts of the feet as high as the ankles, the palms of the hands and the finger-nails, as well as those of the feet, are died of a yellowish-red with the leaves of a plant called henna. The back of the hand is also often coloured and ornamented in this way with different devices. On holidays, and at times of festivity and rejoicing, they paint their cheeks of a red-brick colour, frequently in the shape of a triangle, over which other devices appear in deep black, a narrow red line being also drawn down the temples. The effect is singular, but not so unbecoming as would be imagined. The hair, which is sometimes plaited with flowers, is divided into two parts or tails, which being parted hang down over the neck and bosom.

The costume of the Moorish females is rich and highly ornamented. The robe or kaftan of fine scarlet or blue cloth is richly worked in front at the bosom and down the skirts in gold. On great occasions two and three of these are worn, the inner one being of fine linen; and their embroidered edges being shown, give the appearance of under waistcoats richly worked. Around the waist is worn a broad silk sash also worked in gold. The head-dress is formed by a black crape scarf, which is tied round the head; the ends, which are worked in gold, hanging down behind. Over this is a rich silk Fez handkerchief, folded broad, so as to form a kind of high turban, coming to a point like a tiara, over which three or four narrow bracelets of pearls and precious stones encircle the forehead, and have a rich effect: the necklace is also of precious stones; not being suspended low, but worn tightly round the neck. Massive silver collars or armlets adorn the wrists, and a similar ornament is worn round the ankles. The ear-rings are usually of gold, the armlets likewise being sometimes of the same metal. Dress slippers are made of blue or green or crimson velvet of the Fez manufacture, and embroidered in gold. The colour of the common slippers, which are of morocco leather, is red, yellow being that worn by the men. The dress of the lower orders, when within doors or on the terraces, where I have frequently had opportunities of observing them, is usually a loose kind of linen shift with very wide sleeves girded round the waist, and loose linen drawers.

The appearance of the Moorish women when in the streets is very singular and remarkable. They are then completely enveloped in a white hayk, which being folded in a peculiar manner round the body, is turned over the head, and the folds being brought over the face, are held in one hand so as entirely to conceal every part, except the left eye, to enable them to see their way.

The hayk, which is an article of great manufacture in Morocco, is worn by both sexes, and is of different textures, the most expensive being as fine and transparent as gauze. The kind which is worn by the lower orders may be termed a sort of fine blanket; it is usually about four yards in length, and a yard and a half broad and is therefore capable of concealing every part of the person except the legs, which are bare and exposed."

The author thus describes the marriage ceremonial of the Moors:—

"Nothing appears more extraordinary to a European on his first arrival in the country, or impresses him more forcibly with a conviction that he is among a barbarous race, than the marriage ceremonies. The Moor marries when corn is plentiful. This was now the case, the harvest having been most abundant; and the number of weddings that were celebrated every night, according to the custom, kept the town in a state of continual rejoicing and uproar. A soon as it was dark, the narrow streets of Tangier were literally blocked up by moving crowds, whose steps were illuminated by numberless lanterns, while their ears were regaled with irregular discharges of guns, relieved, if it could so be called, by the barbarous notes of the Moorish instruments.

To give, however, a more detailed account of this curious ceremony, which is divided into several acts: the first part of it that I had an opportunity of witnessing was the bearing of the present from the future bridegroom to the parents of his intended. The former walked at the head of a numerous procession, in the midst of which three black female slaves bore on their heads vessels containing cloth, muslin, and other stuffs, tied up in silk bands; an enormous dish of kouskous then followed; the rear being brought up by two horses and a mule laden with wheat and barley.

Previous to the wedding, a procession is formed at night by the bridegroom, who is conducted by his friends, arm in arm, through the different parts of the town, accompanied by music and firing. The concluding and most singular part of the whole ceremony is the bridal night. On this occasion the bridegroom, on leaving his own house, attired in his white sulham, or cloak, and with his sword girded before him, proceeds on horseback towards the quarter where his intended resides; he is accompanied by large bodies of his friends and connexions on foot, bearing lanterns in their hands, and is attended by two boys, who keep throwing handkerchiefs towards him, as if in the act of fanning him; the procession being headed by a band of music, consisting of the Moorish tambour, or drum, and two or three hautboys, from which the most detestable sounds proceed. The approach of the procession is announced by loud discharges of guns; and it having arrived at the house of the bride, it stays there until she is ready, the bridegroom remaining on horseback, and the whole length of the street being thronged by the accompanying crowds.

The door of the house is now thrown open, and a kind of wooden cage, with a conical top, and not unlike a small pulpit, is brought out, containing the fair bird. This is hoisted on the back of a horse stationed ready to receive its precious burden, and led by a slave. This part of the operation is not accomplished frequently without some difficulty, on account of the weight of the cage, but more particularly of that of its fair inhabitant, who, according to the Moorish taste in this respect, not unfrequently weighs as much as the animal who has the felicity of bearing her. Should the bridegroom have been married before, the wedding is not near so brilliant, as he remains at home to receive his bride; and should the latter be a widow, she does not ride, but is conducted on foot by the women to the house of the bridegroom.

The bride being on horseback, the whole procession, which by this time has been very considerably swelled, proceeds at a slow pace through all parts of the town, winding along the numerous dark alleys and streets, which are scarcely wide enough to admit a person on horseback. The strangeness of the spectacle is such, that a Christian observing it for the first time would scarcely suppose that he beheld human beings. Fancy the procession in motion, and a concourse of figures attired wholly in white, proceeding at nearly midnight perhaps, at a slow funereal pace; in the rear numbers of men, armed with guns of an enormous length, deafen you with repeated irregular discharges of powder, firing at the feet and faces of the spectators, dancing at the same time, and making use of the most extravagant gestures.

The music now advances, and your ears are greeted with sounds as diabolical as any savages ever made, which are produced by the instruments before mentioned. A confused crowd of persons now approach, with lanterns in their hands, in the midst of which is seen the bridegroom on horseback, his face muffled up, and his sword now girded behind him, and followed by another horse bearing the strange machine already described. The rear of the cavalcade is brought up by several women, who accompany the bride to her new habitation, while an indiscriminate crowd of persons follow. The procession does not proceed direct to the house of the bridegroom; if it did, the ceremony would be all over in a few minutes, and the effect lost; on which account it is first conducted through all parts of the town, and from the slowness of the pace at which it proceeds, and the crowds that accompany it, it is frequently an hour or more before it reaches its final destination.

On arriving at the house, a general halt is made, the bridegroom dismounts and enters his habitation, and the box which contains his better half is carried in at the same time; the door is then shut, and thus terminates the ceremony. Large dishes of kouskous are afterwards brought out and distributed to the crowd, and the firing and rejoicing is often kept up a great part of the night. Among the poorer classes the whole affair lasts only two or three days, but is prolonged should the bridegroom be wealthy; it being usual for him to invite his friends and acquaintance to an entertainment; and thus the rejoicings conclude."

The ignorance and superstition which prevail among the Moors are of the most deplorable description, and of which the following instance is sufficiently illustrative:—"A Jewish woman at Tetuan being afflicted by a violent swelling behind her ear, imagined that it was caused by the agency of the devil, whom some one persuaded her she had offended unconsciously, by having thrown one night into the yard some hot ashes and water, which is considered by these poor weak people as a most marked affront to his satanic majesty. In order, therefore, to appease his devilship, and relieve herself at the same time from the pain she was suffering, which was occasioned by a severe cold, she, assisted by her friends, proceeded, in the first instance, to boil a quantity of kouskous (a kind of porridge), which they threw, at the same hour of night as when the offence had been given, and in the same part where the ashes had been thrown, leaving it to remain until morning. The swelling and pain, however, still continued; and imagining that the gentleman in black was determined not to be bribed so cheaply, she sent for a Moorish conjuror from Sus, who had a high reputation for his magical skill. The man upon his arrival immediately proceeded to work, setting himself down, and making all the necessary inquiries—how she had been so unfortunate as to offend the worthy gentleman below, or, as the Moors style him and the rest of his family, 'the people beneath;' asking her, at the same time, whether she had been vexed from any cause, and had thrown down any thing on the floor with violence, or gone out in the dark without a light, as in that case she might possibly have trampled upon some of his majesty's subjects without being aware of it. To these interrogations the credulous woman replied, that she had only thrown the ashes into the yard as before stated, and that she had dreamed one night that some one had fired a gun in her ears. The conjuror now had heard sufficient cause for the woman's affliction: and having received his fees, which amounted to a pretty good sum, commenced operations by writing in Arabic some words on a paper which he afterwards dissolved in water. The next thing necessary was for the patient to swallow her own words, namely, the mysterious sentence thus dissolved, which he made the woman drink up. All this, however, had no effect. The following day the learned doctor came to visit his patient, and found, I will not say to his surprise, that her complaint remained unabated—in short that she was as bad as ever. Upon this he drew a circle on a white plate, in the centre of which he traced several mysterious signs with his pen, and after the ink had been allowed to dry, it was washed off the plate with cold water, and drank by the patient. The operator then took his leave, with the assurance that this would not fail to cure her. The following day he again made his appearance; and finding no alteration for the better, he gave her several perfumed seeds, muttering some incantations at the same time, and leaving with her a supply of the said seeds, charging her to perfume every part of the house with them after nightfall, and not to omit a hole or corner.

Notwithstanding all his skill, his patient, as may be imagined, did not experience the relief she had so sanguinely anticipated; and seeing this to be the case, she called in farther advice in the person of a Moorish woman, who, upon seeing her, pulled out a book, in which after reading for some time with great attention, she informed her new patient that the volume had discovered to her that she had certainly offended 'the underneath people,' and that, in order to appease their anger, it was necessary that a second dish of the finest kouskous should be prepared with the greatest care, and thrown, not only about the yard, but about every part of the house, even to the street-door. The patient was enjoined, while she scattered the dish, to exclaim, 'This is what your friend presents you with, so pray be quiet, good people, and forgive me if I have offended you.' This ceremony was to be repeated for three successive nights; and if the desired effect was not produced, the house was to be sprinkled over with sweet oil at night, pardon being asked as before. Should this be of no avail, she was commanded to get all her friends and relations to spit into a glass—men, women, and children, which friendly contribution she was enjoined to drink off in a cup of coffee. All these different prescriptions were implicitly followed by the poor credulous woman to no purpose. The second doctor had already, like the first, fleeced her out of a pretty good sum of money in the shape of fees, when a European Jew coming to reside in the same house, and hearing an account of the transaction, could not avoid pitying the poor woman, and reproached her and her friends with their folly and credulity, as well he might do. Upon this they begged him to see what could be done for her; and having fortunately some slight knowledge of the healing art, he immediately applied a poultice, and in a short time the swelling began to ripen, and the pain greatly abated in consequence. In this state of affairs the first doctor, the conjuror—who had, however, proved himself to be no longer one—came to pay her a visit, to see if he could not still extract something more from the patient's swelling wherewithal to swell his own pockets. The poor woman, in the joy of her heart at the relief she had experienced, and prompted at the same time by natural feelings of anger and mortification, told him to his face, that while all his art had been of no avail, the skill of a European had nearly recovered her. This, as may be supposed, threw the Moorish doctor into a violent fury: and he told her that by his power he would make her worse than ever, and that, if the swelling ever broke, he would consent to be called a Jew with a black cap, which is the greatest abuse that can be offered to a Moor. This was said in presence of her kind friend the European Jew, who, attaching as much weight to his threats as they deserved, continued his attentions, and in the end entirely recovered his patient.

DOMESTIC DUTIES.

We have more than once commended the propriety of wives attending to the various duties of their household, for nothing can be more respectable in its way; but in inculcating this principle, it is necessary to remind our female readers that it has its limitations, especially when applied to those in the higher circles of society. It ought to be remembered that the extreme of minute attention and of luxurious indulgence are equally improper, and ought to be avoided. On this subject, Mrs William Parkes, in her excellent work, entitled "Domestic Duties, or Instructions to Young Married Ladies,"* makes the following useful observations:—"We will turn from this lamentable picture [that of a dissipated and ruined lady of fashion], to inquire whether the opposite extreme of conduct ought not, also, to be avoided, by which I mean the abandonment of a woman to household concerns, and to the over-solicitous care of her children, involving her in an entire neglect of the duties connected with social life and good neighbourhood.

I have in my recollection an instance which may, perhaps, exemplify the error in conduct of which I am speaking. Mrs C——, in whose neighbourhood I lived in my youth, considered herself as a pattern of wives and mothers, making it her boast that she combined the good housewifery of former times to the maternal care and attention for which the present age of mothers is remarkable. Her husband was a man of property; but, if rendering him happy in his home, and respectable in the eyes of his neighbours (as far as depends on a wife), should form some part of a good wife's care, she certainly did not sustain the character. Considering the extent of her husband's property, her economy approached to meanness. Her table was always so scantily provided, and such strict limitation of every article throughout her establishment was enforced, that poverty seemed an inmate, while comfort was banished from her house. For the *glory* of being accounted a thrifty manager, she submitted, and obliged others to submit, to many privations; and often she was obliged to share the labours of her household, which she preferred to the expense of keeping a proper complement of servants. At no period of the day, which was shared between household and nursery cares, could her husband promise himself her society, and, in the evenings, he generally found her wearied and fretted by the petty concerns of her life. For visiting or receiving company she constantly declared she had no time; and, indeed, she at length acquired a disrelish for any society which was not comprised within her narrow scene of action.

A life of retirement soon renders us unfit and unwilling to mingle in general society. The exertion both of mind and body in which company engages us, we seldom think compensated by the degree of pleasure we receive from it, when from seclusion we have lost our relish for topics of general interest. Our thoughts and feelings are too much wrapped up in our own concerns, and we become devoid of that sympathy in the tastes, feelings, and concerns of others, which gives the chief interest to our intercourse with our fellow-creatures. Natural obstacles, a sea flowing, or mountains intervening between friends, are not more effectual barriers to the interchange of ideas and feelings, than the want of sympathy and common interest in each other's welfare.

The unenvied husband of this *good wife* sought amusement any where but at home. He spent much of his time either in field sports or in the more dangerous pleasures of the turf and the gaming-table. His wife's confined view of her duties prevented her from anticipating this effect of her management, nor indeed did she ever imagine herself as in any way the author of her husband's failings. Her children, also, both mentally and physically, were sufferers. Her imagination, not allowed to range beyond her domestic circle, fed itself upon the supposed diseases of her children, which, I believe I may justly assert, were more often engendered in their constitutions, than averted by the measures and precautions which her over-solicitude prompted. Their tempers were injured by injudicious indulgence at one time, and by the fretfulness which her cares induced, and which she could not always restrain, even towards the objects of those cares. Her servants, too, were not amongst the happiest of her family; her principle in regard to them being, that they ought to belong to a 'much-enduring race,' to work hard and fare hard.

What effect this lady's character might have had upon her offspring, cannot now be known, as consumption rapidly terminated her life. It was the opinion of her physician that this disease had met with encouragement from the restless anxiety of her mind, and the frequent over-exertion of her strength. Her death occasioned but little feeling in her neighbourhood: few tears were shed, few regrets expressed, for one who had made no attempts to attach others to her, or to perform any of the kindly offices of good neighbourhood. Her equals lost no friend when she expired, the poor no benefactress.

There are many ladies who, though they do not carry their conduct to the extreme which I have just described, yet, in a degree, err in a similar manner, and suffer their minds to be too much engrossed with similar cares. They build a wall around them, and confine within it their ideas, prospects, hopes, and expectations, and can imagine no happiness nor good to spring beyond it.

I hope I have exposed with sufficient force the danger and inconveniences which arise from either of the extremes in conduct, which I have attempted to describe. Instances still more lamentable might have been adduced, but as I trust they have generally been peculiar cases, connected with a strange perversity of disposition, their examples need not be instanced to those in whom no such depravity exists. If I have prepossessed you in favour of a middle course, I shall be contented. Society has various claims upon us, and these may in most cases be satisfied without any omission or neglect of higher demands upon our time and attention. To economise time, to avoid frittering away any great portion of it on trifles, or with listless indifference to suffer it to pass away unemployed; to perform strictly the duties of each day, so that no occasional pressure of employment may hurry you into a hasty and careless method of proceeding; these will be the best means of insuring you time for the demands which may be made upon you by society in general."

* Longman. London, 1828. One volume 12mo.

MASANIELLO,*

For a long time previous to the year 1647, the kingdom of Naples and Sicily formed a dependency of the crown of Spain, and was generally governed by a viceroy deputed by the sovereign of that country. It was a kingdom of considerable natural wealth and resources, but had been completely exhausted by oppressive taxes, imposed for the support of the Spanish wars against France. The people of the city of Naples, being light-hearted, and having few wants, bore up better under their burdens than might have been expected; but they were at length reduced to despair by an impost which was laid upon fruit and vegetables, which formed their chief and almost only food. The edict for this tax was issued on the 3d of January 1647, and during all the ensuing spring, the clamours of the people were incessant. Nor were there wanting some outrages, such as an uninstructed populace are apt to commit when they are violently dissatisfied with their government. The symptoms of discontent became at length so alarming, that the viceroy, the Duke of Arcos, considered it safe, at the risk of still farther increasing it, to forbid the annual procession in honour of St John the Baptist, on the 24th of June, lest the concourse should lead to open insurrection.

Among the populace at this time was a young fisherman, who observed and shared deeply the general discontent. His anger and resentment had been roused by the rough treatment which his wife had experienced from the tax-collectors, who, detecting her in the act of concealing a small bag of flour in order to evade the payment of the duty, had put her in prison. Her husband paid a fine in order to obtain her release, but swore vengeance upon the oppressors; and was not long in finding the opportunity of fulfilling his vow. This man's name was Tommaso Aniello, or popularly Masaniello, for whom fate had destined such rapid change of condition as never mortal underwent within the same space of time. He was of middle stature and handsome countenance, with lively dark eyes, short curly hair, a frank and bold address, noted among his companions for smartness and activity, and about twenty-four years of age. He wore a fisherman's blue jacket, with white linen trousers, a sailor's red woollen cap on his head, and was barelegged and barefooted.

Matters had arrived at this pass, and such preparations were made by the populace for the celebration of one of their great festivals, that already they had organised themselves in bands for the procession, and were thus unconsciously prepared for attacking the government. In this state of affairs, a large concourse of peasants and gardeners from the surrounding country came to market with a supply of fruits and vegetables; and these being rendered liable to the odious tax, the ferment came to a crisis. One of the aggrieved peasants took up one of his baskets of figs, and, throwing it down, scattered its contents about, at the same time exclaiming, "This belongs to me. I give it to you, my friends. Our tyrants shall have none of this at least." "Let them have some of it!" said Masaniello, who stood by his side, and, snatching up a bunch of figs, struck an officious tax-gatherer over the face with it. His example was instantly followed by his numerous companions. Masaniello then addressed them in bold and ready eloquence, such as the occasion demanded—conjured them to stand by him, promising, in the most decided terms, redress for the grievances of which they had to complain. They then commenced acts of violence, broke down and destroyed the booths of the tax-collectors, burst into the houses of such as were conceived to have enriched themselves by farming the imposts, and spread alarm through the whole city. Their numbers had by this time increased to many thousands, armed with weapons which they had taken from gunsmiths' shops, and wherever they could find them. They compelled the Prince of Bisignano, a Neapolitan nobleman, to go with them and act as their chief; but being shocked at their excesses, and alarmed for the consequences, he contrived to make his escape. They next proceeded to the viceroy's palace, forced their way into his presence, despite of his guards, and peremptorily demanded the abolition not only of the new tax on fruits, but of all other imposts whatsoever—demands which, under the immediate influence of terror, the viceroy assented to. They then destroyed the most valuable effects in the palace; and the viceroy with difficulty effected his escape from the tumult.

The populace now, by unanimous consent, placed themselves under the command of Masaniello, who was installed *Capo del Popolo*, or "Captain-General of the Most Faithful People of Naples;" and such coadjutors and counsellors were added (chiefly of low rank and infamous character), as appeared to him best qualified to assist him. He used little counsel, however; and by his directions the prisons were broken open, and the captives set at liberty; the few inhabitants who resisted were put to death; and one house, where there chanced to be a quantity of gunpowder, was blown up—an accident which cost eighty-seven persons their lives.

The Duke of Arcos was taken absolutely unprovided for this dreadful outbreak. The few soldiers he had were scarcely sufficient to guard the citadels of Naples; and a regiment of five hundred men was defeated and disarmed in an attempt to enter the city. Thus at bay, the duke endeavoured to open a negociation with the insurgents by means of a nobleman; but success had caused the multitude to rise in their demands. They required not only the abolition of all the imposts, but the restoration of all privileges bestowed upon them by the Spanish monarchs, and in particular insisted on the exhibition of a charter in their favour written in letters of gold. The duke, in endeavouring to pacify them, showed another document, which he tried to palm upon them as the real charter which they sought. They became more exasperated than ever: they insulted the nobleman sent as mediator, and dragged him to prison; and followed their course of burning and destroying the houses of all whom they regarded as enemies of the people.

On the fourth day after the commencement of the revolt, and while the great mass of the insurgents were met in the public square, a conspiracy, formed to assassinate Masaniello, by means of a bribed body of banditti, was discovered. The appearance of so many mounted and armed robbers excited suspicion, and they were ordered to dismount and divide themselves. Instead of this order being obeyed, seven muskets were fired at the captain-general, so near that they burned his shirt, though not a ball touched him! The populace instantly discharged a volley of musketry on the troop of banditti, and killed thirty of them; the rest fled into a neighbouring church, which, notwithstanding the respect usually paid in Catholic countries to such an asylum, proved no place of refuge. The gates were unhinged, the vaults resounded to the fire of musketry, while the people slew the wretches at the very altar, flooding the church pavement with gore. Masaniello, meantime, remained in the great square, surrounded by the heads of the slain banditti planted on pikes, exaggerating the dangers which he had encountered, and calling for vengeance on the aristocracy, who it was discovered were the originators of the conspiracy. He particularly accused Don Joseph Caraffa as the chief instigator of the plot; and he falling into the hands of the people, was dragged before Masaniello, when a butcher struck off his head with a cleaver. The scene which ensued is indescribable. Horrid outcries rent the air; bleeding carcases were tied to horses' tails, and, attended by fishermen and sailors, were dragged through the street; children, covered with blood, ran behind, followed by women and lazzaroni, carrying the royal banners, and firing muskets into the windows. In the market-place was a wooden scaffold hastily constructed, and enclosed by a circular range of pikes, on which the insurgents fixed the heads of their victims, while their mangled bodies lay below, bound with ropes to the palisade. Masaniello ascends the scaffold, still dressed as a sailor, with sword in hand, his eyes staring, and foaming at the mouth. "Bring the head of the traitor!" he exclaims, and then insults the remains of Joseph Caraffa; he speaks to him in mockery, he touches his hair and ghastly lips, while the multitude raise the most ferocious acclamations. In all quarters victims are sought after; even the old and helpless are not spared, and their bodies are dragged about; the squares are covered with carnage, the streets resound with cries of affright, the palaces are in flames. The churches, however, are open; the altars are invested with the ornaments of the festivals for the dead; and before the Most High, priests and prelates call for peace, bewail the victims, and pray for the guilty. In passing by the churches, the ruffian who has just committed murder, or the incendiary who still brandishes his flaming torch, uncovers his head, kneels for a moment, and each returns to his work of destruction.

On the fifth day, the accommodation proposed by the viceroy, though somewhat checked by the conspiracy, was still proceeding. Assisted by two persons, Genuino and Arpaya, who had been formerly employed in political business, Masaniello had a set of articles

* We are indebted for the substance of the present sketch to an article in the Foreign Quarterly Review, for August 1829; a work which we cannot sufficiently praise for its solid and useful properties.

drawn up, in which the taxes were abolished, all former privileges renewed and confirmed, and the actors in the late tumults, including himself and his counsellors by name, assured of pardon. These articles were read publicly in the church of our Lady of the Carmelites, after which the Cardinal Filomarino passed in procession to the Castello Nuovo, followed by the whole tide of the population, amid loud acclamations. On this occasion, Masaniello, at the cardinal's suggestion, exchanged his mariner's habit, which he had rendered more awful than imperial robes of Tyrian purple, for a splendid suit of cloth of silver, and mounted on a fine charger, proceeded to pay his respects to the viceroy, who received him with the utmost respect, and had an opportunity to see the wonderful and alarming influence which this fisherman had attained over the populace. Vast numbers of the insurgents had crowded in after the procession, and filled the castle-yard. Alarmed at the length of Masaniello's stay, they began to show symptoms of uneasiness. The *Capo del Popolo* was then with the cardinal and viceroy in the cabinet of the latter, when, stepping to the window, he silenced them by a word of his mouth and a signal of his hand. At another signal, all the bells of the city were tolled; at a third, the deafening peal was silenced. He waved his hand, and the people shouted; he placed his finger on his lips, and the roaring multitude became hushed as death. Finally, he commanded them to disperse to their homes, and the courtyard, as if by magic, was evacuated in an instant. The viceroy and his courtiers looked at each other with astonishment. It was no wonder that the viceroy felt it necessary to recognise the authority of captain-general of the people in a demagogue possessing such complete influence over his constituents.

The events of the sixth day still proved that peace was far distant. Masaniello, agitated perhaps by apprehensions of the banditti, no longer received petitions and applications in the open market-place, but at a window of his own cottage, where he stood in his fisherman's dress, with a loaded blunderbuss in his hand, which put the suitors in some terror for the reply which they might possibly receive. The petitions which were presented to him, he himself being unable to read or write, were examined and answered by masked secretaries, who wrote the necessary reply, which the *Capo del Popolo* attested by a mark. His sentences, his executions, his burning and pillaging, still indicated his being thoroughly imbued by the implacable hatred to the aristocracy. The degree of power to which Masaniello had attained seems now to have begun to unsettle his reason. At a solemn religious ceremony he attended, he behaved in the most absurd manner, and was with difficulty prevented from stripping himself of his dress. His conduct became hourly more fantastic, and the respect of the multitude began proportionably to diminish. He one day suddenly rushed out to the streets half dressed, mounted his horse, and galloped off where caprice dictated—next rushed into a church to hear mass, after which he went and threw himself in the sea, and then ordered supper. He also drank deeply of intoxicating wines, and in his inebriation committed all kinds of extravagances.

The people of every condition were now agitated by a desire to be rid of their captain-general, and a new conspiracy was formed against his authority, which was more successful than the preceding. Upon the 16th of July, or the tenth and last day of his singular career, Masaniello, escaping from his best friends (those who detained him in custody as a lunatic), rushed into the church of del Carmine, the day being the festival of the Virgin patroness. The cardinal Filomarino performed the service, and after its conclusion, Masaniello, in a desponding mood, harangued the people with a crucifix in his hand; complained of being forsaken by them, mingling expressions which were of a pathetic description with such as were utterly irrational and ridiculous. He behaved with such indecorum of speech and gesture, that the priests were obliged to withdraw him from the pulpit by force. To the cardinal he next had recourse, expressing his purpose to resign all his power to the viceroy. The prelate with difficulty prevailed on him to enter the adjoining cloister, and cease interrupting the prayers of the congregation. While the unfortunate man was yet in the cloister, the assassins, few in number, but followed by many others who favoured them, burst into his place of refuge, exclaiming, "Long live the king of Spain, and death to Masaniello!" "Do you seek me, my people?" answered Masaniello. "Here I am!" As he turned round, he received the fire of four arquebusses, which killed him on the spot, giving him but time to exclaim, "Oh ye ungrateful traitors!" So low was his popularity fallen, that the thousands, then assembled in the church of del Carmine, heard, without the least emotion, that Masaniello was slain. Thereafter his head was carried to the viceroy, and his body, after being dragged through the streets by a rabble of boys, among whom the nobility threw pieces of money, was at length tossed into the city ditches.

But the flame which Masaniello had kindled was not extinguished by his death. Even in the morning which succeeded his exit, some of the striplings who had constituted the guard and lictors of their murdered captain-general, sought out his dishonoured remains, and carried them to the cathedral. The mangled corpse was arrayed in royal robes, decorated with a crown and sceptre, and after being carried in funeral procession, followed by thousands of armed men, it was at length solemnly interred in the church, with many tears, prayers, and lamentations.

Thus ended the short but eventful life of Masaniello, who, in the course of ten days, rose from the most humble situation to an unrivalled height of despotic authority; and after reigning like a monarch, was, by common consent, shot, and dragged through the city like a mad dog, yet finally buried like a prince, and almost worshipped as a saint.

It should be added, as explanatory of the conduct of Masaniello, that it does not appear, on the closest investigation, he ever contemplated the retention of supreme authority, or acted on any other plan or principle than the very obvious one of relieving his fellow-citizens from the pressure of their burdensome imposts.

FAREWELL TO THE DEAD.

[BY MRS HEMANS.]

Come near!—ere yet the dust
Soil the bright paleness of the settled brow,
Look on your brother, and embrace him now,
In still and solemn trust:
Come near!—once more let kindred lips be pressed
On his cold cheek; then bear him to his rest.

Look yet on this young face!
What, shall the beauty, from amongst us gone,
Leave of its image, even where most it shone,
Gladdening its hearth and race?
Dim grows the semblance on man's heart impressed—
Come near! and bear the beautiful to rest.

Ye weep, and it is well;
For tears befit earth's partings.—Yesterday
Song was upon the lips of this pale clay,
And sunshine seemed to dwell
Where'er he moved—the welcome and the blessed—
Now gaze! and bear the silent unto rest.

Look yet on him, whose eye
Meets yours no more in sadness or in mirth!
Was he not fair amidst the sons of earth,
The beings born to die?
But not where death has power may love be blessed—
Come near! and bear ye the beloved to rest.

How may the mother's heart
Dwell on her son, and dare to hope again?
The spring's rich promise hath been given in vain,
The lovely must depart!
Is *he* not gone, our brightest and our best?—
Come near! and bear the early-called to rest.

Look on him! is he laid
To slumber from the harvest or the chase?
Too still and sad the smile upon his face;
Yet that, even that, must fade!
Death holds not long unchanged his fairest guest—
Come near! and bear the mortal to his rest.

His voice of mirth hath ceased
Amidst the vineyards! there is left no place
For him whose dust receives your vain embrace,
At the gay bridal feast!
Earth must take earth to moulder on her breast—
Come near! weep o'er him! bear him to his rest.

Yet mourn ye not as they
Whose spirit's light is quenched!—for him the past
Is sealed. He may not fall, he may not cast
His birthright's hope away!
All is not *here* of our beloved and blessed—
Leave ye the sleeper with his God to rest.

GRAVEDIGGERS.

THE gravediggers of Edinburgh, like those of most other places, till a recent date, were remarkable for their drunkenness, in addition to the other vices common to their tribe. About thirty years ago, there was an obscure public-house at the head of the Cowgate, in which the greater part of them used to meet every morning to enjoy themselves. It was said that they were accustomed to drink most unhallowed toasts—such as "A hard frost"—"A wet spring"—"The east wind"—"A green Yule," &c. and converse upon the prospects of good employment held forth by the weather. On it being debated one morning whether they might sit a little longer, and have some more liquor, one of the corps is said to have voted in the affirmative, for a reason, which he expressed in the following words:—"Hang it," said he, "let us hae the other pot. The sky has been looking gay dour for this half hour past! we'll hae plenty o' caulds and sair throats the morn."

One of the oldest Edinburgh gravediggers whom we happen to remember was a man of singular manners and habits, named Jemmy Alexander. Jemmy was a most ingenious wretch: could make wooden clocks, clasp broken china, or turn his hand to any kind of employment, including that of a porter, which happened to come in his way. One of his most profitable businesses was that of a gravedigger in one of the burying-grounds of the city; and to make the most of this dreary profession, he enlivened his spare hours by making fiddles out of the bits of half-decayed coffins which he turned up in the course of his labours. Jemmy's fiddles were considered tolerable instruments within the latitude of the Low Calton and Greenside, and he was never long in disposing of them when finished. One of the best he ever sold, he used to mention, was one he made out of a piece of the coffin of a celebrated Canongate bailie, and which afterwards enlivened with its strains some of the most fashionable assemblies. Jemmy is himself long since dead and buried, and possibly the shreds of his own coffin may be some day similarly exhumed for purposes equally at variance with their former use.

The most remarkable of this fraternity was Geordie Girdwood, the ancient gravedigger of the Grey Friars' churchyard. He was an uncommonly drunken-looking, withered, little old man, with sore eyes. It was said of him, by the common people of Edinburgh, that he had, in the course of his professional duties, turned over the churchyard seven times. He died at an advanced age, about sixteen years ago. Like Blair's sexton, he had a great turn for wit; but, unfortunately, his conversation smelt wofully of *the shop*, and that smell was not the most pleasing possible. A friend one day made up to him as he was digging a grave, and found him contemplating a skull, which he had just unearthed, and was holding in his hand. Knowing that Geordie was quite as well acquainted with the faces of the dead as the living population of the parish of Grey Friars, the intruder asked him, "who that had been." "Ah! man," quoth Geordie; "this was the great preacher, Dr ——, ane of the ministers of Edinburgh. He was weel kenn'd to be a queer minister in his day. He could drink glass for glass wi' a large dinner party, till they were a' aneath the table but himsel; and he would then go into another room, call for the servants of the house, and give them a discourse, as weel as if he had never tasted a drap. Ah, he's been lang dead and gane noo! Od, I believe, I've haen him sax times in my hands since I pat him first aneath the yirth! Deil care how mony mae times I may hae him to turn ower yet!"

So much for the ancient fraternity of gravediggers—men whom we all need, but whom no one loves.

DUCK-SHOOTING IN CANADA.

The Camerons were the best hunters I ever knew in Canada. They were brothers, of Highland extract, hardy fellows, and extremely fearless: they would go out a-deer-hunting, and sometimes bring home fifteen in a couple of days. As for shooting ducks, they were unmatched, and filled the canoe with large fat fowls when nobody else could get a shot: they would go out on a morning and procure four or five dozen with ease. The black wood-duck is the best of all the wild-duck tribe; it is of a sooty colour, with a dirty yellow speckled breast, and nearly as large as a goose. They feed on the wild rice, which grows plentifully in the small streams in the remote woods; they are not met with in large flocks; many of them remaining during summer, and are met with large broods following after them. One of the Camerons having observed a large flock of wild-geese on the lake of the Chaudiere, used every means in his power to have a shot at them, but could not: he crawled round the rushy banks from one point to another, but it would not do—still the flock kept aloof, and vexed him with their shyness. At length he took his canoe, and having cautiously got into it, allowed himself to drift out into the Big Bay towards his prey; and when he had got, as he considered, within shot, he let fly, and, dreadful to relate, the canoe upset from the percussion of the musket, and launched the keen sportsman into the deep. This, however, did not concern him much; instead of clinging to the canoe, or even catching a paddle, as many others would, he quietly swam ashore, without saying a word, with the *gun* in his hand, a distance nearly of a mile. His brothers on the bank did not seem at all alarmed: they got out on a point, and rode a tree to the canoe; that is, took a branch of some one or other that had tumbled down—these are always in superabundance—sat on it as we would on a saddle, and paddled away in the water to the canoe, which having uprighted, they easily succeeded, with the aid of the branch, in embarking by the stern when away they hunted the wounded wild-geese and brought a good shot ashore, where, on arriving, they found their brother had prepared a fire, was drying his clothes, and broiling something to eat.—*Mactaggart's Canada.*

PRIDE EFFECTUALLY REBUKED.

William Penn and Thomas Story, travelling together in Virginia, being caught in a shower of rain, unceremoniously sheltered themselves from it in a tobacco house; the owner of which happening to be in, thus accosted them:—"You have a great deal of impudence to trespass on my premises—you enter without leave. Do you know who I am?" To which was answered "No." "Why, then, I would have you to know that I am a justice of the peace." Thomas Story replied, "My friend here makes such things as thou art; he is the governor of Pennsylvania." The would-be great man quickly abated his haughtiness.—*Imperial Magazine.*

LONDON: Published, with Permission of the Proprietors, by ORR & SMITH, Paternoster Row; G. BERGER, Holywell Street, Strand; BANCKS & Co., Manchester; WRIGHTSON & WEBB, Birmingham; WILLMER & SMITH, Liverpool; W. E. SOMERSCALE, Leeds; C. N. WRIGHT, Nottingham; WESTLEY & Co. Bristol; S. SIMMS, Bath; J. JOHNSON, Cambridge; W. GAIN, Exeter; J. PURDON, Hull; G. RIDGE, Sheffield; H. BELLERBY, York; J. TAYLOR, Brighton; and sold by all Booksellers, Newsmen, &c. in town and country.—CHAMBERS'S HISTORICAL NEWSPAPER, a Supplement to the present publication, is published on the first of every month; and CHAMBERS'S INFORMATION FOR THE PEOPLE, of which every number is a distinct subject of human knowledge, appears once every fortnight.

CHAMBERS' EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF "CHAMBERS'S HISTORICAL NEWSPAPER," AND "INFORMATION FOR THE PEOPLE."

No. 103. SATURDAY, JANUARY 18, 1834. PRICE THREE HALFPENCE.

FLUCTUATIONS OF RANK AMONG MEN.

It is justly considered the mark of an ill-regulated state, when the humble are prevented, either by fixed rules, or by other circumstances, from rising into the more eminent situations. As there is evidently a new dispensation of intellect every generation, it is incontestibly necessary that provision should be made for the easy descent of such individuals among the well-born as are unfitted by nature for maintaining their original places, and for the easy ascent of those among the plebeian orders who are qualified to supplant them. Thus the higher departments of our social system will always be filled by the properest men, and the great designs of nature fulfilled.

There are few countries, perhaps, where this perpetual interchange of relative condition goes on so smoothly, or to so great an extent, as in Great Britain. The very highest situations, under the throne, are here found to be filled with men who have risen, by their native talent and force of character, from the lowest walks of life. It is remarked, however, with dissatisfaction, that most of these men, on gaining the ends of their ambition, cease to have any sympathy with their former equals, and display all the less amiable characteristics of an aristocracy with even greater breadth than those who inherit the honours of many generations. If this be the case, we are inclined to attribute it in a great measure to the fault of those who are left behind. The people in general do not, we think, treat those who have outstripped them in the race of fortune, in such a manner as to keep alive sympathy: the fortunate persons are tempted, we suspect, to assume as much as possible of the haughtiness of nobility, in order to confound, both to themselves and others, the disrespectful feelings with which they are conscious they are regarded by those who were once on their own level. All the lowly are anxious that channels should be open through which some of them may attain elevation; every man is more or less anxious that he should be one of the fortunate individuals. Yet, when a certain number have gained the desired height, they altogether cease to be considered as a part of the class they lately belonged to. Their former fellows look upon them as men fortunate only for themselves—as no better deserving of their honours than others who could be pointed out—as guilty, perhaps, of improper arts in procuring their promotion. Their original condition is perpetually raked up; and though many make a cold profession that the lower the origin the greater the merit of rising, still it is evident that distinction in the tenth generation, without merit at all, meets with more respect from the bulk of the community. The long-descended honour of a Howard or a Hamilton, is regarded with complacency, and its pretensions are at once allowed. But where greatness is borne by a man who lately was not great, and who is recollected to have once been as subject to the hardships and contumelies of a humble rank as any of those who are now considering his history, the deference due to his titles is yielded more reluctantly. In the former case, competition is foreclosed: in the latter, it is open, and every man thinks himself at liberty to call in question the amount of that merit which has raised another so much above himself. It is in reality the jealousy, envy, and detraction, which are brought to bear upon new greatness, by those who are still humble, that make it so eager to identify itself with the elder great, and so ready to cut off all ties with its former associates.

The evil, in our opinion, would be greatly lessened, if the people had more just ideas respecting those who elevate themselves above their original rank. They do not sufficiently cogitate the grand truth that the elements of greatness are born in all ranks alike, and that its pressing upwards from a mean origin, when such happens to be its lot, is nothing more than a process in conformity with the great laws of creation. Man has in some countries *made* nobles, who, for the supposed good of the community, inherit greatness by descent; but nature has her nobles too, and they are born sometimes in a cottage, sometimes in a palace, just as it chances. These individuals are often, by the pressure of circumstances, confounded all their lives with the commons of creation. But in other instances, they burst through all obstructions, and acquire that superiority over their fellows which nature, for their own good and that of the community, intended. If men were more generally to allow that this *carding* of the human race (so to speak) was just a part of the designs of Nature, they would be less disposed, we think, to look upon the original condition of the elevated individual as a thing either increasing or lessening his honour. They would regard both that, and the corresponding declension of the man who was unfit to retain his original place, as mere matters of course.

One great cause, we are persuaded, of the unworthy feelings with which the humble regard the recently exalted, is, the ignorance in which the most of men remain, respecting the secret and inner minds of those who are destined to rise above them. When we recall our early acquaintance with a man now our superior, we are apt to recollect only the mean circumstances with which he had to contend, his common subjection with ourselves to the ordinary evils of life, and the common-place behaviour which, like every other body, he exhibited in common-place affairs. We think, because he was environed in early life by sordid cares and paltry necessities, was connected with humble kinsfolk, and aimed only in the meantime at common objects of ambition, that he was all along and natively an ordinary person, and has only been fortunate in finding openings, to permit of that advancement which has been denied to ourselves. Now, in all probability, if we could have scanned the latent character of these persons, we should have found the most of them inspired from the very first with the sentiments, as they were possessed of the abilities, which were to raise them above us. Their easy submission to a mean sphere of exertion, and ready discharge of humble duties, we should have found to be only a proof of their possessing the materials of greatness—for by what other means could they have hoped to achieve their elevation! There no doubt are great souls of humble origin, which will not condescend to treat with mean circumstances, and, aspiring prematurely to the honours they think their due, leave no possibility of mistake on this point. But are these the successful men? No—they only excite ridicule, and obstruct their own advancement. The man truly designed and qualified to achieve greatness is too judicious to pretend to that which will not readily be conceded, too modest to suppose any lawful labour beneath him, too sensible of the necessity of a gradual course, to despise any of the steps that lead to fortune. He is, moreover, too much alive to the ridicule of assuming a manner above his present station, to discover those sentiments and aims, those ardent and lofty aspirations, which are all the time, perhaps, burning beneath the common-place of his aspect and deportment, and render him, even at *this* moment of lowly toil, as worthy of his honours as he will be when he has gained them.

We are inclined, then, to fix upon superficial observation, and ignorance of the laws of nature, as a chief cause of the jealousy which is entertained respecting the recently exalted, and upon this jealousy as the principal cause of the excessive haughtiness of that class of persons. Whatever have been the means of exaltation—state service, literary glory, scientific accomplishment—the elevated individual finds such a disposition among his late compeers to drag him back again into association with his original humility, and to hold his honours as cheap and paltry, compared with those which have been transmitted through a family, that probably he would give up all the distinction he has gained, and the merits through which he has gained it, with the greatest good will, if he could only make his grandfather a gentleman. It is not the fault of the parvenú himself, or of the system of which he becomes a part: it is the senseless propensity of the multitude to prostrate themselves before inherited, while they depreciate acquired honours, that causes him to make such haste in neglecting and despising them. This it was which made Congreve the poet so little anxious to be known as such, and so careful lest it should be forgotten that he was a man of quality. The public, who, after all, have the dispensation of honours in their own hands, since the title is nothing without their respect, have only themselves to blame, if they find the new illustrious more replete with all the worse features of the patrician character than the old. When they shall pay an equally ready respect to him who has gained his own honours as to his remote descendant, they will have less to complain of in the conduct of such persons, besides greatly increasing the incentive to exertion for the public good.

THE VICTIM OF INDISCRETION.

One of the most extraordinary circumstances connected with our outset in life, is, that actions of the most trivial importance very frequently govern our fate through the whole course of existence. The good or ill judgment that may sway our decision in some apparently unimportant occasion, is seen to advance or retard our success with an effect that excites the astonishment of those unacquainted with that particular which was the mainspring of our subsequent movements. The young and the heedless are not sufficiently aware of this remarkable fact. They do not seem to know that a total declension into the depths of vice is almost certain, after once being begun; and that, even if they retrieve their steps, they are preparing for themselves years of agony and remorse. They may be crowned with success in their career; they may rise to the highest honours that can be bestowed upon them as respectable members of society; yet the thoughts of their early indiscretions will still haunt them with vivid freshness. In the midst of a virtuous and happy family, they will be visited with the tortures of long-concealed vices, which, if known, would lower them in the estimation of all they held dear; and possibly, in their desperation, long for rest in the tomb, which they imagine will be the only extinguisher of their corroding cares.

I remember a short time since to have been occupied with such reflections, when I was disturbed by a loud knocking at the door. It was that repetition of hammerings a London hackney-coachman gives when he considers his fare to be a gentleman. My visitor was shown into the parlour. It was an old friend, although a much younger man than myself. I was startled by his sorrowful countenance, dejected air, and emaciated frame. After our mutual congratulations on meeting, he informed me he came to lay his bones with us—alluding to the family vault. I strove

to remove such unpleasing ideas from his mind, but he was so firm in his belief of a speedy dissolution, that I was rendered nearly as melancholy as himself. I remarked that death was the common lot of all, but it was unwise to have solemn contemplations ever shrouding our hearts—to seem as if we were always forming part of a funeral procession: death may have terrors, but let us live so as not to fear encountering them. This struck the chord that vibrated in his heart, accompanied with such an expression of remorse and agony, that I wished any other thought had escaped from my lips. I perceived I had made him wretched; the more I endeavoured to remove the impression, the more firmly did he adhere to the distressing subject. He called my attention to his haggard appearance, reminding me of what he had been; he spread his attenuated hand, telling me it was not what it once was; and, striking his breast, said, all within was more frightfully changed. He paused; I assumed what I did not feel, while I exerted myself to draw his thoughts to cheerful scenes and circumstances of our past days. He thanked me, while he informed me I imitated lightness of heart ungraciously, and requested of me to be *myself*, for he had some particulars he wished I would promise to see carried into effect. After some hesitation, I agreed, out of pity, to do as he desired; and arrangements having been made for his reception as an inmate of the family, he seemed to feel greatly soothed, and expressed his gratitude for our attention. It was some time afterwards before our guest could speak of his ultimate intentions. But, at length, one day he opened his mind on the subject he had so much at heart. He informed me he had accumulated a considerable sum of money, which he desired to place entirely in my hands as an executor, and that the will he had made, and which I would find in his repositories, would direct me how it should be distributed. Only one other request he had to make was, I would, after his decease—"and, oh!" said he, "that it may not be long deferred"—I would take care to place his remains beside those of his lamented and beloved wife. Being a relative of her whom he thus bewailed, I agreed to perform all that he so anxiously requested, and he became tranquil, while many events of his life were freely investigated, the substance of which was nearly as follows:—

My friend had been educated at a public school, and, having made considerable progress in the dead languages, was intended for the church. His father died under embarrassed circumstances, which introduced other views into the family. An uncle, who, by raising a number of recruits, had obtained rank as a captain, promised his nephew a pair of colours in his regiment. The thoughts of sword, sash, and epaulette, with their attendant vanities, gained ascendancy over the distant prospect of an obscure and melancholy curacy: my friend, therefore, accepted the red coat as a volunteer, and embarked with a detachment of recruits for Guernsey. His uncle followed with the remainder of the regiment, but, unfortunately, was captured, and added to the number of English at that time confined at Verdun, in France. It was long before this was ascertained in Guernsey: meanwhile, my friend became penniless, waiting for his commission. Reduced to the last extremity, he returned to London with the air and expectations of a military gentleman. His offended friends, unable or unwilling, rendered him no assistance as he danced attendance at the Horse Guards to learn the result of his memorials to the commander-in-chief. While he was becoming more involved in difficulties, he was informed of the death of his mother, and the last tie that bound him to what was once a home became severed; he stood alone, enduring the force of adversity, often satisfying his hunger with the chestnuts that grew in Kensington gardens, and allaying his thirst at the Serpentine river, till one day, looking at the window of a print-shop, from his knowledge of drawing he conceived the idea that he could surpass what he saw. He made application, and obtained employ—a day most delightful in his recollection; it enabled him to resume a cheerfulness to which he had long been a stranger.

He was eminently successful in his new profession—good hearted, intelligent, and an excellent companion. He formed intimacies with those of classical acquirements, who deemed his occupation degrading, and who prevailed on him to apply for a situation as tutor to a young gentleman then going on a tour of Europe. He was considered by the guardian too youthful, but was recommended to a baronet, whose son required private instructions in Greek. To render himself competent, he studied that language under one of his new companions. On the morning he was appointed to wait on the baronet, chance directed his study to a particular page of Demosthenes, in which he received much assistance from his companion. He hastened to his engagement, was shown into the library, and, after many questions respecting my friend's classical knowledge, the baronet, as if recollecting some particular passage in an author, took from its shelf a volume of Demosthenes, requesting my friend would construe a part which the baronet had difficulty in finding. My friend felt petrified during the search; but when it was found, it proved to be the page he had that morning accidentally been made acquainted with. He accordingly ventured boldly on the test of his abilities as a Greek scholar, and the result was successful. He was listened to, complimented, and engaged.

This he considered the knock of fortune at his door. He obtained many pupils; his reputation increased; his time was fully occupied; several youths, from his instruction, took seats on the forms of Westminster school, to the great satisfaction of their parents: he became intoxicated with success; and in the midst of so much good fortune, married a young lady remarkable for the sweetness of her disposition; but ere he had time to reflect on his unexampled prospects of happiness, the object of his affections died, leaving him inconsolable; the world seemed suddenly to present him scenes of woe, and periods of deepest affliction; yet the buoyancy of his heart returned; and, as if to present a relief to sorrowful remembrances, an offer, honourable and advantageous, was made to him, to accompany two young noblemen to Italy, as their tutor. This was in accordance with his wishes; he made arrangements, and sailed for the Continent.

He was, for a time, regular in his correspondence, constantly repeating desires to retain the lasting friendship of each relative of his departed wife; yet the intervals increased, till his letters were occasional: they interfered with his engagements connected with the frivolities of Paris or the dissipations of Naples. At times the natural goodness of his heart would revert to scenes of happy tranquillity at home, and he would sigh at being so far removed, but he was not proof against the allurements by which he was surrounded. Passion subdued discretion, undermined a heart that once beat with sincerity, and prostrated a mind once stored with dignity; the change was most deplorable. He was conscious of all; deeply wounded, he cursed the hour in which he left his humble occupation and his friends for Italy.

In a dreadfully shattered state of health he now appeared before me; during our conversation, a tear frequently stole from his full dark eye, and a deep groan left his throbbing breast; then would he pause and strike the table, as if reflection presented accusations, the justice of which he acknowledged, and he would stamp his own condemnation.

He would listen while his friends endeavoured to impart a hope he might recover, and he would smile at their representations of joys he might yet experience, when he resumed that station in our society which once he so admirably filled. "Never more—never more," he would repeat; "the past cannot be recalled."

Often would he bend to inhale the odour of a flower which he would not permit to be plucked for one so unworthy as himself. "Gracious God!" he would exclaim, "how could I till now be insensible to those lovely objects, and spurn those gifts the value and sight of which I shall shortly lose. My heart sickens at its own degeneracy."

His self-examinations were of the most severe character, and his reflections of the most poignant description. Reclining on his sofa, he would say, Man in various ways may be the instrument of his destruction, yet escape the odium of suicidal intentions; that improprieties might be countenanced till he could not perceive the horrid features of crime; that all he endured was just retribution, for nature was avenging her wrongs; that the prime of his life was blighted, and he drooped deservedly by premature decay. Reflections on his miserable state rushed on him with overwhelming power. He sought relief in piety, and in sincere repentance, till, soothed into tranquillity by hope for mercy, he patiently breathed his last; and the tomb merely tells where he rests, although in truth it might record that the only being he ever injured was himself.

The fate of this individual, however much to be deplored by his friends, must nevertheless be associated with the fact, that his sufferings, mentally and bodily, were caused by a course of reckless immorality, and therefore must be considered as just.

ANALOGIES IN NATURE.

Throughout the general system of nature, whether in the animal organization, habits, instinct, or intellectual endowments, which all the multitudinous tribes of the earth and ocean in a greater or lesser degree inherit, we may discern, without much difficulty of study, a wondrous analogy or resemblance. Although the difference in rank and local situation in which these varied tribes are placed, must necessarily require a distribution of these qualities in an infinite diversity of degrees, for the purposes of self-preservation and reproduction, yet even in the lowest and most insensate members of the animal world, a similarity in many cases may be observed with those which occupy the superior walks of living nature, and even with man himself. In this hypothesis the vegetable and mineral worlds may be included; and, although in minerals the resemblance may be indistinct, yet in the growth and after-changes which they undergo, a visible analogy may be traced with that of the organic kingdom.

The difference between inanimate and animated existence is marked and definite. A rock, for instance, is the work of chance, has grown by external accretion, and can only be destroyed by mechanical or chemical force. On the other hand, animal and vegetable life is alike produced by generation, are grown by nutrition, and are destroyed by death. Matter is apparently an inanimate body, comprising, in whatever form it may appear, a variety of substances of a separate and distinct nature from each other, and is constantly dying, reviving, decomposing into elements that confound and baffle all pursuit, and then recombining into other forms and other modes of existence. Metals are in like manner subject to the destroying hand of time; they become wasted, or converted into powder. Rocks crumble into small particles, and both powder and particles, by a series of after-operations, undergo fresh stages of decomposition, until every vestige of their original character is lost, and the elementary principles of which they were composed are appropriated to other purposes, and again spring up under new forms, and possessing other faculties.

Plants, like animals, are produced by generation, through the medium of eggs, generally called seeds. This seed is sometimes naked, but more commonly covered by a thin membrane, or pericarp. On this being removed, the seed is found to consist internally of a heartlet, and externally of a fleshy substance, surrounded by a double integument, sometimes single and sometimes bipel, and frequently more than bipel. These are commonly denominated lobe-leaves, or seed-leaves. This integument appears absolutely necessary for the germination and future growth of the seed, and acts like the lungs of an animal. Like the perfect plant, it possesses lymphates and air-vessels; through the former of these it absorbs the moisture of the soil into which it is buried, decomposes *part* of this moisture into its elementary principles, and conducts these principles, together with the undecomposed water, to the heartlet, which by this means becomes stimulated to the process of germination. The progress of vegetable life to maturity is marked with various proofs of a resemblance to animal organization. The stems and trunks of plants and trees contain a spongy cellular substance, resembling the spine of an animal, forming an admirable reservoir for the moisture necessary for the sustenance of the plant. Arteries and veins, some of which may be observed with the naked eye, are there, to convey the moisture throughout the general frame—vessels, for the introduction of the sap, or vegetable blood, to the interior of the plant, and others, for returning it to the surface; and by this arrangement is established in a sufficiently satisfactory manner the existence of a circulatory system. The leaves of a plant act in the same manner as the lobe-leaves of the embryo, and may be considered as the lungs or respiratory organs of the mature plant. In animals, the sap or chyle undergoes a change, to prepare it for assimilation (that is, being converted into blood, fitted to go through the general circulation, and nourish the several parts of the body), by the action of the atmospheric air, which they inhale by breathing. This process is performed by the same air, acting on the sap when it comes in contact with it at the stomas or pores situated on the leaves of plants.

Plants are also possessed of perspiratory vessels,

and in many plants the quantity of perspiration is very considerable. Keil, by a very accurate set of experiments, ascertained that, in his own person, he perspired thirty-one ounces in twenty-four hours. Hales, by experiments equally correct, determined that a sunflower of the weight of three pounds only, throws off twenty-two ounces of perspiration in the same period of time, or nearly half its own weight. To support this immense expenditure, it must be concluded that plants should be supplied with a larger quantity of sustenance than animals; and such has been ascertained to be the fact. Keil ate and drank four pounds ten ounces in twenty-four hours; the sunflower took in by its leaves and roots seventeen times more nourishment in the same space of time.

Plants are affected by poisons as well as animals, not by the medium of the stomach, but directly through the nervous system. Nux vomica, laurel-water, belladonna, hemlock, &c. &c., have successively been administered to different plants, either by watering them with or steeping their roots in infusions of these poisons. The universal effect was to produce a spasmodic action on the leaves, which either shrunk or curled themselves up; and, after exhibiting various symptoms of irritability, in a short time became weak, and in the course of a few hours expired. Plants are also susceptible of contracting habits. The *mimosa*, or sensitive plant, if placed in a carriage, closes its leaves as soon as the vehicle is put in motion; but after a short time it recovers, expands its leaves, and seems reconciled to its new situation.

It has also been ascertained that some plants sleep during the night. A celebrated botanist, examining in the evening a species of lotus, discovered that two flowers out of four which he had observed during the day had disappeared. By accurate search, he found that these two were hidden by their leaves, which had closed round them. This circumstance rousing his curiosity, he pursued his examinations in his garden by the light of a lantern, and found all the simple leaves of the plants had an arrangement totally different from that which they presented during the day, and the greater number were joined, closed, or folded together.

Plants have propensities, which, if not the result of instinct, are seemingly so nearly allied to it, that a more apt appellative can scarcely be found for distinguishing the faculty. Dr Smith, in his Introduction to Botany, says, that when a tree, an ash for example, happens to grow from a seed on a wall, it has been observed, on arriving at a certain size, to stop for a while, and send down a root to the ground. As soon as this root was established in the soil, and, consequently, a sufficient support obtained for the parent stem, the tree continued increasing to its proper height. Mr John Hunter sowed a quantity of peas and beans, with their eyes in different directions, in a tub, which he afterwards inverted so that the bottom was turned uppermost, while the mould was prevented from falling out by a fine net; and in order that the under surface might possess a stronger stimulus of light and heat to the upper, he placed round the mouth of the tub a number of looking-glasses, by which means a much stronger light was thrown upon the under surface of the mould than that shed by the rays of the sun on the upper; and, at the same time, he covered the inverted bottom of the tub with straw and mats, to prevent the mould from being affected by the solar influence. After waiting for some time, and perceiving no appearance of shoots from the under surface, he examined the contents of the tub, and found that they had all pressed upwards, and were making their way through the heavy mass of mould above them, and, where the eyes had been placed downwards, the young shoots had turned round, and taken an upward direction. He also sowed a number of seeds in a basket of earth placed on an axis, by which their position was altered every day. After two or three circumvolutions, he found the young shoots had made as many turns to obtain their natural upward direction; and where a pebble or any other obstacle had obstructed their ascent, they had made a curve to avoid them, and then continued their course.

Among animals, some are migratory, and others stationary and permanent; the same variety is observable in plants. Although mostly stationary, yet there are many that may be regarded as migratory or locomotive. The root of a scabious, for instance, if planted in a certain spot, will, after the lapse of a few years, be found to have left its situation and it will be perhaps only after a search which will lead the inquirer a distance of half an acre, that it will be found. Some male plants are known to sail from shore to shore over the water, in pursuit of those of the opposite kind, and numerous tribes float through the expanse of ocean. Many animals are amphibious, or capable of retaining life in either element; some plants possess a similar power—the oryza, or rice-plant, for example, and many of the rush and fucus tribes.

Animals of various kinds are aërial: many plants are of the same nature, and receive exclusively their support from air. There is one of those which, from its extraordinary properties, is worthy of being mentioned: it is called the aërial, and is a native of Java, and of the East Indies beyond the Ganges. The inhabitants of the latter region, on account of the elegance of its leaves, the beauty of its flowers, and the odour it diffuses, hang it up by a silken cord to the ceiling of their rooms, where it continues from year to year to flourish in all its pristine vigour, drawing its only nutriment from the surrounding atmosphere.

Fishes being the inhabitants of an element so foreign to the nature of that which is one of the principal supports to the existence of animal and vegetable life on the solid parts of the earth, must necessarily exhibit a different structure of organic functions, to that enjoyed by the animals of the upper world; yet, still in the general outline of their respective natures, and even in some of the more intimate features of their formation, they present a marked affinity. There are some fishes which are supposed to leave the waters, and traverse the land. A kind of perch on the coast of Coromandel is said to climb up palm-trees; and eels, it is well known, will leave their proper element during the night, to wander over meadows in search of snails and worms. Among the animals of the earth are found an immense variety of forms, feelings, propensities, and habits, which would become an almost endless task to enumerate; but it will be found that, among the inhabitants of the sea, a nearly equal diversity exists; and, what is more strange, that in almost every particular class that might be pointed out as belonging to one element, a corresponding class might be found in the other.

The most insignificant class of animals which inhabit the solid parts of the earth, is the worm species. They form the lowest rank of the insect tribe, being without a distinct head, and without feet; their most prominent organs are their tenticles or feelers. The tribes of winged insects form an almost infinite variety: they breathe through spiracles or air-vents, placed on either side of the head; are armed on all sides with a bony skin, or covered with hair; they are furnished with numerous feet, and have moveable horns which project from the body, which are probably the instruments of sensation. They inherit, in common with the superior classes of animals, a degree of instinct that seems more extraordinary when displayed by creatures apparently so insignificant, and so ill qualified for the exertion of that faculty. Their usefulness to mankind, although perhaps not generally noticed or appreciated, is far from being contemptible, and the instinctive forethought which they possess, when exerted for the welfare of their progeny, seems almost miraculous. The nut-weevil, when prepared to deposit her eggs, selects the green hazel-nut when its shell is soft and easily penetrated; this she pierces with her proboscis, and drops her egg into the nut through this perforation; this she continues to do, selecting a separate nut for each of her eggs, until her stock is exhausted. The nut not being materially injured, continues to grow, and when the egg is hatched, the maggot which is produced from it finds its food ready ripened for its use. When the mature nut falls to the ground, the insect crawls out by a hole which it gnaws in the side of the nut, and ultimately assumes the form of a winged insect of the beetle kind. The spirex or ichneumon wasp pursues an almost similar course; it deposits its egg in a hole which it bores in the sand; it then seeks out a small green caterpillar, which is found on the leaves of cabbage plants, which it slightly punctures with its sting, but so slightly as not to destroy life; it then rolls it up in a circle, and places it in the sand immediately over its egg, and continues this course until it has placed twelve caterpillars, one over the other, in the nest. It repeats this process over all its eggs; it then covers up the holes, and dies. The maggot hatched from the egg feeds successively on the twelve caterpillars, and by the time it has finished the last, it is fitted for the state of a chrysalis, into which it is converted, and ultimately becomes a winged insect.

Although the insect tribes of our own country present only an interesting and beautiful variety, yet in the equatorial regions of the globe they congregate in such hosts, as sometimes to produce the most calamitous effects: towns and whole countries are recorded to have been rendered uninhabitable by the inroads of multitudes of insects; and armies are said to have been compelled to fly before these feeble adversaries, rendered invincible by their numbers. But though, in particular cases, this immense congregation of animal life may be looked upon as an evil, and feared as a scourge inflicted by Divine Providence for natural dereliction, yet the beneficial purposes for which these myriads of creatures have been called into a transient being, are as undeniable as their effects may seem almost miraculous. The insect tribes, beautiful as they seem, are the grand scavengers of nature: wherever putridity may be found, they are there to devour the object from whence it issues; and such is the extent and rapidity of their exertions, that it has been calculated by some naturalists that the progeny of not more than twelve flies will consume a dead carcase in a shorter time than will a lion. And while some tribes are thus employed in destroying the dangerous masses of putridity which cumber the earth, other tribes, invisible to the naked eye, are busied in purging from the air those noxious particles with which it is sometimes impregnated, and which at certain seasons render it pestilential.

Among the bird species, we again find a similarity of intelligence, form, and propensity, with a uniformity of geographical arrangement with that of the vegetable world, and the other classes of animals which imbibe the same atmosphere. Birds, in their formation, seem to approach the order of winged insects; yet their organic structure is arranged with more simplicity, and they possess over the other a superior faculty of volition: their bones, harder and more numerous than those of fishes and reptiles, bespeak a more perfect organization: their wings seem calculated to free them from every local restraint, and to permit them to range at will over every part of the globe: the plumage which adorns and clothes them varies according to climate and to temperature; and in this again we may observe an affinity with them and the vegetable world.

THE PRESSED SAILOR.

WHY as for the matter o' that, what tar is there who doubts it? Every man must have his station, whether he is rigged in the gingerbread gear of lord high admiral, and has his thousands per annum, or only obliged to make a shift with a single purser's shirt. What does it signify, as long as he does his duty to his country, and stretches out a fin to relieve a friend in distress? We carn't all be kings and commodores, and so what's the use of grumbling? 'cause, as Jack says,

> "If you're signior, and I'm signior,
> Then who's to pull the boat ashore?"

Who, indeed? Now, d'ye see, I have been in the little boat all my life, going to leeward like smoke; for fortune, like a pig with its tail greased, always slipped through my fingers, and adversity took me slap aback, stand upon what tack I would. But don't think I mean to snivel or whine about it—Lord love you, no; where's the good on't? I might bawl a long while before any body would jam my mouth with a twopenny loaf, and pipe my eye for a month without getting a bit of 'bacca for my pipe. No, no; old Ben arn't the boy to up-helm at every squall, when, by keeping his luff, he can weather it, as our parson used to tell us: he used to say, says he, "My men, let Truth take the helm, Prudence trim your sails, and, with the compass of Honesty, enlightened by the lamp of Religion, hard indeed must be that gale, and horribly dark that night, in which Providence ceases to protect you. Your hulls may be wrecked, and your timbers shattered; but the immortal passenger within must and shall be safely landed in the haven of eternal rest." To be sure, some people float along the stream of time without encountering a single peril. They find it all plain sailing, and never have occasion to take in a reef, while others are constantly struggling against the squalls of distress, scarcely able to keep to windward off a lee shore.

Some are born great, others achieve greatness; and I remember one poor fellow of an Irishman who wanted to be great in a hurry. I belonged to the guardship at that time lying at Plymouth, and the impressed men and volunteers used to be sent aboard for the regulating captains to dispose of. Well, one day the new hands were all mustered aft, and the boatswain's mate stood ready with his clasp-knife to dock off the tails of the long-togged coats, and convart 'em into jackets. Among the rest was Mr Michael O'Buckley, a tall well-made raw emeralder, who had never seen a ship before in his life, but had been tempted to enter the service through the promises of a man belonging to the gang.

"Well, my lad," says one of the captains to a respectably dressed young man in deep mourning, and whose face exhibited strong marks of sorrow, occasionally reddened by hectic glows of indignation, "well, my lad, and where did you come from?" "From the grave of a parent," replied the man in a sunken hollow tone. "What profession are you?" inquired the officer. "A seaman," rejoined the man again. "Ha, ha!" cried another captain, as well known for his inhumanity as his aversion to the smell of powder and the whistling of shot, "ha, ha! I see how it is: so you've been cruising ashore, and got pressed, eh, and now want, with that methodistical countenance, to make us believe you're a saint? But it won't do, young man, it won't do. There, you may walk forward: I'll see that you are taken care of, depend upon it." "Stop, stop a minute, my lord," said the third regulating officer, a venerable old gentleman, whose very look displayed the benevolence of his heart. "Come here, my man; how came you in this awkward situation?" The taunts and harshness of the second captain had shed a deadly paleness upon the poor fellow's features; but when the voice of the third sounded on his ears, he felt it thrill to his heart, and the tears started to his eyes. "Ha! how came you in limbo, eh! my friend? Captain —— must hear all about it, and a plausible tale we shall have, no doubt. For my part, I don't see any necessity for being bored with long stories, only to excite compassion; and I hope you will not be long, Captain ——, before you have done with him. Only see the number of wretches we have to examine." "As for exciting compassion, my lord," rejoined the hoary veteran, with a look of contempt, "I am afraid every attempt upon you would be ineffectual." "What!" cried his lordship, starting up in a passion, "what, sir, do you apply that to me?" "Come, come, Lord ——," said the third captain, with the utmost composure, "sit down, sit down: I'm not to be frightened at my time of life by the explosion of a pinch of gunpowder. Fuzzle and smoke have no effect upon me. Attend to your duty now; we can talk of this afterwards.

"There, don't be alarmed, my man," turning to the seaman; "no one shall injure you here while I have power to prevent it. You say you came from

the grave of a parent: explain what you mean." He bowed, and with tremulous agitation began:—"My history, sir, is brief; but 'tis full of anguish." "Prithee, my good fellow, don't get sentimental," said his lordship affectedly, and taking a pinch of snuff: "let's have the history by all means, as it will please Captain ——; but pray leave out the anguish." "Would to heaven I could, sir!" replied the man in a voice which made his lordship start; "then, however high my gratitude might be raised by kindness, my spirit wouldn't be wounded by cruelty and oppression particularly." Here he stopped, for his lordship jumped up, and, raising a speaking-trumpet that lay by, aimed a blow at the seaman's head. During the above conversation it was curious to watch the looks of Michael O'Buckley, who seemed intent upon all that passed, yet apparently without being able to comprehend what it was about. Every now and then he would mutter to himself, "Och hone, och hone!" but when he saw the speaking-trumpet upraised, and the blow about falling, he sprang forward, caught his lordship round the middle, and, lifting him over his head, roared out, "Och, if you spake a word, I'll break every bone in your skin, jewel; d'ye call that fair play, to strike a man in the face behind his back?"

The confusion and astonishment which prevailed on this sudden operation of Mike's it is impossible to describe; while his lordship, pale and trembling, elevated eight feet from the deck, dreaded a total annihilation. "Do spake a word, jewel, and it's down I have you. Arrah, bad luck to your mother's son!" The marines, who were exercising on the poop, now came down, and advanced towards the Irishman. "Arrah, stand back: och, have at your heart, darling! If you advance, I'll spit him on your skewers." "Come, come, my man," said the third captain, "do you know what you are about?" "Indeed, and I do, ould gentleman," replied Mike, "by token"—here he stopped short, with a look expressive of abhorrence and disgust, and setting his lordship down on the deck, he gave him a kick behind, exclaiming, "Get out o' dat, ye devil's skin, do!" Away slunk the crestfallen hero, and Mike was in an instant surrounded and secured.

Order being again restored, Mike quietly submitted himself, and stood among the rest, between two marines with drawn bayonets. "Now, young man," said the venerable old captain (who no doubt enjoyed the frolic), "let me hear what you have to say." "I scarcely know, sir, what to say: no doubt my fate is sealed. My father, sir, was a master in the navy, and I was the only child of a doting mother: both are now at rest for ever. My father lost his life on the 1st of June, in the ——, seventy-four, under Lord Howe; and my poor mother was reduced to comparative poverty. At a proper age I went to sea in the merchant service, and in a few years was made mate. I now experienced happiness; for my surviving parent, with her pension and my wages, was enabled once more to enjoy not only the necessaries, but a few of the luxuries of life. Every prospect was cheerful, and I looked forward with the hope of obtaining a command, until one fatal evening, having landed to pay her a visit, I had just reached the door, when a party of men from the ——"

At this moment a lieutenant, who had come on board for orders, looked him full in the face, and then, turning to the regulating captains, exclaimed, "Gentlemen, this man is a deserter from the —— frigate; his name is George Davis." "'Tis, alas! too true," said George, mournfully, and hanging down his head; when, seeming suddenly to recollect himself, he uttered, with firmness, "No, sir, I'm no deserter, and I shall leave my cause to the generosity and justice of my country; yes, to that country my father died to defend. When I was torn from my mother's door, without even the gloomy satisfaction of bidding her farewell, 'twas against my inclination, and I was forced on board the frigate, which sailed immediately for the West Indies; nor was it till my arrival there that an opportunity occurred for informing her of my situation. After three years' absence we returned, and the first intelligence I heard was that she who gave me being lay at the point of death. I had fondly pictured to myself the pleasure of meeting her in health, and, with the prize-money I had gained, endeavouring to smooth her passage to the tomb. She was dying, and I hastily entreated leave of absence to bid her a final adieu, and perform the last sad offices of a son. 'Twas denied me—I had been pressed, and might run away. In vain I urged, implored, and protested; 'twas, indeed, in vain. Goaded almost to madness, in a desperate moment I went overboard, and swam ashore. At midnight I entered my mother's solitary dwelling, closed her dying eyes, and followed her to the grave. Returning back from this mournful scene, the gang took hold of me, and—and I am here."

This affecting little narrative operated very powerfully upon all who heard it, but more particularly on Mike, who kept mumbling to himself, "Och, d'ye hear that now? Its enough to crack the heart of a stone, agrah!" while every muscle of his face underwent twenty different changes. "You may stand on one side," said the senior regulating captain; "and now bring the prisoner aft.

"Pray, sir, where do you come from?" inquired he, as soon as Mike stood before him. "Is it meself that you mane?" replied Mike. "Why, then, your honour. niver a word of a lie will I tell you: its from dare little Ireland I com'd; for a spalpeen tould me, if I entered, I'd be sure to be made a captain directly, or at laste a left-tenant of sea-dragoons. Bad luck to him! for I suppose there's no captain-ship for me." "Are you aware of what you have committed?" "Och! don't mention it. I'd be proud to do the same any day." The captain smiled. "What is your name?" "Is it me name that you're wanting? fait, den, you'll be troubled to get it: Michael O'Buckley don't tell his name to every body; and sorry the word you'll get from me, jewel." "I don't know what your opinion may be, my man; but I can only tell you that you are in a fair way to be hanged." "Hanged!" said Mike, with the utmost unconcern: "Och, botheration! and I've no call to it, any how; but if your honour's worship says so, why I suppose it's as good as done." Finding they could make nothing of him, poor Mike was sent down to the aft cockpit, to be put in irons. In the heat of his passion, Lord —— would have written for a court-martial; but, knowing there was a something which he did not wish to be publicly exposed, he *contented* himself with witnessing the punishment of poor Mike at the gangway. Four dozen was his portion, which he took without flinching, merely turning round now and then, uttering one of his customary ejaculations.

George Davis, for the same reason, was not tried, and, by the intercession of the humane old captain, was drafted into his own ship, where he continued, universally esteemed, till the attack upon Copenhagen, when he died the death of his father, in the service of his country.—*Greenwich Hospital.*

TEMPERANCE SOCIETIES IN BRITAIN AND AMERICA.

THE objects and system of temperance societies are well understood by most of our readers. Nothing certainly can be more laudable than the wish to eradicate drunkenness, and to sweep off by one operation the whole train of ugly vices of which it is the foster-father. It appears singular, however, that this scheme, benevolent as it seems, has met with a very different reception in this country, and in America. Temperance societies have with us made very little progress; among the body of the wealthier classes they have made none whatever; and though they have secured a point for themselves here and there, among such classes of people as submit to serious guidance, they have exerted nothing like a *general influence* any where. The great majority treat them with ridicule, as the hobby of enthusiasts; and it even requires a little effort of firmness in any of their friends to confess himself in society as under the vows which they impose. He knows that such an acknowledgment is taken as a sign that he has, somehow or other, a small flaw in his judgment; and that, instead of making converts, he has a good chance of being himself winked at all the evening as an odd person, who won't make himself sociable. In America the results have been quite the reverse: the cause of temperance societies has been advocated there in the principal reviews and magazines; it is every where treated with the respect due to a serious and most important question of national morals; and ridicule is the last weapon with which it would be attacked, even by those who oppose it. The principle and vows of temperance societies are discussed, in their bearings on religion—their effects on the character of individuals—and their influence on general morality; but they are never objects of frivolous wit or of satire. The effects of the scheme have corresponded with those dispositions in which it is viewed; from one authority, we learn that "there are now in America 4000 temperance societies, embracing more than 500,000 members; that more than 1500 distilleries have been stopped, and more than 4000 merchants have ceased to trade in spirits. Besides the 500,000 members of societies who abstain from alcoholic liquors, in consequence of their engagement or vow, there is evidence that nearly a million more do so from the influence of example." From another publication we extract the following:—"When the temperance reformation began, there were in this nation (America) not less than from three to four millions of drinkers of ardent spirits; and as not less than one in ten among us who take to this practice become *intemperate*, so we had at this time from three to four hundred thousand drunkards. The plague of intemperance was in all the land; it was fast coming up into all our dwellings; we were becoming emphatically a nation of drunkards. Nothing could stay its progress, until the hitherto undiscovered power of *total abstinence* was brought out against it. And now that power is to be seen in the fact, that not less than one-fourth of the families in the nation have secured themselves, on the principle of total abstinence, against the woes of intemperance. And it is seen, too, in the fact, that, together with a constant reduction in the manufacture of domestic spirits, the importation of foreign distilled liquors into the great emporium of our nation, has fallen off at the rate of one-fifth annually, during the progress of the reformation. A considerable portion of the venders of ardent spirits have abandoned the traffic. Temperance has substituted in *rum-debased families* among the humble and poor, cleanliness, comfort, and peace, for squalor, want, and contention; while it has moderated the extravagance of the fashionable and rich, and simplified their modes of living."

Not one word of all this can be said for the effects of the temperance system in Britain. We question if a *single* trader has withdrawn from the traffic. Not one distillery has stopped, or has diminished its operations; and the importation of foreign spirits is, we believe, increasing, rather than falling off. A few instances of reform may have occurred—some of them steady and permanent, but the most part only temporary. The excitement of a *new thing* gave birth to a number of societies at first; but from indifference, disunion, or ridicule, we believe that more than half of them were speedily dissolved, and the rest which stood, now exercise little influence over their members, and none at all in the way of example over the rest of their countrymen.

To what cause are we to attribute this singular difference of effects in the working of the same laudable system in these two countries? Are we to say that the Americans are a people more susceptible of moral reproof, and of salutary conviction, than we are? or are our habits of drunkenness so confirmed by long habit, that they cannot be removed with the same ease as those of a new country? The real cause, we believe, depends simply on a circumstance in which the manners of the two nations differ from each other. In America, it has never been customary to sit after dinner to enjoy conversation and the bottle. The repast is there finished rapidly; and if wine, spirits, or liquors of any kind, are taken, they are taken quickly during the time of eating, or immediately after, and merely as a part of the meal: no one sits over them either to kill time or enjoy company. Dinner is generally finished in a quarter of an hour. Individuals who are addicted to drinking take their liquor in drams at the bar of a hotel, from a bottle in their own cupboard, or otherwise, but constantly by themselves, or at least without reference to any pleasure arising from drinking in company. All travellers in America, both those who have given favourable and unfavourable reports of the country, are quite unanimous in their statements on this point. The customs in Britain, with respect to drinking, are altogether the reverse of this: it is here viewed as a sort of bond of social enjoyment, and is valued chiefly as it promotes that kind of agreeable excitement which friends like to feel in each other's company. To sit down to a solitary bottle is thought quite odious; and we have seen a sensible and well-bred man express regret for the departure of his guest after dinner on sudden business, for this reason among others, that it prevented himself *from enjoying his tumbler*—he could not think of drinking alone, though he liked it. The habits of the two countries on this matter are therefore completely opposite. In America, drinking was a *solitary vice*; in England, it is a *social enjoyment*. To declare war against it in the United States was only to provoke the hostility of dram-drinkers, solitary bottle-men, and people for whom the sympathies of society could in no shape be enlisted; the men themselves were ashamed to defend their own unsocial indulgences. But in England one may as well attack tea-drinking among parties of women, as toddy or hot punch-drinking among male companies. They are each deemed the enliveners of conversation, and the symbols of social enjoyment. This reason is exceedingly obvious; but there are others almost equally influential in cultivating a taste for inebriation. The first of these is found in the present demoralised, ignorant, and miserable condition of a large portion of the population of Great Britain. There are immense masses of people in this country who are entirely "without hope in the world." They exist in the lowest stages of destitution, and appear as if placed beyond all attempts to improve them. These fall into the habit of dram-drinking in the natural course of things; and finding in it a relief, such as it is, to their misery—finding that it numbs their despair, and gives them a temporary comfort, they become irreclaimable drunkards or tipplers. The second reason that we may offer is discovered to consist in the great national system, as we may call it, of public dinners. If the members of any corporation, of any body of men any political faction, or literary association, wish to ascertain each other's sentiments, or to accomplish any object which a cool discussion or meeting in daylight would fail to bring about, then there must be a dinner—in other words, there must be a scene of drinking and carousing, such as is calculated to undermine the very best resolutions of those inclined to rigid temperance. This practice—which may be good or bad, as people think—extends its influence very widely; it induces those who are liable to go out into company to habituate themselves to "take a little" regularly, lest they should suffer considerably when obliged to attend public festivities. We need not descant upon the injurious tendency of convivial clubs: they might be described as, in most instances, associations to promote intemperance.

Such are some of the prevailing causes why the progress of temperance societies has been so different in the two countries. In America, they were favoured by all, as removing a hateful and unsocial vice; in England and Scotland, they were met with

universal ridicule, as declaring war against one of the comforts of the people—one of the most effectual bonds of good company and social cheerfulness.

It is exceedingly unfortunate that this piece of practical sophistry—for it is no other—should oppose itself to the progress of a most useful reform. The fact, as it appears, singularly illustrates the difficulty of applying the institutions or customs of one country to the circumstances of another. Intemperance requires to be checked in this country as much as in America; but the change, it is evident, cannot be brought about here by the same means. Temperance societies should proceed in their laudable course; those who become members, or who voluntarily abandon a bad habit, or the liability to it, we consider as, in a certain sense, heroes who deserve the thanks of the community. But in the desperate and complicated circumstances in which society is placed, some other great engine of improvement must be brought to bear. Time, or the gradual improvement in manners, will doubtless amend the evil, but in the meantime, the press and the proper authorities, men of ability, and men of exalted station, ought to combine to correct the abuse, and persevere in their efforts to revolutionise a system so destructive to public peace and private virtue.

A CHAPTER FROM IZAAK WALTON.

Taking up that ancient and venerable production, "The Complete Angler," by old Izaak Walton, we find, among other excellent passages, one on the virtue of contentment, in which the garrulous author introduces a poetical piece of so much beauty and correct feeling, that it seems deserving of being resuscitated for the benefit of modern readers.

"Well, scholar, having now taught you to manage your rod, and we having still a mile to Tottenham High Cross, I will, as we walk towards it in the cool shade of this sweet honeysuckle hedge, mention to you some of the thoughts and joys that have possessed my soul since we met together. And these thoughts shall be told you, that you also may join with me in thankfulness for our happiness. And that such may appear to be the greater, and we the more thankful for it, I will beg you to consider with me how many do, even at this very time, lie under the torment of the stone, the gout, and toothach; and this we are free from. Every misery that I miss is a new mercy; and therefore let us be thankful. There have been since we met others that have met disasters of broken limbs; some have been blasted, others thunder-struck; and we have been freed from these, and all those many other miseries that threaten human nature: let us therefore rejoice and be thankful, especially since we are free from the insupportable burden of an accusing tormenting conscience—a misery that none can bear. Let me tell you, there be many that have forty times our estates that would give the greatest part of it to be healthful and cheerful like us, who, with the expense of a little money, have eat, and drank, and laughed, and angled, and sung, and slept securely; and rose next day, and cast away care, and sung, and laughed, and angled again; which are blessings which many rich men cannot purchase with all their money.

It was wisely said by a man of great observation, 'That there be as many miseries beyond riches as on this side of them;' therefore, if we have a competency, may we be content and thankful. Let us not repine, or so much as think, that riches are unequally dealt. Cares are the keys that keep those riches, and they hang so heavily at the rich man's girdle, that they clog him with weary days and restless nights, even when others sleep quietly. Let me tell you, scholar, that Diogenes walked on a day with his friend to see a country fair, where he saw ribbons, and looking-glasses, and nut-crackers, and fiddles, and hobby-horses, and many other gimcracks; and, having observed them, and all the other trifles that make a complete country fair, he said to his friend, 'Lord, how many things are there in this world of which Diogenes hath no need!' And truly it is so, or might be so, with very many who vex and toil themselves to get what they have no need of. Can any man say that he hath not been given enough to make his life happy? No, doubtless; for nature is content with a little. And yet you shall hardly meet with a man that complains not of some want; though he, indeed, wants nothing but his will; it may be, nothing but his will of his poor neighbour, for not worshipping or not flattering him: and thus, when we might be happy and quiet, we create trouble to ourselves. I have heard of a man that was angry with himself because he was no taller; and of a woman that broke her looking-glass because it would not show her face to be as young and handsome as her next neighbour's was. And I knew another who had been given health and plenty, but a wife that nature had made peevish, and her husband's riches had made purse-proud; and must, because she was rich, and for no other virtue, sit in the highest pew in the church; which being denied her, she engaged her husband into a contention for it, and at last into a lawsuit with a dogged neighbour who was as rich as he, and had a wife as peevish and purse-proud as the other; and this lawsuit begot higher oppositions, and actionable words, and more vexations and lawsuits; for you must remember, that both were rich, and must therefore have their wills. Well! this wilful, purse-proud lawsuit lasted during the life of the first husband; after which his wife vexed and chid, and chid and vexed, till she also chid and vexed herself into her grave; and so the wealth of these poor rich people was cursed into a punishment, because they wanted meek and thankful hearts; for those only can make us happy. I knew a man that had health and riches, and several houses, all beautiful and ready furnished; and would often trouble himself and family to be removing from one house to another: and being asked by a friend why he removed so often from one house to another, replied, 'It was to find content in some one of them.' But his friend, knowing his temper, told him, 'If he would find content in any of his houses, he must leave himself behind him; for content will never dwell but in a meek and quiet soul.'

Well, scholar, I have almost tired myself, and, I fear, more than almost tired you. But I now see Tottenham High Cross; and our short walk thither shall put a period to my too long discourse; in which my meaning was, and is, to plant that in your mind with which I labour to possess my own soul—that is, a meek and thankful heart. And to that end I have showed you that riches without them (meekness and thankfulness) do not make any man happy. But let me tell you, that riches with them remove many fears and cares. And, therefore, my advice is, that you endeavour to be honestly rich, or contentedly poor: but be sure that your riches be justly got, or you spoil all. For it is well said by Caussin, 'He that loses his conscience has nothing left that is worth keeping.' Therefore be sure you look to that. And, in the next place, look to your health; and if you have it, value it next to a good conscience; for health is the second blessing that we mortals are capable of; a blessing that money cannot buy; and therefore value it, and be thankful for it. As for money (which may be said to be the third blessing), neglect it not: but note, that there is no necessity of being rich; for I told you, there be as many miseries beyond riches as on this side them: and if you have a competence, enjoy it with a meek, cheerful, thankful heart.

And pray let's now rest ourselves in this sweet shady arbour, which Nature herself has woven with her own fine finger; it is such a contexture of woodbines, sweetbriar, jessamine, and myrtle, and so interwoven, as will secure us both from the sun's violent heat, and from the approaching shower. And being sat down, I will requite a part of your courtesies with a good copy of verses, being a farewell to the vanities of the world, and some say written by Sir Harry Wotton, who I told you was an excellent angler. But let them be writ by whom they will, he that writ them had a brave soul, and must needs be possessed with happy thoughts at the time of their composure.

"Farewell, ye gilded follies, pleasing troubles!
Farewell, ye honour'd rags, ye glorious bubbles!
Fame's but a hollow echo—gold, pure clay—
Honour, the darling but of one short day—
Beauty, th' eye's idol, but a damask'd skin—
State, but a golden prison, to live in,
And torture freeborn minds—embroider'd trains,
Merely but pageants for proud swelling veins—
And blood allied to greatness is alone
Inherited, not purchased, nor our own.
Fame, honour, beauty, state, train, blood, and birth,
Are but the fading blossoms of the earth.

I would be great, but that the sun doth still
Level his rays against the rising hill—
I would be high, but see the proudest oak
Most subject to the rending thunder-stroke—
I would be rich, but see men, too unkind,
Dig in the bowels of the richest mind—
I would be wise, but that I often see
The fox suspected, whilst the ass goes free—
I would be fair, but see the fair and proud,
Like the bright sun, oft setting in a cloud—
I would be poor, but know the humble grass
Still trampled on by each unworthy ass—
Rich, hated—wise, suspected—scorn'd, if poor—
Great, fear'd—fair, tempted—high, still envied more:
I have wish'd all; but now I wish for neither,
Great, high, rich, wise, nor fair—poor I'll be rather.

Would the world now adopt me for her heir—
Would beauty's queen entitle me the fair—
Fame speak me fortune's minion—could I vie
Riches with India—with a speaking eye
Command bare heads, bow'd knees, strike justice dumb,
As well as blind and blame, or give a tongue
To stones by epitaphs—be called 'great master,
In the loose rhymes of every poetaster—
Could I be more than any man that lives,
Great, fair, rich, wise, all in superlatives—
Yet I more freely would these gifts resign,
Than ever Fortune would have made them mine,
And hold one minute of this holy leisure
Beyond the riches of this empty pleasure!

Welcome, pure thoughts! welcome, ye silent groves!
These guests, these courts, my soul most dearly loves!
Now, the wing'd people of the sky shall sing
My cheerful anthems to the gladsome spring:
In Nature's book I'll find my looking-glass,
In which I will adore sweet virtue's face.
Here dwell no hateful looks, no palace cares,
No broken vows dwell here, nor pale-faced fears;
Then here I'll sit, and sigh my hot love's folly,
And learn t' affect a holy melancholy:
And if contentment be a stranger, then,
I'll ne'er look for it, but in heaven again."

THE WESTERN STATES OF AMERICA.

INDIANA.

The next state that properly comes under observation, is that of Indiana, which lies immediately west from the state of Ohio, and, like it, has the Ohio river for its southern boundary. On the north it has the Michigan territory and the lake of the same name; and on the west the state of Illinois. The length of this state is 250 miles; its breadth 150; and it lies between the 37th and 50th degrees of north latitude; wherefore its climate is generally of a medium temperature. The whole of this state belongs to the valley of the Ohio, or lake Michigan, and is for the greater proportion covered with timber, and adapted for settlement. Indiana is one of the more recently-established states of the Union, and has attracted somewhat less attention than other states adjacent; nevertheless, the settlement of immigrants within its boundaries has gone on gradually, and is still increasing: its population now amounts to about 400,000.

The south front of this fine state, on the borders of the Ohio river, is skirted with the usual belt of river hills, bluffs, and knobs, occupying a greater or less distance from the river. The eye of the traveller, in ascending the stream, never tires in surveying those beautiful bluffs, especially in the spring, when their declivities are crimsoned with the red bud, or whitened with the brilliant blossoms of the dog-wood, or rendered verdant with the beautiful May apple. There are in different parts of the state large tracts of country of a hilly nature, but the greater proportion of the land is one vast level, the prairies being here, as elsewhere, of that flat character. For a wide extent on the north front of the state, between the Wabash and lake Michigan, the country is generally an extended plain, alternately prairie and timbered land, with a great proportion of swampy land, and small lakes and ponds. This division, therefore, is not to be preferred by settlers. But the prairie lands are highly spoken of. They are large, level, fertile plains, broader than can be measured by the eye, intersected by streams whose borders are marked by belts of timber. Every traveller has spoken with admiration of the beauty and fertility of the prairies along the course of the Wabash, particularly those in the vicinity of Fort Harrison; indeed, competent judges prefer the prairies on this part of the river, to those of Illinois and the Upper Mississippi. Perhaps no part of the western world can show greater extents of rich land in one body, than that portion of White River country, of which Indianopolis is the centre. A remarkable peculiarity in the great features of this state, is the variety of the prairies. Besides the large plains just mentioned, there are many of a long and narrow, and also of a small and compact form, available to the purposes of the agriculturist. Our authority, Timothy Flint, informs us that there are hundreds of prairies only large enough for a few farms; while the islands, as he calls them, of timbered lands, dot the scene, and add much beauty to the territory. The mixture of great and small extents of fertile land, and the happy distribution of springs and rivers, have been prevailing causes of the rapid increase of the population of the state; though the circumstance of its being a non-slave-holding state, and next in position beyond Ohio, so as to have arrested the tide of emigration that set towards the west from thence, may likewise be given as good reasonr for its speedy rise into importance.

This state generally produces Indian corn, rye, oats, barley, and wheat, in abundance. Such is the exuberant richness of some of the prairies and bottoms, that they cannot produce crops of wheat until reduced or impoverished to a sufficient extent by cropping in other products. No country can exceed this in its adaptation for rearing the finest fruits and fruit-bearing shrubs. Wild berries in many places are abundant; and on some of the prairies the strawberries are large and fine. For all the objects of farming, and raising grain, flax, hemp, tobacco, cattle, sheep, swine, and horses, emigrants could not desire a better country than may be found in Indiana.

The southern shore of this state is washed by the Ohio, from the mouth of the Big Miami to that of the Wabash, a distance of nearly 500 miles, by the meanders of the river. Between the Miami and the Wabash a number of lesser streams fall into the Ohio, many of which afford excellent mill-seats. The Wabash is the chief river of this state; and, after the Tennessee, one of the most considerable tributaries of the Ohio. Rising in different branches, and flowing in a body through the central parts of the state, it waters a wide extent of country, and is of great service for other purposes. White River is the most considerable tributary of the Wabash, which it enters on the eastern side, sixteen miles below Vincennes. It waters a large extent of fertile country, in a lateral direction to the main stream. On all these rivers and most of their branches there is ample scope for the settlement of emigrants. The northern front of the state, bordering on Michigan and its lake, is likewise copiously watered by rivers that empty into lakes Michigan and Erie. Many of the rivers of the state are navigable by boats and steam-vessels; as yet there are few artificial canals; but altogether, the state is said to possess an inland navigation of not less extent than 5000 miles.

Indiana contains a number of thriving towns and villages, chiefly situated on the banks of the Ohio, the Wabash, White River, and other large streams. Madison, Jeffersonville, Vincennes, Richmond, and Indianopolis, are the principal. Madison, the most populous, and one of the most thriving towns in the state, is situated on the Ohio, nearly at an equal distance between Louisville and Cincinnati. Vincennes, a town of French origin, is seated on the Wabash, a hundred and fifty miles from its mouth, and is one of the most beautifully situated and pleasing towns in this part of the United States. New Harmony, a place at which Mr Robert Owen of New Lanark, in Scotland, endeavoured to establish his social system, is also situated on the Wabash, in Indiana, fifty-four miles below Vincennes. This part of western America was visited by Mr Stuart in the course of his travels; and he remarks, that, besides possessing many good settlements, it has much beautiful rich land, fit for the selection of emigrants. While at Princeton, a town or village situated in an elevated fine waving country, about ten miles from the Wabash, and where there are many nice-looking plantations, he visited a gentleman, whose story may be advantageously alluded to. "After breakfast," says he, "I paid a visit to Mr Phillips, who has a very fine plantation, the best in the neighbourhood, about a mile from the town. Mr Phillips is an Englishman, and was contractor for the mail-coach establishment in Edinburgh, in Scotland, where he made a fortune. His farm is of excellent soil, beautifully situated, commanding a delightful view. He told me that, literally, his hogs were fed with peaches and apples. In short, he is living as the proprietor of a place, so comfortable in appearance in all respects, and so much improved in the British sense of the term, that, if it were in Scotland, it would be envied by many; but he is obviously not altogether satisfied with his situation on some accounts, which I may explain. First of all, he has committed an error into which British emigrants, who come out here with their pockets full of money, very generally fall—namely, that of laying out a large sum of money in improving and beautifying the land in a British style. Such improvements yield no adequate return in this country, even upon a sale. The price of labour is high in this country; the value of produce is low. I am not, therefore, at all surprised that Mr Phillips feels chagrined on account of his having laid out his money unprofitably; but he is wealthy, and this circumstance is obviously not that which annoys him most. His complaint is, that he has not a gentleman in his neighbourhood to associate with." Mr Stuart now proceeds to show that those who, like Mr Phillips, move in the better circles of society at home, and who are in perfectly comfortable circumstances, should not, on any account, emigrate to America with the view of placing themselves in an improved condition of life; and then continues: "Mr Phillips is proprietor of a fine estate, which would be thought a desirable one in any part of the world; but he does not feel at home with the people, and he dislikes their mode of life, which is totally different from that to which he has become attached. He misses his frequent chats with his neighbours, and the companions of the first part of his life; and he cares little about the enjoyments, of which he is possessed in this country, unless he can share them with his friends. This is all very natural; but had Mr Phillips come to this country at the age of thirty, or thirty-five, with manners not so entirely formed as they seem to have been, without prejudices—with some such sum as L.700 or L.800, and with a wife and a family of half a dozen children, for whose support that sum would have availed but little at home, he might have obtained a plantation here, from the produce of which, if managed discreetly and without unnecessary expense, he not only could have maintained his family well and respectably, and given his children excellent education, but have at once come into possession of every political privilege; in fact, have become a country gentleman. The situation and status of such a family coming to this country are entirely altered. Their prospect at home is gloomy and dark: here, with industry, it is bright and serene. It is for persons of this description (no matter though they have a little more money, but they must not be rich nor independent), and for mechanics and labourers, that the United States hold out inducements for emigrants not to be found elsewhere; but the rich, the luxurious, the man of letters, or of refined habits, should never, in existing circumstances, think of crossing the Atlantic, with a view to better himself by a permanent residence in the United States. Mr Phillips noticed to me before I left him, the want of well-educated medical men in the western parts of America. This I had before observed; and I am convinced there are many very eligible openings in the western states, and especially in the states of Missouri and Illinois, for medical gentlemen of skill. They should get a small plantation in one of the increasing towns, and, if capable of enduring fatigue, there is no doubt of their success."

The poor man who emigrates to this, as well as other states in the west, will find that maize or Indian corn will be his chief crop. If industrious, and with one horse, he will cultivate twenty acres in a season; the product of which may be estimated on an average at one thousand bushels. The cultivation and harvesting of this crop, after deducting bad weather, and other hinderances, will occupy about four months. One shilling per bushel, New England currency, is a common price after being cut and stored. Indian corn is the staple food for horses and cattle through the winter, for fattening swine, and is the sole article for bread in thousands of families; many preferring it to the finest wheat. A poor man, with a cabin and cornfield, may thus easily support a family in wholesome provisions; especially if he have two or three cows, and some hogs, which cost little or nothing for keeping, and furnish a relishing dish of bacon to the ordinary fare of the back woods.

EFFECTS OF TRADES ON HEALTH.

[By Thackrah.]

Having now adverted to the principal occupations which affect health by the noxious substances which they offer to respiration, we next refer (says Mr Thackrah, in his excellent little work on the effects of trades on health) to those which *injure or annoy by acting on the skin.*

Potters suffer from the lead used in "glazing." Immersing their hands in a strong solution of this mineral, they are often attacked by colic; and if kept in this department, they at length become paralytic. Potters are remarkably subject to constipation of the bowels. Of seven individuals taken indifferently, we found five affected with this complaint. The intemperate men, however, are those who chiefly suffer from the employ. In the Leeds pottery we remarked nothing injurious but the department of glazing.

Could not the process be effected without the immersion of the hands in the metallic solution? Or could it not be effected by a machine? Or could not some article less noxious be substituted for the lead? On visiting the Derby pottery, some years ago, I learnt that little lead is used in the composition for glazing, and that the workmen consequently are not injured.

The total disuse of lead in glaze is highly desirable. Independently of the injury sustained by the workmen, the consumers of the article may suffer from this mineral. The glaze of common earthenware is slightly soluble in animal oil, and more copiously in the acids of our common fruits, especially when their action is assisted by the heat necessary for cooking these articles. Many of the obscure visceral diseases of the poorer classes are greatly to be attributed to this little suspected source; and the temporary removal of the pain occasioned by them, is one of the many motives which tend to the habitual use of distilled spirits.

Hatters have their hands frequently immersed in a solution of sulphuric acid, which is employed in the process of 'felting;' and hence their nails and the cuticle (outer skin) of their fingers are often corroded and sore. This inconvenience might perhaps be prevented by the use of some oily substance.

Grocers, having their hands frequently in sugar, become affected often with a cutaneous eruption—a variety of either impetigo or eczema. Lime produces a similar disease on the hands of Bricklayers. Flour irritates the skin of Bakers, and occasions a scale—a variety of psoriasis (itch).

Chimney-sweepers necessarily suffer from the soot with which they are covered. The skin assumes frequently a malignant disease—Cancer scroti. Ophthalmia is produced by the irritation of soot in the eyes: and the lungs suffer from the substance drawn into the air-tube. From this injury to the lungs, children, however, seem to be comparatively exempt. Though daily inhaling a large quantity of charcoal, sulphur, and ammonia, they frequently remain for some years free from urgent disorder; like the children in the flax-mills, who inhale dust for a considerable period with apparent impunity. But as these ultimately suffer, so also the wretched inspirers of soot become at length seriously diseased.

The evils of the employ are doubled by intemperance. The sweeps who travel through the country are especially drunken; and lads acquire a craving for liquor from their habit of receiving beer at every house they serve. Many chimney-sweeps die in youth; few live to the age of fifty. Surely this shocking and unnatural occupation ought to be abolished!

There are other trades in which the surface of the body is affected, though in a less degree, by the peculiar substances applied: but without entering into further detail, I would urge the necessary effect of almost all the occupations of a manufacturing town in fouling the skin. When we consider the functions which this organ is known to perform, independently of those which physiology suspects, but has not ascertained, when we refer to the natural products of the skin, insensible perspiration, sweat, unctuous matter, &c., we wonder how men can endure the compound crust of soot, dirt, and secretions, with which they are enveloped. Throughout the whole of the labouring classes, and indeed among the majority of the middling and upper, this subject is strangely neglected. Cleanliness is practised in a very imperfect manner; the whole surface is seldom washed; and in most persons the body, with the exceptions of the hands and face, is cleaned only by the removal of those impurities which adhere to the linen. Bathing is rarely used in any form. On inquiry at the Leeds baths, I learn that during the four summer months about fifty persons bathe daily; and in other parts of the year, not more on the average than two or three. We may conclude, as these are often the same individuals, that not more than 200 or 300 of the inhabitants of Leeds frequent the establishment; and if we supposed that double the number plunge in the river, we cannot estimate the persons who bathe, even in the summer months, at more than 800 or 900; and this of course is a very small proportion of our crowded population.

Vain, at present, would be the attempt to revive the discipline of the ancient bath, or to import the practice of the East. We cannot join the Hindoo or Mussulman in connecting the idea of internal sanctity with external purification. We are equally indifferent to the advantages which the Greek and Roman derived from the system, in the augmentation of muscular power, the increase of bodily and mental comfort, and the diminution of the calls of hunger. We can scarcely spare time for a plunge into the water, much less for operose and varied bathing, friction, and inunction.

A part, however, of the ancient practice, we find adopted without design in the manufacture of wool. This article is so moistened with oil, that the exposed skin of the workmen is always greasy. The effect, if we can speak of it separately from other circumstances which act on the health, is decidedly good. The men, the young women, and children in this employ, are more robust than other artizans; and when the dye and dirt are removed from the skin, have really the complexion of health. Individuals too, and especially children, who have been injured by the dust of other kinds of manufacture, and hence have been obliged to leave such employ, become hale and vigorous on their removal to the woollen. I would not, however, be understood to attribute the improvement solely, or even chiefly, to the application of oil to the *skin*. This article has a more important effect in preventing the formation of dust. Yet still, when we compare the state and appearance of workmen in other manufactures, where the dust is trifling, and other circumstances nearly equal—if we compare these men with the plump and rosy slubbers, we cannot but ascribe a beneficial agency to the oily state of the skin. The subject is of practical importance."

JOURNAL OF A TRANSATLANTIC VOYAGE.

[The subjoined article has been sent to us by a gentleman who recently left this country in order to undertake the duties of a station of high responsibility in the island of Jamaica. It was written as an expression of his current sentiments and sensations during the voyage, and sent to one of the editors of the Journal, rather as a communication of private friendship than as a composition qualified to engage public attention. He, however, to whom it was addressed, has felt his own mind so much interested in the descriptions of his friend, that, in the hope of its entertaining a larger circle, he has thought proper thus to lay it before the public. There are few situations or adventures out of the usual routine of domestic life, especially if the scene be beyond the limits of our own country, of which an unaffected narration might not afford pleasure to the public; and a voyage to the West Indies is not an exception from the number. We even recollect a volume devoted to this purpose alone, and in which every particular object that came in sight during the voyage, from the appearance of an island to the portrait of a flying-fish, was represented on an economical scale in accompanying engravings. It is necessary further to premise, that the writer of the present article is a man of almost Quixotic benevolence, and extraordinary purity and gentleness of character, which will at once account for and give point to a considerable number of his observations.]

Wednesday, July 17, 1833. I have been reading to-day, but made little progress. Either the sea-air, or want of usual exercise, induces a feverish and uncomfortable state. We got on by tacking betwixt the English and Irish coasts. At one point we saw the land on either side. I wish to be quit of the sight of English ground. It vexes me; and, for comfort's sake, I must think of other subjects than home. I never before understood so well the highest feelings of patriotism, or could say so emphatically of my country, "With all thy faults I love thee still." What must be the delight of *returning*.

23. I have been ill since the 17th with *sea-sickness*, and scarcely recollect, in all my lifetime, of spending so long a time so miserably. Body and mind suffered together, acting and reacting, aggravated by the poverty of ship-accommodation, the noise, the smallness of my birth, the confined air and smell, the badness of my bedding, the weakness from want of sleep and restlessness, and the *ceasless rolling* of the vessel. How different from a sickness at home: no noises *there*, no rolling—soft beds, and kind, watchful, and constant attendants. I thought all sorts of evil of my situation—that I had transplanted myself from an earthly paradise in Britain to a *terra incognita* of undefined wretchedness. These have indeed been heavy days. But this morning I got up without assistance, which I had been unable to do for some time. I tried a variety of palliatives for the sickness, but am sorry to record that I found nothing worth calling a *specific*. Reading, if one can at all compose the mind to it, is perhaps the best, or a cheerful friend, if so fortunate as to have one. To one leaving his native land in circumstances less happy than mine, the ordeal of seasickness must be ill to bear, especially when backed, as I believe it usually must be, by the *home-sickness*; only he may comfort himself during its progress by knowing that his usual buoyancy of thought will return so soon as it is over, it producing for the time a sort of hallucination.

24. I think I may now pronounce myself quite well, though not yet able to take food as formerly.

29. Nothing worth notice has been occurring. We have now been out thirteen days. This morning, the mate announced that he had seen a flying-fish, and

the captain afterwards saw two, so that we appear to have entered the territory of tropical wonders. Hitherto I have seen little or nothing to gratify my love of the marvellous. Life on ship-board is monotonous and uncomfortable. Want of exercise is peculiarly felt; and there is the constant effort to take it *per se* for duty's sake.

The sunsets are beautiful. I am not sure whether a fine rose-pink colour, blending betwixt and with the yellow and blue, is common in British skies. Last night, another passenger and I went on deck together to look about. Setting ourselves down upon the prow, our gallant process through the deep was noble. I entertained myself with fancying it a transference to the scenery of another sphere, the change from home was so striking. All quiet save the splashing of the sea. Looking up, the full sails bulged out, one above another, like the successive stories or battlements of a tour, with which we were moving through the vast field of waters, the moon presiding over all in placid beauty. I thought of home; and that some there might be then holding me in remembrance before God. * * * *

Friday, August 2. I saw the flying-fish to-day: their appearance, at a little distance, is that of small white birds. The difference of climate is sensible, but more in softness and uniformity than in the heat, which ranges from about 70° to 78° of Fahrenheit.

7. We have hitherto been steering chiefly southwards, to enable us to get the trade-wind, which at this season blows from the east, under the parallel of about 28° north latitude. We are now going westward under a fine breeze, which is likely to continue with us; but calms are often experienced under the parallel of the trade-winds.

We are now crossing, or about to cross the line—not the equinoctial, but the tropic of Cancer. The temperature, notwithstanding, is very pleasant: the thermometer about 77°, with a fine strong breeze. When sitting after tea in the cabin, we heard a great noise immediately above, of stamping with feet, &c., which was followed by the glare of a light passing the window. This, it seems, was an intimation from Neptune that he was to pay us a visit to-morrow. On getting upon deck, I found all quiet, but saw a light floating astern, which continued to burn, rough as the sea was, until it was half a mile distant from the ship. There is a good deal of gravity affected on the subject with us noviciates. "I saw his boat," said the mate, "with himself and his wife and child in it," &c. I have little taste for the nonsense, and don't know well how to take it. I believe they will let me off easily; but there is a poor lad, a steerage passenger, and a Prussian sailor, who can scarcely speak the language, neither of whom, I fear, will fare so well. * * * *

8. I have felt very poorly all day. Low diet, exercise, and a little medicine, are the cures at sea. Exercise is often an effort, especially when (on account of work going on) we are limited to the quarter-deck, which can be gone over in five or six paces. I do what I can, by jumping and dancing, to remedy the deficiency; but these scarcely help me, as I am sole actor. A good Scots reel would really be useful, and would afford an unanswerable illustration of *one* legitimate use of dancing. We had a play at hats and ball, but lost so many balls overboard that we had to stop. It afforded such capital exercise, that I would be disposed to lay in two or three dozen halfpenny balls as part of my sea store should I embark again.

A little before sunset we heard a noise on deck repeated from station to station with considerable dramatic effect. Amidst a multitude of words I could only distinguish the surname of the captain. In a short time a heavy foot was heard on the cabin stair, and down came two figures, Neptune and his wife, in habiliments not unlike those of beings who slept amongst weeds at the bottom of the sea. A palaver ensued betwixt the pair and the captain, consisting of a few common-place inquiries about what ships had been in these parts, the health of the goddess, &c., which ended in his ordering each a glass of rum. They then left us, to send the constables to bring the noviciates severally before him. These officers appeared with blackened faces, and otherwise worthily equipped, and, binding my eyes with a black napkin, they led me away, and seated me on a chair in Neptune's presence. After a few introductory remarks, that he was glad to see me, &c., he ordered the *shaving*, when immediately I heard the noise of stropping the razor, from which I judged it was no very delicate instrument. I was, however, saved from the application of the lather, and the barber contented himself with passing the instrument (*i. e.* an old rusty cutlass) over my face. The bandage was then removed, when I found myself before the throne of the sea god; which was the windlass, on which were seated the two personages in inglorious state.

Lastly, came the poor Prussian, who, as one of themselves, was doomed to an ordeal of extra severity. He was brought in, like the others, blindfolded, &c. Their first act was to put a bottle to his mouth, and force as much of its contents as they could down his throat. The stuff appeared like filthy bilge-water, or something still more filthy; but, on being questioned, he replied that it was "good," fearing, I suppose, the consequences of complaint. They then lathered his face with thin tar; and, during the operation, asking him a number of questions, they stuffed the tarry brush into his mouth every time he opened it. The shaving or scraping, and buckets of water in great abundance, followed, after which he was set at liberty: he had a terrible dose, but took it all with invincible good humour. The conclusion of the affair being to be a laving with water of those present—at least of us—we ran to the cabin. The captain then ordered all a glass of grog, and matters were restored. It is altogether a contemptible ceremony, though amongst witty people it might go off smartly; and it has occurred, I believe, that an action of damages was raised by an incensed passenger against a captain who had allowed it. I incline, from observation, to think that *now* no captain would allow any passenger to be touched by Neptune or his constables, if he seriously and decidedly objected to it.

Two flying-fish dropped on board. They are becoming very numerous. Our only chance of catching them is when they fall within the ship, poor silly animals! They form the proper bait for the dolphin. One of them is to be used for that purpose, and I shall probably dry the other as a curiosity.

21. This day has been distinguished by the capture of a shark. Labouring under the lassitude of a hot climate, the occurrence was not unwelcome, though on the whole it has annoyed and disgusted me. I was sitting on deck after dinner, when a poor fowl which had died being thrown overboard, a shark was seen immediately to rise to the surface and examine it, but allowed it to float away, not liking, I suppose, its feathery covering. Our captain immediately got the shark-hook out, an instrument of iron of the thickness of a little finger, and nine or ten inches long, attached to a small piece of chain and a line of rope, which he baited with a large piece of pork. There was no attempt to conceal the hook: sharks are not nice: and it was immediately thrown out astern. The poor fish immediately advanced; and, turning itself on its back (in consequence of the position of the jaws), caught the bait. The captain pulled; but the hook did not fix; and the pork was therefore got without payment of the penalty. A fresh bait was immediately put on, which succeeded, the shark being no way daunted by the previous operation, which must, I think, have hurt him. So soon as our fisher found he had it fairly hooked, he needed the aid of several of the sailors to pull it in, though in length it did not appear above five feet. It did not struggle much in the water, nor whilst being dragged out and over the ship's side, with all its weight on its jaw, by which it hung. When on deck, and recovered from its surprise, it beat about tremendously with its tail, one stroke of which might have broken a man's leg. One began beating its head with a handspoke, which, instead of proving a mercy, was a needless aggravation of its suffering, as indeed must be every thing but the most decided measures to an animal so tenacious of life. The carpenter was ordered to cut off its tail, to prevent mischief. We accordingly attempted it when quiet, by a stroke with a chisel and mallet, which only cut it to the bone. An axe should have been used. The wretched animal, however, seemed to experience the most excruciating agony, expressed by intense writhings, and violent and rapid striking all about it. The axe was immediately applied, and at one stroke completed the operation. How it would have shrieked had it not been dumb; what looks of agony and upbraiding would it have given us, had its features not been denied the power of expression! I was disgusted and horror-struck, and entreated they would put it out of pain by striking off its head. They did not seem disposed to indulge me, and I therefore withdrew. On seeing this, one took up the axe and gave it several strokes, so as to divide at least the spine, which I thought would have sufficed; but, alas! the life still burned vigorously, and my humanity appeared only to have made matters worse. The creature appearing much weakened, they proceeded to disembowel it. Poor thing! death still refused to come; and, the horrible process completed, it lived still! What was to be done? They cut the head wholly off; but, marvellous to relate, the dismembered, disembowelled trunk was still able to writhe in the hands of its butcher. It was a horrible sight, and, I am sorry to say, appeared pleasantly to entertain rather than grieve most of the on-lookers. I trust, however, that these last contortions may have been merely nervous, and not indicative of pain. Part of it was laid aside to be eaten; the carpenter cut off the fins to use as polishers of wood; one of the men secured the jaws, probably as a present for his sweetheart; and the balance, excepting the head, which I retained for examination, was thrown overboard.

Sailors appear to have a monstrous antipathy to sharks. I tried to convince them of its unreasonableness, but I fear without success. These fish have surely as good a right to live as any other of God's creatures, and to enjoy themselves too: subject to man's dominion only, in case he should need them, to supply him with necessaries or comforts. Did it enter on his domains like a wild beast, he might slaughter it in self-defence; but to do so to an unconscious unoffending animal, in mere wantonness or hatred, merely because it obeys the dictates of its nature, must surely be unwarrantable cruelty.

29. The tendency to sleep during the day is very distressing. I attribute it much to our total want of vegetable food, and suitable refreshments. Porter, ale, and wines, are poor comforts in such a climate; they may please those who are satisfied to take excitement, at whatever cost of after suffering or heaviness; but to others they are, and in such circumstances should be, regarded as mockeries. We have all been so anxious for acids, that we have emptied a large pot of cream of tartar from the medicine chest. A little package of that simple medicine would in all cases, I think, prove extremely valuable to voyagers, as an antidote to the ailments and discomforts incident to landsmen at sea.

OUR SCHOOL-DAYS.

We all love to think and speak of our school-days. Wearied with the dull, monotonous realities of the present, and suspicious of the flattering promises of the future, we turn with calm satisfaction and delighted confidence to the past. The path of life is all uphill; and it is a pleasant thing to pause on our journey, and look back from the point of vantage which we have gained in the progress of years, upon the road that we have travelled;—to survey its sinuous mazes—its perplexing intricacies—its dreary wastes, which we have so happily overpassed—its smiling Edens, which we can thus revisit and re-enjoy. And the remoter parts of that landscape are always most transcendantly lovely in our eyes. A more beautiful heaven seems to overhang them—a softer and more melting sunshine to brood upon them. The trees are greener, and more richly umbrageous. The flowers (for memory's far-seeing eye can distinguish even the celandines, and daisies, and forget-me-nots, at the distance of forty years) the flowers are more gaily apparelled, and more tastefully grouped, and there are far more of them. Over hill and valley, wood and waterfall, meadow and moorland, there are flung "a glory and a joy," which have passed away, like summer mists, from the nearer landscape.

"Heaven is about us in our infancy;" and throughout all our early days we are surrounded by influences, and pervaded by emotions, which in more mature life we *may* remember, but *cannot* recall. When once we have ceased to be children, we have lost the power to think and feel "as only childhood can." We have become sophisticated—cold-hearted—suspicious. We are too wise—too cautious—too incredulous. We will not submit to be cheated into enjoyment, and take the benefit of a happy error. "The world is too much with us"—the solid, substantial, matter-of-fact world, in which grown-up men and women slave at the dolorous drudgery of money-getting. And our senses, and faculties, and susceptibilities, have suffered injury from the tainted atmosphere in which we live. Where are now the marvels and glories which met our earnest gaze every where, in heaven and earth, when we were six, or eight, or ten years old? We search for them in vain. There is a film upon our eyes. We are short-sighted, beyond the power of surgery or optics to cure us. And the sounds which then rung in our ears, awaking the sense of divinest melody in our souls, and wrapping us in thrilling trance from morn to night—where be they? The songs of birds—the hum of bees—the flute-notes of summer winds—the soothing murmurs of running brooks—the mysterious whispers of autumnal woods—are they all silent? Not one is mute; but, alas! they fall upon deaf ears. Nature still "pipes to us, but we will not dance." We can never recover what we have lost, or be again assimilated to our former selves. We can only *remember* what was then *experienced*. The "formal man" can realise the careless joyance and light-heartedness of days which are long since past, in no other way than by contemplating in memory's magic glass, what, and in what manner, and with what emotions, he saw, and heard, and spake, and acted, "when that he was a tiny boy."

Hence we all love to think and speak of our childhood and early youth; and especially of our school days, because they are, for the most part, the commencement of our juvenile reminiscences—we can go no farther back—and because, in all cases, it is from that period that our recollections become distinct in their particulars, and interesting in their associations.

We can remember many grave lectures of parents and pedagogues, to the effect that school-days are the happiest part of a man's life, and that we should find them so. *Then*, we did not believe a word of it. The thing appeared to us a plain contradiction. Long lessons and short play-hours—dreary pages of geography and English grammar, and *Propria quæ maribus*—with all the fears and anxieties, the pains and penalties of our pupilage, were in our estimation any thing but elements of happiness, or incentives to enjoyment. And besides, "Hope told a flattering tale;" and we looked forward to the time when we should leave school, and be our own master—with no dry tasks to learn, and no tiresome bounds to keep, and no frowns or flagellation to fear, as our jubilee—the period of complete emancipation from all trouble and annoyance, when we should pass at once into a state of perfect, uninterrupted, and interminable bliss. Alas! we have seen "Hope's summer visions die." We have been in the school of experience, and disappointment has taught us many a sad and sobering lesson. We have *cut* Campbell for Rogers. We have read through "The Pleasures of Hope," and have got some pages into "The Pleasures of Memory." And now (is it not your experience, gentle reader, as well as ours?) even the little sorrows of our early days are dwelt upon

with feelings near akin to pleasure. That ancient schoolhouse (we thought it a very dungeon once), what a pleasant place it looks! And of what gentle restraints, and easy labour, and innocent mirth, was it the scene! And its presiding genius, with the awful spectacles, and the still more awful "rod for the fool's back," whom we once regarded as an apt prototype of all the ogres and giants in our delightful story-books—what a kind, good old man he was! How much "more sinned against than sinning!" With what loud and hearty praises did he reward our smallest merits! With what surpassing patience did he endure our intolerable and endless provocations! Peace to his gentle shade!

How pleasant it is to send our fancy on pilgrimage to all our school-day haunts!—the walk across the meadows, and down by the brook-side, and over the crazy bridge by the mill, and back again through the shady lane where we gathered sweet violets:—the vicar's copse, where blackberries were as plenty as pebble-stones, and the hazel wood, to which once a-year we went a-nutting:—and above all, the old play-ground, with its smooth turf, and weeping birches (bless the tender-hearted trees for their sympathy!) which would have been a jewel of a place for all our games, if it had only been out of bounds! Oh, those merry games! the boisterous sports of our short play-hours; the riotous rambles and madcap frolics, and innocent mischiefs of our long half-holidays; the

"Quips, and cranks, and wanton wiles,"

which made us every day, and every hour, at once a plague and a delight to each other, and to all about us! And who were our companions in those glorious romps and rambles? The whole group is before us. Of all "the old familiar faces," not one is absent, and not one is changed. We can see them all as clearly—we can distinguish them all as accurately, as we did so many years ago, when we were one of them. There they are, from the oldest to the youngest; from the clever little rogue who taught us how to make whistles, and to fish for minnows, and who so often made us an April fool, to the grave, melancholy boy who never once fought a battle, nor joined in a romp, nor went a-bird-nesting, but told us such marvellous and touching tales, in such eloquent words, as "often did beguile us of our tears." There they are! We could name them one by one, without a single mistake. We could arrange them in their old classes, and seat them in their old desks. We could describe, with most exact minuteness, the qualities, bodily, intellectual, and moral, of every one of them. And if we wrote ourselves R.A., we could paint their pictures to the life. Not one feature would be erroneously sketched; not one shade of expression would be imperfectly brought out. Each would possess its proper individuality of character, and be a speaking likeness. So clearly and distinctly are they present to our inward eye. And hark! the air is vocal with their glee. Their merry voices ring in our ears. We can recognise every tone; we know to whom every shout belongs. Again we listen to "their gibes, their songs, their flashes of merriment," and again we hear our old nicknames and by-words, none of them unkindly meant or harshly spoken, but flowing from a frank familiarity and an innocent openheartedness, which knew nothing of formal propriety and forced politesse. Beloved companions! years have passed since we parted; but ye are our companions still. Ye have gone each to his appointed portion and station—some of you are already dead and in Heaven. Some of you are living in credit, wealth, and fame: and some in poverty, sorrow, and disgrace. We know not what or where you are—in what circumstances—of what character: certain it is, that neither in body nor soul are ye the same as in former days. But no matter. *We* know you only as a troop of joyous children, who studied and sported—who read and romped—who laughed and wept with us when we too were a child. As such, ye abide in our memory, and in our "heart of hearts," unchanged and unchangeable. And your simple society affords a precious solace and happy retreat to our troubled spirits, when we are weary of the heartless formalities and insincere professions of the world.

For your sakes, then, we shall always love to think of our school-days, and, as far as retrospective fancy may enable us, to live them over again. And though the gay and thoughtless may eschew such musings as fantastic and melancholy, and though they must ever be attended with somewhat of pensive sadness and tender regret, yet will we often indulge them, and they shall employ our thoughts and engross our sensibilities, even in our choicest moods.*

AFFINITY OF THE TURKISH AND SCOTTISH DIALECTS.

A Turk, several years ago, made his appearance in Edinburgh, in the costume of his country. Such a spectacle being a great novelty in the gude town, he was generally attended by a crowd of boys, who amused themselves by pestering him. With these he usually got in a passion, and turning fiercely round would address them by the most opprobrious name in his vocabulary, "*Giaour—Giaour*," (infidel). While in one of those moods, an old Scotchman took pity on him, and joined, as he thought, in his expostulation—"Fie, lads, dinna fash the puir body sae—do as he een bids ye—do *gic owr—gic owr*"—(give over).

* From the Leeds Mercury, April 13, 1833.

OLD ENGLISH ARMOUR.

Previous to the time of Edward the First, the body armour may be distinguished by the appellations of trelliced, ringed, rustred, mascled, scaled, tegulated, single-mailed, and banded. The trelliced method has not been properly ascertained; it properly consisted of leather thongs, crossed, and so disposed as to form large squares placed angularly, with a round knob or stud in the centre of each. The ringed consisted of flat rings of steel, placed contiguous to each other, on quilted linen. The rustred was nothing more than one row of flat rings, about double the size of those before used, laid half over the other, so that two in the upper partially covered one below. Mascled, the hauberk composed of several folds of linen, covered with diamond-shaped pieces of steel touching each other, and perforated, so called from their resemblance to the meshes of a net. Scaled, formed of small pieces of steel, like the scales of fish, partially overlaying each other. This species was used only during the reigns of Henry the Second and Richard the First. The tegulated consisted of little square plates, partly covering one another, like tiles. Single mail was composed of rings set edgeways on quilted linen. It came into use about the close of John's reign, and continued to be partially worn till that of Edward the First. At the commencement of Henry the Third's reign, it covered not only the head, but hands, legs, and feet. It was very heavy, and likewise the rings were liable to be cut off by the blow of a sword; which latter circumstance, perhaps, introduced the contrivance of banded armour, which was composed of parallelogramic pieces of metal, sewn on linen, so placed as to fold perpendicularly over each other, like palings, and kept in their places by bands or hoops of leather. We now come to the double-chain mail, consisting of interlaced rings, which made its first appearance in the triumphant reign of Edward the First. It is said to be of Asiatic invention, and was composed of four rings within a fifth, each of which was rivetted. Single chain mail was worn by the Crusaders, in Henry the Third's time; and when the number of rings was doubled, it became double-chain mail. Its great advantages were compactness and pliability. Horses were now clothed in mail. In the latter part of Edward the Third's reign, the double-chain mail became so covered with pieces of steel as to cause them in a little time to supersede it altogether. This, therefore, was termed mixed. The double-chain hauberk had been found, owing to its weight, to press injuriously upon the chest: to remedy which, a breast-plate of steel was contrived, which, being placed underneath, kept the mail from pressing upon the stomach. The throat was protected by a chain covering that surrounded the neck, and hung down the shoulders. We now come to plate armour. In Henry the Fourth's reign, the adopting of the mixed armour soon pointed out, by experience, the inutility of retaining the ringed hauberk. The thighs and legs were no longer covered with double-chain mail, and the arms only partially. A back-plate was added, which, with the beast-plate, formed a cuirass. During the use of mixed armour, the arms, thighs, knees, and legs, were covered with plates of metal; and for the hands were invented gloves of plate, with fingers, called gauntlets. From the conquest to the time of Richard the Third, the fashion was to ride with the toes down; after which period, the heel was dropped and the toe raised. Spurs were not screwed to the armour before the time of Henry the Fifth. No higher degree of perfection was ever attained in armour than during the reign of Richard the Third. The outline of the suit was most elegant, the workmanship most elaborate, and the choice of ornaments full of taste.—*Mirror.*

FASHIONABLE DINNER PARTY IN ABYSSINIA.

A great degree of scepticism has been entertained in regard to the mode of supplying *brinde* or raw meat, to the guests in the fashionable parties at Gondar, the capital of Abyssinia. When the company have taken their seats at table, a cow or bull is brought to the door, and his feet strongly tied; after which, the cooks proceed to select the most delicate morsels. Before killing the animal, all the flesh on the buttocks is cut off in solid square pieces, without bones or much effusion of blood. Two or three servants are then employed, who, as fast as they can procure *brinde*, lay it upon cakes of teff placed like dishes down the table, without cloth or any thing else beneath them. By this time all the guests have knives in their hands, and the men prefer the large crooked ones, which in the time of war they put to all sorts of uses. The company are so ranged that one gentleman sits between two ladies; and the former with his long knife begins by cutting a thin piece, which would be thought a good steak in England, while the motion of the fibres is yet perfectly distinct. In Abyssinia no man of any fashion feeds himself or touches his own meat. The women take the flesh and cut it lengthwise like strings, about the thickness of one's little finger, then crosswise into square pieces somewhat smaller than dice. This they lay upon a portion of the teff bread, strongly powdered with black pepper, or cayenne, and fossil salt, and then wrap it up like a cartridge. In the meantime, the gentleman, having put up his knife, with each hand resting upon his neighbour's knee, his body stooping, his head low and forward, and mouth open, very like an idiot, turns to the one whose cartridge is first ready, who stuffs the whole of it between his jaws at the imminent risk of choking him. This is a mark of grandeur. The greater the man would seem to be, the larger is the piece which he takes into his mouth; and the more noise he makes in chewing it, the more polite does he prove himself. None but beggars and thieves, say they, eat small pieces and in silence. Having despatched this morsel, which he does very expeditiously, his neighbour on the other hand holds forth a second pellet, which he devours in the same way, and so on till he is satisfied. He never drinks till he has finished eating; and before he begins, in gratitude to the fair ones who have fed him, he makes up two small rolls of the same kind and form, each of the ladies opens her mouth at once, while with his own hand he supplies a portion to both at the same moment. Then commence the potations, which, we are assured, are not regulated with much regard to sobriety or decorum. All this time the unfortunate victim at the door is bleeding, but bleeding little; for so skilful are the butchers, that while they strip the bones of the flesh, they avoid the parts which are traversed by the great arteries. At last they fall upon the thighs likewise; and soon after, the animal perishing from loss of blood, becomes so tough, that the unfeeling wretches who feed on the remainder can scarcely separate the muscles with their teeth. In the description now given, we have purposely omitted some features, which, it is not improbable, have been a little too highly coloured, if not even somewhat inaccurately drawn. But there is no reason to doubt the general correctness of the delineation, not excepting the grossest and most repulsive particulars.—*Dumfries Courier.*

ECONOMY OF TIME IN ENGLAND.

In England, time is a revenue, a treasure, an estimable commodity. The Englishman is not covetous of money, but he is supremely covetous of time. It is wonderful how exactly the English keep to their appointments. They take out their watch, regulate it by that of their friend, and are punctual at the place and hour. English pronunciation itself seems invented to save time; they eat the letters and whistle the words. Thus Voltaire had some reason to say, "the English gain two hours a-day more than we do, by eating their syllables." The English use few compliments, because they are a loss of time; they salute in a nod, or, at the utmost, a corrosion of the four monosyllables, "How d'ye do?" The ends of their letters always show more simplicity than ceremony; they have not "the honour to repeat the protestations of their distinguished regard and profound consideration" to his "most illustrious lordship," whose "most humble, most devoted, and most obsequious servants," they "have the honour to be." Their very language seems to be in a hurry; since it is in a great part composed of monosyllables, and two of them, again, are often run into one; the great quantity of monosyllables looks like an abridged way of writing, a kind of short-hand. The English talk little, I suppose, that they may not lose time; it is natural, therefore, that a nation which sets the highest value upon time should make the best chronometers, and that all, even among the poorer classes, should be provided with watches. The mail-coach guards have chronometers worth L.80 sterling, because they must take care never to arrive five minutes past the hour appointed. At the place of their destination, relations, friends, and servants, are already collected to receive passengers and parcels. When a machine is so complicated as England is, it is essential for every thing to be exact, or the confusion would be ruinous.—*Count Pecchio's Observations in England.*

MODES OF COMMUNICATING DISEASE.

There are two modes by which disease may be communicated; the first is by actual contact, or by the insertion or absorption of some visible matter from one body which is diseased into another in a healthy state; the second by a near approach to the diseased person, so that the breath, or some emanation from his body, may convey the infection to another which is previously in a healthy state. The measles, scarlet fever, and some other febrile diseases, are now familiarly known to be propagated in this latter manner. As an example of both modes of propagation, the smallpox may be cited, which may be conveyed to another either by inoculation or simply by approaching a patient labouring under this disease, or coming near or in contact with clothes that have been worn by him. In general, it may be said that noxious matters propagating diseases are either something visible and substantial, as seen in the pustules of the smallpox or the vesicles of cowpock, or something invisible, the existence of which is known only by its effects, as proved in the spreading of the measles, the scarlet fever, hooping cough, &c.—*Dr Macmichael on Cholera Spasmodica.*

FIGURES AND ASPECTS OF MEN.

It is a favourite amusement of mine to walk along a crowded street, and observe the various aspects of men—how some faces are long, some short, some hollow, and others prominent; and, withal, what a variety of expression animates the various physiognomies. There is an optical instrument called the anamorphosis, which, if you look into it one way, elongates you to a maypole, and, in another, makes you as broad and flat as a toad-stool. Nature, in scheming out men, seems to make use of a kind of anamorphosis of her own; and hence, in some figures we see every thing in long perpendicular lines, while in others all is latitudinal and horizontal. Some men seem as if they had been framed upon a bundle of spears; others upon a five-bar gate. Some men appear as if they had been looking into the hollow of a tea-spoon, and all at once, by some strange spell, had their features fixed in that configuration; others seem as if they had been petrified some day, while staring at themselves in the bulge of a spheroidal tea-pot. Some are born (to use the Earl of Pembroke's idea) of the poplar, others of the yew; and not in upright measurement alone are variations observable. Some men sink inwards about the middle like hour-glasses. Their heads and feet are in clumps, and their waists in threads. Nature, in fashioning them, seems to have fallen into a reverie, and rolled the clay so long between her hands, that the ends, before she was aware, had almost fallen away from the attenuated centre. Others again are almost perfect spheres; others nearly regular cubes, or crystals, with hardly any proper extremities, either for locomotion or for thinking; so that one might suppose Nature had been in a hurry in their case, and formed them much after the manner of boys fashioning snowballs in a thaw, or a man making nails at the rate of three hundred in the hour. Then, again, some men have straight legs, like two marks of admiration. Others have them bandy, like a pair of parentheses. Others are what is called knock-kneed, like the same figure with an inverse arrangement of parts. But, what is most strange of all, some men [Lintot, the celebrated bookseller, was a specimen, if we are to believe Dryden] have two legs of one kind—two left ones for instance. When both lie in one way, the effect is most singular. I remember a man of that kind, who went as straight forward as any man; but yet I never could resist the idea, that his walk *ought to have been* a series of circumgyrations, like the orbit of the moon round the sun. King James the First, according to Weldon, had a circular way of walking, and, in entering a room, we are to suppose he made a sweep towards the object, as one now-a-days drives round the lawn in front of a manor-house.

The size and arrangement of the feet of men are so various, that, while some seem to stand like the letter V upon a point, others have the broad basis of an A, and taper towards the crown. A few seem placed upon an X, and some spread out from the middle like a Y. On the other hand, take men in profile, and you will find some to be like the letter I, some like P, and some like f; the first being slim tall men, the second fat and protuberant of paunch, and the third having a strange droop of the head. Mark mankind as they walk past you, and you will find hardly one going at the same angle to the horizon as another. The military man perhaps walks pretty near the right angle; but hardly any others. The proud man is perhaps ten degrees off the perpendicular *backwards*; the [illegible]ng shopkeeper as much *forwards*. Some walk altogether upon their heels; others altogether upon their toes. Some men always seem following their noses; others come sulkily after their great toes. Some have themselves all thrown out towards the front, like bow-windows; show a great convex chest, shoulders well laid back; in fact, three-quarters of their persons seem to go before them. Others are all gathered coweringly inwards, like coiled hedgehogs—carry three-quarters of themselves behind—seem, in short, to be almost altogether composed of back. Some men come dancingly and easily up to you, whisk round you for a few moments, asking how you do, and then dance off as trippingly as they came. Other men come up with all the solemnity of a chest of drawers, pronounce a few grave words like the base sounds of an organ, and then go lumbering on as before, without having altered a muscle.

The way in which the head is carried makes a material difference in the aspects of men. Some have the occiput laid quite back upon the neck, so as to realise the classical idea of the great distinction of the human race—"*vultus ad sedera.*"* A man conscious of good looks or of good birth, and who does not need to stoop to common-place employments, may carry himself thus. He is then said to be a man of noble air—a man with a presence. But if one knows that he is tolerably plain, and has to bow fifty times a-day over a counter to whomsoever may give him a trifle, he carries his face rather below the level than above it. He knows he would only be ridiculous, if detected putting on fine airs, by persons who, on other occasions, had seen him manifesting all the obsequiousness of a tradesman. A mercantile nation must thus look a little nearer the ground, upon the whole, than an idle and military one. The habit of command gives a peculiar air—an air of confidence, firmness, and dignity—which the man who is accustomed to obey can never reach. There is also a completeness of visage about some men—an integrality of feature I may call it—which sets them at their ease with themselves and others, and conduces greatly to make up a presence. A man of this kind can do without a collar—almost without a neckcloth—he will look well any way. Others, again, whose physiognomies are not so perfect—whose faces, as it were, want bottom—require a calix, as the botanists would say, wherein to rest the head; which purpose is served by a stock and its usual appurtenances. It is a great mistake which some men commit—the idea that they can do without what Captain Clutterbuck calls an inch of clean linen: very few men, indeed, have that classical elegance and completeness of visage, which may enable them to bear up under such a want. A matter of this kind cannot be left to fashion; or, if fashion will insist upon all following one model, it is the height of cruelty in those who look well without collars, to institute such a mode, as it inevitably puts thousands of their fellow-creatures to the alternative of looking like masterless dogs, or breaking through a rule more imperative than the principles of virtue. Painters and sculptors are always complaining about the way in which the necks of mankind are used. No doubt, the Hercules Farnese and the Apollo Belvidere would not be improved by a collar and stock; but the *beau-ideal* is one thing, and the common run is another. The necks of mankind in general could never stand such an exposure.—To return to the angle of the visage, it is surprising how much it affects the voice. Your lofty man seems to speak from the point of his chin; your long-nosed boring man spins out his words at his proboscis; and the obstinately modest and bashful man generally addresses you from a corner of his forehead. Every head has its ecliptic as well as its equator; and there is always one point which is more generally presented to the spectator than any other: that I call the point of voice—the mouth has nothing to do with it.

To come to features—it is astonishing how various are their forms in different men. The profile of Louis the Sixteenth was altogether, apparently, moulded in a circle: the brow, the nose, the chin, all formed segments of circles in themselves, and, in the whole, composed only a larger segment. Such faces we see every day; and we as frequently see others, in which the form is entirely reversed. Such are the dish faces, where the features seem arranged within a crescent, and the point of the nose does not advance so far as either the brow above or the chin below. Some faces go outwards to a point at the tip of the nose; others go inwards to a point at the root of the same feature. Some noses are isosceles triangles; others equilateral; others have the base by far the longest side. Some are tuberous; others acute. Some spring out like the style of a dial; others look as if they had been clashed against the face in a soft state, and by that means pressed broad and flat, like a piece of clay thrown hard at a wall. Sometimes the base is level; sometimes hollow; sometimes convex. The people of a certain remote insular district have their nostrils drawn strangely up; so that they always appear as if they were in a passion, while in reality they are as well tempered in general as the rest of his Majesty's subjects. In some men, the nose is pointed downwards to the upper lip; in others, it tends upwards to the brow; and it is an ascertained fact that not one in five hundred has it exactly in the centre of the face. Some men, moreover, have its point drawn to one side, some to another—like a helm when in the process of turning a vessel. In various instances I have seen it so much abreast, that I really wondered how the owner got on at all, especially with a wind right a-head. A weathercock with a flank to the breeze would have been no greater phenomenon.

I now come to speak of the various characters which may be read in the faces of a passing crowd. Some who have not been in the habit of studying human character any where, may not recollect being struck with the infinite variety there to be observed. Yet there are some points which may be easily brought to the remembrance of the most careless on-looker. How absorbed some men appear! Their souls, like their eyes, seem set far back in their heads, and they move along the street seeing every thing, but never showing as if they saw at all. They wink, for the ordinary refreshment of the organs; but no other muscle ever plays. In some, the absorption is that of pride—in some, that of indifference. Such persons are like coffins sent out to take the air. The great mass of mankind, in walking the streets, have pretty much one look—something between the smirk of actual conversation and the coldness of perfect tranquillity or reverie. They hold themselves ready, if they are not strangers to the place, to break into a smile as they pass a friend. But there is a set who do not conform to this general system, and may be described as a counterpart to the haughty and the cold. These people wear their heart on their lips, and in their eyes. As you pass them, you feel convinced that you must know them, and that they know you. They just look as if they were addressing you—as if they were saying, "My dear fellow, how are you?" And it requires an effort to keep your hand from going forth of its own accord and seizing theirs. As they go along with this perpetual salutation in their looks, they leave all who pass them in the same state with yourself; and perhaps two hundred persons at once are saying to

* The face towards the heavens.

themselves, "Surely I have seen that gentleman before." Such a man will lay waste a whole street with bewilderment in five minutes. There is a peculiar twitchiness about the noses and upper lips of some men, which contributes to give them this universally familiar air. I have long marked a person of this kind, and who moreover has that ruddiness of complexion which betokens the *bon-vivant;* and he always appears to me as if he were going about seeking to make up a party for a beef-steak in some neighbouring tavern. Though I have no acquaintance of him, I daily expect him to address me as follows:—"I say, can't we have a few oysters to-night at Gabriel's?" He is a kind of Vanderdecken—always wishing to get some one inveigled into a share of his own fate. I have resolved, however, to have nothing to do with him. It would never do for a person of my retired habits. He would introduce me to the whole town in a moment.

ROADS.

Every schoolboy can illustrate the political importance of good roads in securing conquests and facilitating civilization, by referring to the Roman ways. Their effects upon the wealth and prosperity of a country, though generally alluded to, have not yet received that share of attention to which they are entitled. It is, however, in some means through increased facilities of transport that subsistence is provided from inferior soils for an increasing population, at the same rate of cost as originally was paid to raise it from the most fertile land. By the saving of time, and by the cheap rate at which goods and passengers are conveyed from place to place, a country well intersected with roads is enabled to make head against a general low rate of profit, and in some cases to overbalance, by those means, the advantages of a fruitful soil, the finest climate, and a great productiveness even to half-trained industry. In America and Spain, for example, a part of the crops is left to rot upon the ground, because there are no roads to remove it. In the last named country, sheep are (or were) often killed for the fleece only, and the carcass abandoned, as the expense of conveying it to any distance along the miserable ways would be greater than its value. We may put a case which comes closer to our fireside feelings: the cost of a ton of the best coal, at the pit's mouth—the actual value of the mere commodity—is about 11s.; the direct and indirect charges of (water) carriage to London are about 9s., or not very far short of the cost of the commodity. In stones, slates, &c., the expense of conveyance is still greater; so great, indeed, as to prevent, with our present means, their internal transport for any distance by land. Every thing, therefore, connected with the improvement of roads, is of the utmost importance to public and individual wealth.

The first thing to be done in road-making is to fix the inclination, and lay down the line of road. The rise should never be greater than 1 in 35; the line, if possible, should be straight. When hills have to be crossed, it may be eventually advisable to deviate from the direct line, and not return to it. A curved course, if any thing is gained by it, seems not objectionable; a crooked one appears never proper; but a roundabout way sometimes, as when a succession of hills intervenes—it being easier, and even shorter, for example, to pass half round the bottoms of several sugar loaves, than to go up and down them. When vallies have to be crossed, it may be done by embankments, or by a viaduct. Here, again, a deviation from the straight path may be prudent, if it is rewarded by a gentler ascent and descent to fill up. In seeking for it, you may go up the valley, or against the stream as it were, though at times a sudden narrowing of the opposing hills may more than counterbalance increased depth by greater shortness. In the case of rivers, a change in the course of the road may take place, if the stream be very wide, or the banks so low as to be liable to be flooded for some distance. Woods, bogs, or marshes, should be avoided, as the worst of obstacles to a good road, for reasons to be mentioned presently. A road should never undulate, but should gradually incline upwards to the highest point. Unless under very peculiar circumstances, it should not be turned aside for the sake of seeking a town. If the townspeople wish, they must, like Mahomet, go the road, not the road to them. Some little relaxation may be allowed in avoiding to pass through private grounds, if such avoidance does not materially interfere with the main objects of the road, or cause additional expense. For these and other obvious reasons, the suggestions of gentlemen of property, or practical men of the greatest experience, in the neighbourhood, should be received with caution.

After the line has been laid down, with such deviations as the circumstances of the surface may have suggested, it must be gravely considered whether it be better to hold straight on, or to follow the longer course with the easier inclinations. In the first case, hills will have to be cut through, and slopes formed at each side of the road. Embankments must be raised, or viaducts built, bridges erected over rivers, causeways made over flats, and bogs and marshes effectually drained. All these things, or any portion of them, can only be accomplished at considerable expense: but then, the road will be much shorter; the great object of its creation—a quick communication between two points—will most effectually be answered; and there will be a great saving in the annual wear and tear of horse-flesh and vehicles, and in the greater cheapness of transport. The original outlay, too, may be less than it at first appears: by keeping the straight line, less road will have to be made, and considerably less to be kept in repair; the earth or substratum may in some cases be much firmer, and the expense of forming the *bed* consequently less; the materials may be closer at hand; and the earth which is dug up in cutting through hills may be applied to the levelling of inequalities, for which materials must have been procured. From the scientific knowledge and practical skill requisite to procure these data for calculation, as well as from the experience and sagacity necessary to come to a right conclusion, it will be seen that *every man* is not qualified to be *his own road-maker;* and that the formation of highways and by-ways is no such easy task as country squires in their innocence have fancied.

When the line is finally decided on, the making begins. The qualities desiderated in a good road have been defined by Macbeth: a perfect way should be "whole as the marble, founded as the rock."

This can never be accomplished if the subsoil or foundation be bad. Is it spongy?—part of the materials of the road will sink into the foundation, part of the foundation rise up into the road, and cause inequalities and ruts. An elastic soil is worse. If the reader has ever seen a gentleman, not "very well set upon his pins," endeavouring to cross a plank which might serve a mountebank for a spring-board, he has seen an example of elasticity. This quality, though not to the extent perhaps of the instance selected, is present in all bogs, marshes, and bottom land; and, unless destroyed by draining and compression, it will always cause a momentum in the road which passes over it, no matter how excellent the formation itself may be; and this swing, though imperceptible in the working of the horses, will show itself visibly enough in their condition. A good foundation or bed for the road must be found or formed, or all the rest will be but labour in vain.

In a *complete* road, perfect hardness is a *sine qua non*—because, the harder the surface, the less the friction of bodies passing over it, and by consequence less force is required to put and keep them in motion; but this quality is not easily obtained. Trustees, indeed, have imagined, that, by laying on a quantity of gravel spread smooth, or a succession of coatings of broken stones, *hardness* will be obtained; a miserable mistake, followed in a few years by a bad state of roads—fresh repairs to be succeeded by rapid dilapidations, and crowned at the last by a swinging debt. The reason is, that "the carriages passing over the stones will force those next the earth into it, and at the same time press much of the earth upwards between the stones: this will take place to a great degree in wet weather, when the bed of the earth will be converted into soft mud by water passing from the surface of the road, through the broken stones, into the bed of the road. In this way a considerable quantity of earth will be mixed with the stone materials laid on for forming the crust of the road; and this mixture will make it extremely imperfect as to hardness," and shortly cause ruts and other inequalities. The exact degree of firmness required in a road must of course depend upon the traffic upon it; but in all first-rate roads, where the vehicles are numerous and heavily laden, it will be best and cheapest to form the bottom with a regular pavement of large stones, set close, with the broadest face downwards, the interstices to be closely filled up with stone chips, well driven in, so that the earthy bed of the road cannot be pressed up and mixed with the broken stones forming the surface or crust of the road. If the funds would admit of it, in communications between great towns and approaches to capitals, it would be advisable to have the centre crust of the road paved for heavy laden vehicles, and the sides only of broken stones to be used for carriages. Should the money be insufficient to form the entire foundation of pavement, then the middle can be so formed, and the side bottom made of broken stones. The road itself should be highest in the centre, sweeping down to the side-channels, so that the rain may run off as fast as it descends. These side-channels should be constantly kept clear; and when a branch or field road joins a main road, the junction should never interfere with the channel, but always take place on the field side. Drainage, both by main and cross drains, is an object of the first importance, so as to keep the road as *dry* as possible. The friction on the crust, no matter if it be the hardest pavement, will inevitably grind a part of it to powder, which, when combined with wet, will act with increased effect. The hardest marble, nay, the diamond itself, can be cut without any other composition than water and its own dust.

People differ in their ideas of beauty. The unknowing like what pleases them: the skilful like what is useful, which is also pleasing to the mind's eye. Formerly, we preferred a road bordered by high hedgerows, pretty thickly studded with stately trees; the character being given rather by age and wide-spreading branches, than by mere loftiness—the banks somewhat lofty, and at times shooting up and overhanging like a cliff—their clothing various, now covered with long lank grass, looking as though they concealed something mystic; now short and smooth, and tempting the youthful passengers to try the steep ascent; now bare, and worn into little furrows, like the cheek of eld, with the gnarled and knotted roots of ancient trees obtruding through—the road itself of various inclinations and of various widths; sometimes opening into a "green," at others widened by patches or strips of unenclosed common, occasionally narrowing and passing through well-protected woods, "whose leafy shades high overarched embower," whence issue the deep murmur of the dove or the chatter of the magpie, whilst game of various kinds flutters or darts across the road. Very beautiful are such scenes in summer to the eye of the Cockney. Even when winter has stripped the trees of their foliage, and the land of its teeming richness and its varied hues—when the gusty wind sweeps along the open country, and moans or whistles through the naked branches—they are not divested of charms, but look lovely even in desolation. All these things, however, are an abomination to the eye of the scientific civil engineer. Trees or overhanging hedges retain the wet, and saturate the road with an artificial shower after the natural one has ceased. When the sun comes forth, their shade intercepts his beams—their close texture, the action of the air; and thus the wet is retained by preventing evaporation. By shutting out the free current of air, they may fatigue and injure the horses, "whose powers to perform work with ease, especially when moving rapidly, depend upon the quantity of cool and fresh air that they can pass through their lungs." The only banks that a skilful road-maker can tolerate, are those which are formed at a due inclination, according to the nature of the materials. The finish which best pleases the eye of the engineer, is a neat stone or brick wall, just high enough, if on a causeway or by a precipice, to prevent a *flushed* gentleman from tumbling over; in the case of an embankment, it is all-sufficient if it check naughty children from running up the slope, or the slope itself from slipping into the road. Wherever it is practicable, a public road should be above the level of the country through which it passes, to secure dryness and hardness, to give the animals labouring on it a free current of fresh air, and to guard against the possibility of floods.*

THE RUNAWAY SLAVE.

During a short residence at the Cape of Good Hope, I lodged at the house of an old merchant of the name of Peter Brown. He was an Englishman, but had been settled at the Cape long before it became a British colony, having gone to sea when a boy, and forsaken his ship in an India voyage, when the fleet stopped to water in Table Bay: he had here risen step by step from the rank of a common sailor, till he was now an independent and even opulent merchant. His manners and temper retained a good deal of their original harshness; but his knowledge of business, and remarkable punctuality, made him a most eligible person to deal with. He was tall, uncommonly stout, and of a fair complexion, which was excessively tanned by the sun in his yearly journeys through the colony, among all sorts of half-civilised Africans and semi-barbarised Europeans. His chief fault was the uncommon severity with which he treated his slaves—a mode in which the violence of his temper seemed to seek a vent for itself, while restrained into calmness and civility, by motives of self-interest, during intercourse with his equals.

There were several of his slaves whom he let out as watermen to carry passengers from shore to the ships, or from one ship to another. I had had occasion for the services of two of them in going out to the Indiamen in the bay one evening after a heavy squall: the poor fellows had very hard work, for the sea still rolled high; but they laboured with great activity, and brought us through several dangers, by the dexterity of one of them in particular, who was called Tom. They landed me opposite Mr Brown's house, which was a little neat edifice in a row of others of the same kind fronting the beach, each of which had a small fore-court, with two or three trees, and a seat at either end, where the inmates could at all times find relief from the hot suns of this sultry climate. When I stept up into this enclosure, I found my host resting himself in one of the seats, fatigued as well as myself, and with his temper apparently a good deal ruffled. As I came up, he said, "Ah! well, you have been at sea this evening as well as I. I hope you have met with better success; but there is always something to trouble us. Here, Tom (calling my boatman), bring a glass of grog for each of us." I mentioned that I seldom drank any thing at that hour. "Oh, it will do you good, after being tumbled about in the bay so lustily: bring the liquor, Tom." Tom vanished into the house, and in a minute returned with a small tray, holding glasses with water and spirits. Having first supplied his master, he brought the materials to me, and poured out some rum. As I, however, had no intention of sharing in this hospitality, I motioned him to put it back into the decanter, which he did. Brown had seen me decline drinking, but had not apparently observed what occurred afterwards; and as the man was carrying away the tray with the empty glass, it suddenly took

* Condensed by the Spectator from Sir Henry Parnell's work on Roads, just published.

him in the head that Tom had drunk the spirits intended for me. His temper, as I mentioned, had been already ruffled by some occurrences in business; and now, without deliberating a moment, he snatched a heavy walking-stick, and hurried into the house after the slave. I of course could only wonder what he intended; but in a few seconds I heard loud cries from one party, and curses from the other, mixed with the sound of heavy blows—"Oh, sir; oh, sir—don't, sir, don't—God have mercy!" And then, "You rascal, you, I'll teach you to drink my liquor. You scoundrel, have I not kept you since you were able to crawl, like a black beetle as you were?—have I not fed you, and clothed you?—and have I not given you a wife, you rascal? And this is the return you make. Your wife and your black brat shall no longer live in my house." All this time the blows were thundering on the poor slave, sometimes hitting him cruelly, sometimes rattling on the chairs and tables, behind which he took refuge—a disappointment which at once jarred the old man's arms and his temper. The poor slave never offered the slightest resistance, nor said a word in his own defence, but contented himself with imploring mercy, and endeavoured to ward off the blows from his head by receiving them on his arms. He at last ran into the kitchen (his wife was cook), whither he was pursued by his master. I had attempted to follow, and interfere, but in vain; and now there ensued another storm of beating and imprecations, in the midst of which I heard the sudden shriek of a child, followed by a loud and pitiful outcry, apparently in a female voice. In a very few moments Mr Brown made his appearance, with a kind of alarm in his look, which seemed for the moment to have banished his irritation: the female wailing still continued, and he shut the doors anxiously behind him, as if to prevent its reaching me. On approaching, he endeavoured to resume his usual manner, and said, "that rascal had the impudence, I saw, to drink the liquor intended for you; but I have given him a lesson he wont forget." I endeavoured to explain that the slave was not to blame; but the old man only replied, "Oh, it is very well meant in you to excuse him; but I saw how the matter stood: no slave of mine shall play such tricks." Seeing that I should only irritate him farther by persisting, I said nothing more, and soon after we parted for the night.

I breakfasted abroad, and did not again meet Mr Brown till the afternoon, when I saw him at a public sale. He stood beside me for a short time speaking of indifferent matters; and then of a sudden, assuming a sort of serious and concerned air, he said, "I am sorry I shall not be able to remain longer; I have to attend the funeral of poor Tom's child, which died this morning. Tom is a very useful fellow, and I wish to pay him that mark of respect." He said this with a look of condescending sympathy, which sat but hypocritically on his hard features. I had no remark to make, except the question, "Ay, how did the child die?" Mr Brown turned away abruptly, as if attending to something else for a moment, and then answered, "Oh, some children's disorder, no doubt—fits, I believe, it was." And then deputing me to finish some business for him, he went hurriedly out. As he departed, I could not help recollecting the occurrences of the night before—the shriek of the child, and the long helpless wailings of the mother (for such she must have been); and I was convinced, that, in his reckless punishing of the poor slave, Brown himself had, by some blow or other accident, killed the child. The event proved that I was right.

It was late before I got home, and I found Brown pacing about through his little court-yard in what he himself would have called "a great rage." He was stamping on the ground and muttering to himself when I entered, but calmed his passion a little as he began to speak. "Would you have thought it?" he said; "that rascal Tom, after I have fed him, and clad him, and kept him, all his life, what has he done? The villain has run off to the mountain, and deprived me of one of the best and stoutest of my slaves—the gallows dog! and he has taken his wife with him, too! It will cost me more than a thousand rix-dollars to get a cook and waterman again to answer my purpose. He is an idle villain, and never would put his hand to any thing but an oar. But he shan't escape me: I shall catch him if he were hidden in a monkey's nest. To carry off my cook, too! the scoundrel!" He ran on in this way for some time, though he must have known perfectly that his own cruelty was the cause of the whole mischief. I never saw a stronger instance of the obtuseness, both of feeling and reasoning, which is generated by the habit of tyrannising over slaves.

"Where can they have gone to?" I asked. "Oh, gone to the mountain, no doubt; and he thinks they will be safe there till they get some rascally boor to take them into his service. But I shall take care of them; we shall be after them to-morrow night; you may accompany us if you please." I had frequently heard of runaway slaves taking refuge among the crevices and shelves on the precipitous front of Table Mountain, and had seen fires glimmering among the high rocks, which were said to be kindled by them; but I had scarcely ever credited the actual possibility of such a thing: and even now I listened to Mr Brown's statement as something very improbable. "Why, how can any people live on the face of a perpendicular wall of rock, Mr Brown? If they could even get lodged there, they would still be in a state of starvation; your cook will have little to do so high in the air." "They steal, the rascals, they steal; they come down in the night from their black rookery, and carry off every thing they can lay their hands on. But will you go with us to-morrow night? that is the question." "With all my heart," said I: "I have clambered up the face of a rock many a time before to catch young hawks or jackdaws; and I should like to see how negroes build their nests in a crag, which is so much higher and wilder than any I ever scaled before." In truth, I was moved, partly by curiosity, and partly by the hope, that, if I could see and speak with the poor runaway, I might be able to render him some service.

The Table Mountain is 3500 feet high, nearly half of which elevation forms an upright rocky wall, two miles long; this immense precipice can be scaled to the top by a kind of gulley or water-track, which ascends its face by oblique reaches; but the rock is also marked across its length by numbers of long narrow shelves like footpaths, which run slanting in various directions, and afford footing to monkeys or goats. In these tracks there are sometimes broader spots, or recesses scooped as it were out of the rock, where it would just be possible for a human being to fix his lodging if he could reach them, and if he had the firmness to pitch his tent on a dizzy ledge, where the wide bay beneath (the anchorage of fleets) seems diminished to a pond, and the city to a small map. It is in such places as these that a few runaway slaves are said to take refuge, and to remain till they find some way of escaping from the colony, or till their offences are forgotten. The few practicable spots where they can possibly lodge themselves on the rock are pretty well known; so that, when a master is willing to encounter the danger, and has trusty assistants, it is generally possible for him to recover a deserter. This, however, is seldom done; few slaves care to seek refuge in such a wild fastness; and when they do, their masters have seldom the hardihood to pursue them. In the present case it was otherwise: Brown was determined, he said, to show his people that no such escapes should be permitted by him.

The hour fixed was about seven o'clock in the evening; and I met the party beyond the town-gardens: they consisted of some files of European soldiers, and six or seven of Brown's favourite and most trusted slaves. The foot of the precipice was still about a mile distant, and the road consisted of a steep ascent, in great part strewed with fragments of rock of all sizes, which seemed to have tumbled from the crags above, and rendered the path almost impracticable. The rock itself stood close above us, huge and dark. It was not dark, however, at all points; for in one or two places the fires which I have mentioned had been kindled, and, as was not unfrequent, they had caught the dry grass and shrubs of the ledges where they burned, and were extending right and left in long lines of fire along the face of the precipice. Their light had no effect whatever in illuminating the vast mass of darkness presented by the rock, which looked even more sombre by the contrast. The effect was wild and striking, and when associated with the idea that the slaves might kindle such fires all around us when we ventured up into their haunts, the matter wore even a more serious aspect. We soon arrived at the entrance of the gulley by which we were to ascend: it looked as dark as the road downwards to Acheron; for the walls on each side shut out the starlight, and we dared not open our dark-lanterns lest we should betray our errand. Two sentinels were placed at the bottom, and we proceeded. Mr Brown held on his way perseveringly, clambering over smooth shelves of rock, or scaling up among heaps of stone that had fallen into the track; and every one followed him in silence, all intercourse being transacted by signals. When one in front found a shrub by which he could pull himself up, he pushed it in silence to his successor; or if he stumbled into a hole, he contented himself with striking the rock with his cane, to put the others on their guard. The ascent, though inclining sometimes one way, sometimes another, was all along most fatiguingly steep; and my legs never felt more relieved than when, after about an hour and a half's ascent, a signal was passed along the line that we were to halt here.

When I came to the front, Mr Brown said to me, "the rascal must be hereabouts: it takes too much practice of footing among the rocks for beginners to venture farther; he would neither go himself nor take his wife into the dangerous places; he was too fond of her—confound him! Do you stop here with the sentinel and this slave, while I and the rest, who have some notion of their haunts, will creep along these footpaths in the face of the rock." "I shall go with you, Mr Brown." "Nay, nay," replied he, "you will have work enough, I warrant; whenever you hear a shot, you will speed in that direction—you are our reserve; and if you second us well, we shall have both the vagabonds well flogged and in irons by to-morrow morning."

The work was detestable; but I did as he desired, and was speedily left alone with the sentinel and slave; the rest creeping away by twos and threes along some of the ledges or goat-paths so often mentioned. We soon lost sight of them all, and were left solitary and dark; there was nothing to gaze at save the sky, for the land below seemed but a dim formless void; and the diminished bay was hardly seen glimmering faintly in the starlight.

We had remained in this situation for ten or fifteen minutes, when the slave said that he heard some rustling among the bushes on the path taken by Mr Brown, and shortly after several stones were thrown among us from the same place. The slave and sentinel made ready their arms, and crept cautiously to the spot, so that I remained quite alone. They had not left me above two minutes when I heard some one call my name from above, and in an instant the apparition of poor Tom came sliding down a piece of rock, and stood by my side. I was astonished beyond measure, but he motioned a request that I would not speak, and coming near enough to be heard in a whisper, he said, "you are good man, sir, and will not hurt poor slave; I see you kind man when I row you to ships in de bay. I run away wid poor Mary, because he kill my child. I not mind him beat myself, but if he beat my wife and child I must run away. I want go to England, sir; I am good boatman: will you help poor fellow to go?" I was puzzled and confounded. "Why, Tom, you will be taken; the sentinel will be back instantly." "Oh, no," said Tom, with half a laugh, "he will be keep searching yonder—my old comrade will take care of dat: he did it to help me. None of them will tell where I am—all know. But will you get ship for me going to England, sir?" I was thinking of an answer to this odd application, when I heard the voice of Mr Brown only a few yards behind me. Tom started and looked for a hiding-place, but speedy escape was almost impossible, and the poor fellow trembled like an aspen leaf. Immediately I heard Mr Brown cry, "Ah, I have found you, scoundrel!—you shan't escape, I assure you." There was then a hurried rustling among the bushes, as if he was pushing forward somewhere, and directly afterwards a cry, "Lord preserve me!" when something was heard to fall heavily on an inferior ledge of rock. Tom had escaped, and stood alone in suspense and horror, not knowing what had happened. In a few moments the sentinel and slave whom I had sent out came forward, and their explanation of the matter was dreadful. It appeared that Mr Brown, in returning along the narrow footpath, had seen this slave, and had mistaken him for Tom: in his hurry to apprehend him he had rushed forward over some bushes, one of which caught his foot, and threw him directly down the precipice. There could be no question as to his fate; he must have been killed ere he had fallen ten yards.

We waited till morning, and sought for his remains. The appearance was too dreadful to be described; there was no vestige of the human form in the bloody and disfigured mass which we lifted from the rugged stones at the foot of that terrible precipice.

With the aid of some friends, I had an arrangement effected with Mr Brown's widow concerning the runaway Tom, and his wife, whom every one allowed to have been cruelly treated. They got their liberty, and seemed to be in a way of doing well when I left the Cape.

FRENCH MANNERS IN THE SEVENTEENTH CENTURY.

It is curious to look into the old writers on polite behaviour, and to observe with what care they prescribe rules for avoiding habits, which every body now-a-days knows—we might almost say by intuition—to be offensive, and into which nobody but the merest clown is in the smallest danger of falling. In this paper we shall give an account of a few of the instructions laid down, in a work entitled "The Rules of Civility," for the guidance of the young noblemen and gentlemen of France in the seventeenth century. The reader will be amused with some, on account of their extreme minuteness, and with others, as they show that the models of fashion to Europe had then scarcely escaped from habits of living far from being remarkable for nicety, or even cleanliness.

In a visit to a nobleman in those times, the stranger entered with his gloves on, and his hat in his hand, which he put on only if requested to do so by his lordship. Hats, it may be observed, were then worn within doors, and even at table, and were pulled off in acknowledgment of personal compliments, or when the names of the relations of the noble master of the family happened to be mentioned. If the visitor came to welcome the great man home from a campaign, or if he had not seen him for a long time, his obeisance was performed with somewhat of eastern humility: he was to bow very low, and, taking off his glove, put his hand to the ground: in recovering the upright posture, the motion required to be slow and deliberate, for if his lordship was standing near, and made a bow of acknowledgment, and if his client whipt up his head in too great a hurry, he might receive a violent blow on the face with the back part of it, before he had time to avoid the collision. After greetings past, the visitor took care to place himself in a seat less dignified than that occupied by his lordship—a

chair with arms being considered the best, one with a back the next, and a stool the least honourable; he was to sit in a lower part of the room, and if his lordship shifted his position, he was to countermarch him, so to speak, without any ostentation or clatter, so as still to preserve the inferior place. Upon the same principle, we presume, though we do not find it enjoined, if the great man moved from an arm-chair to one with a back only, his guest was bound to quit his chair with a back, and to occupy a stool, and to stand, if the nobleman changed to a stool. To sit sidewise, was more respectful than to place oneself full in the face of a superior. It was looked upon as ill breeding if the visitor, when seated, either clapt his leg upon his knee, played with the tongs, or tampered with the fire, and, above all, if he punched his lordship on the stomach, in order the more certainly to attract his attention to any part of the conversation. A practice, to which the people of Holland are said to be much addicted, was then considered as to be avoided as much as possible, and a handkerchief to be always employed. "And now I speak of a handkerchief," adds our author, "it is not decent for you to offer it to any body to make use of, though it be never so clean, unless it be expressly desired." In the matter of sneezing, if his lordship was seized with a fit, the person present was not to bawl out, "God bless you!" but to make a handsome bow, and repeat that obsecration inwardly. If the inferior himself could not refrain from sneezing, he was at least to do it gently, and not shake the foundations of the house with his sternutations. If his lordship entered into conversation with another nobleman, the visitor could not, without infringing decorum, address himself in the meantime to any of the rest of the company; and if a personage inferior in degree to the master of the house came in, it was ill-bred to salute him before those of higher rank had gone through the ceremony of greeting.

In *conversation with the great*, much circumspection was necessary, both in managing the voice and in the manner and substance of the discourse: the speaker was neither to whisper so low that his noble patron should be obliged to ask what he had said, nor to bawl so loud as to make the apartment ring again. To put a question expressly and abruptly, as, "will your lordship do so and so?" was a piece of extreme rudeness—the interrogation, if it could not be avoided altogether, was to be thrown into an indirect form, as, "doubtless it is your lordship's intention to perform this or that."

An aspirant after court favour would have had little chance in those days to obtain his end, if, having got hold of a piece of fresh intelligence, and flattering himself that now he should bind his patron wholly to his interest, he hastened to his hotel, and communicated the tidings as entirely new. A person better schooled would enter in an easy way, and merely allude to the facts, as if he supposed them to be already well known to the statesman; thus avoiding offence—it being a point of moment with politicians to have it generally believed that they had perfect information concerning public affairs long before all other people. Eminent personages could ill endure to think they were surpassed in any thing by those beneath them in rank; and, therefore, a well experienced favourite or dependent, rather than deliver an advice in a formal manner, spoke as if reminding them of something which they had forgotten.

In *playing any game with a man of rank*, an inferior was placed in a critical situation—if he won, there was a chance of incurring displeasure; while, on the other hand, if he was intentionally negligent and lost, there was a risk that his titled opponent, if possessed of any penetration, should suspect the truth, and be affronted to find himself treated like a self-willed child. The safest way, in most cases, seems to have been to manage, to exert as much skill as was necessary, without taking the game; for the harder won it was, the better pleased the patron was sure to be; and the loser's reputation was likely to be advanced by some such praise from the gainer as this—"He is one of the best players I ever met with—it was with the greatest difficulty I could beat him." By neglecting this prudent course, a Spanish grandee fell into disgrace with Philip the Second. Having played a very long time at chess with that monarch, and been invariably the gainer, he perceived at his departure that his majesty was deeply chagrined. On reaching home, therefore, he said to his family, "My children, we need remain no longer at court; we have no more good to expect in that quarter—the king is enraged at me for beating him at chess."

In *dining with people of quality*, the cloak and sword were not put off; we have already mentioned that the hat also was worn. Sitting down to table thus incumbered, the guest, however weary or hungry, are not to loll with his elbows on the board; nor to fix his eyes upon the dishes, as if he would devour all; nor to thrust in his plate eagerly in order to be first helped; nor to put great gobbets of meat into his mouth, so as to bunch out his cheeks like a monkey; nor to swallow ravenously and choke himself; nor, if the pottage was hot, to blow every spoonful with his breath; nor to scoop out of the plate with his finger the gravy that remained after he was done eating; nor to break the bones at table, in order to obtain the marrow; nor to lick his fingers; nor to pick his teeth with a knife or fork; nor to blow his nose without holding his hat before his face; nor to speak with his mouth full. It had formerly been the custom to take the meat in the fingers, which were afterwards wiped upon the cloth, or on the bread, or with a napkin; this practice now began to be looked upon as sordid, and was on the decline in genteel families. Our master of ceremonies repeatedly warns his disciples against it. "Touch nothing," he says, "but with your fork"—"The best way to keep the fingers clean is to use a fork." The knife and fork, however, were not then employed exactly in the modern way: it was usual, in the first place, to cut the meat into pieces, which were afterwards eaten with the fork. Eating out of one common dish was not yet exploded; but the use of the spoon was undergoing several changes, some of which our author seems to have thought rather finical, though, as the teacher of an art wholly regulated by fashion, he makes no objection to their being adopted. "If we be to eat out of the dish," he says, "we must have a care of putting in our spoons before our superiors, or of eating out of any other part of the dish than that which is directly before us; much less are we to pick out the best pieces, though we be the last that help ourselves. Having served yourself with your spoon," he adds, in another place, "you must remember to wipe it; and indeed as often as you use it, for some are so nice they will not eat pottage or any thing of that nature in which you put your spoon unwiped, after you have put it in your mouth. Others, again, are so curious they will not endure a spoon to be used in two several dishes; and, therefore, in several places 'tis grown a mode to have spoons brought in with every dish, to be used only for pottage and sauce." In drinking, the mouth was always to be wiped before beginning: it savoured of too much familiarity to sip one's wine, and of clownishness to take it with loud gulps, or to drink so long as to be forced to fetch a loud sigh in order to recover breath: the liquor was to be taken at one quiet and leisurely draught, with the eyes fixed on the bottom of the glass, and not rambling up and down the room among the company. Finally, at the table of a person of honour, to put sweetmeats or fruit in the pocket, or to set by any thing in a plate for the purpose of carrying them home, was an extreme incivility, unless the entertainer pressed and commanded his guest to do so.

Recreations out of doors were likewise performed with their peculiar ceremonials of courtesy. In walking, the inferior took the left side, and at the end of the promenade always turned with his face towards his superior; when three walked together, the middle was the place of honour; if two noblemen of equal quality placed a private gentleman between them, in order the better to hear his discourse, he was to turn at one end of the alley towards one of them, and at the other end towards the other; and the moment his narrative was finished, he was to resume the left hand place. "If you meet full with a person of quality in the streets," says our author, "you must run presently toward the channel, or post yourself so as he may pass by with his left hand towards you; and the same rule is to be observed with coaches." If an endeavour were made at the present day to perform this latter piece of courtesy in the streets of London, what a confusion, crashing, and bawling would ensue, and what a rejoicing among the coachmakers!

In riding, the inferior gave the right hand to his companion, and kept at a modest distance behind him, unless the wind whirled the dust about his lordship, in which case he changed to the right hand, and humbly received the dust himself. Though, as has been said, it was civil to keep a little way behind, yet if a ford or slough was to be passed, it then behoved the poor dependent to make the first venture. In hunting, the principal man of the party was not to be outridden, but to be suffered to come first in at the death. If the deer stood at bay, and there was occasion for a weapon to strike him down, nobody was to be too forward until they saw how his lordship was disposed to act.

In *writing a letter to a nobleman*, large paper was used as being more respectful than small, and a whole sheet was taken, although the epistle consisted of no more than six lines. Certain cases, however, permitted the economy of half a sheet; as, if it contained only some short compliment, or was sent to remind him of something more amply explained before; but it was requisite to fold the paper, and make it up in the same manner as a full sheet. It was reckoned more genteel to put the date, day of the month, and year, at the end, on one side of the page, than at the beginning; for by this means the word "Monsieur" or "Monseigneur" was left in undisturbed dignity in a large domain of blank at the top. This usage, however, though still common, is not without inconvenience; for throughout the letter there may be allusions to time—as the mention of yesterday, and so on—which cannot be understood without knowing when the epistle was penned. Accordingly, some ingenious persons have of late invented a method by which both the time of writing may be seen before commencing the perusal of the letter, without the awkwardness of turning to the end to find it, and the title "My Lord," or "Sir," may still enjoy the honours of uninvaded seclusion; this method consists in writing the date in a line along the left edge of the paper. When the writer wanted to add at the end an additional item of respect, he used a cover or envelope; a letter to a lady of great quality was sealed with silk, and sometimes, for the greater honour, it was first sealed with silk; and then an envelope, containing the superscription, was added.

Having thus given a sketch of the most remarkable rules in "The Rules of Civility"—many of them, as has been already observed, remarkable on account of their frivolity, and, one would think, their needlessness—we cannot better conclude than in the words of the author, who, after some remarks on the changes that are constantly taking place on the manners of a people, adds, "So, then, 'tis clear custom can improve, abolish, or change laws as it pleases; and 'tis possible may do so by mine. Nevertheless, civility proceeding essentially from modesty, and modesty from humility, which stands, like the rest of the virtues, upon unshakeable principles, 'tis certain, though custom may change, civility will not—for he will always be civil that is modest, and he always modest that is humble."

RAMBLES IN THE METROPOLIS.

THE SEAT OF GOVERNMENT.

THE united cities of London and Westminster, with their suburbs, extend between seven and eight miles along the borders of the Thames, in a direction nearly from east to west, and expand between five and six miles from north to south; while on either point new streets, crescents, and squares, are invading the fields and the groves, giving to many of the approaches a picturesque and a beautiful appearance.

London, properly so called, is situated at the eastern part of the densely crowded seat of commerce, interspersed with manufactories, warehouses, and flanked by quays and docks of great extent. Westminster is the western portion of the immense metropolis; but to the stranger who perambulates the streets, the one appears so close in connection with the other, that there is no obvious distinction. The large and long thoroughfare called the Strand, in Westminster, is a continuation of Fleet Street in the city; and on this line, which is densely crowded with shops, may be perceived many recent improvements of great architectural elegance. The Strand is terminated on the west by an open area named Charing Cross, from which radiate various thoroughfares, one in a westerly direction leading towards Pall Mall and the fashionable end of the town adjacent to the Parks, and another in a southerly direction, called Whitehall Street, leading to the Houses of Lords and Commons, and Westminster Abbey. On the north side of Charing Cross, a wide open space has been formed by pulling down a number of buildings; and here the great National Gallery is to be erected. This open space, which is to be called Trafalgar Square, is already adorned on the east with St Martin's church, a building of the Corinthian order of architecture, and on the west by the Union Club House and the College of Physicians. The centre of the area of Charing Cross is rendered conspicuous—it cannot be said to be ornamented—by an equestrian statue of Charles the First, elevated on a pedestal, and said to be the first erected in England, on the spot where Edward the First raised a cross to Eleanor his queen. It being at present our object to describe Whitehall Street, in and about which the vast transactions connected with the government of the British empire are conducted, we shall in the meanwhile proceed with the stranger along that thoroughfare.

Whitehall Street possesses the usual bustle of the main streets of the metropolis, but its bustle is of a peculiar kind. It is a bustle which seems to have an official look about it, and is not of that commercial character perceivable on the east side of Temple Bar. The street is capacious and dignified in its aspect. As you look along it, various public structures attract the eye. The first building of this nature you come to is one situated on the right-hand side, called the ADMIRALTY. It is an extensive edifice of brick and stone, with a lofty portico in the centre, and projecting wings, forming a court with a screen next the street, decorated with naval emblems. Here the Lords of the Admiralty transact all business of importance relating to naval affairs. On the summit of the edifice may be seen a telegraph capable of carrying on rapid communication with distant ports in the British Channel: an order from it to fit out a fleet will in two or three minutes set all Portsmouth in motion. Adjoining to this massy structure stands the ARMY PAY OFFICE, a substantial brick edifice, from which there is a fine view, through Whitehall Place, of Waterloo Bridge, the winding of the Thames, and the noble dome of St Paul's.

A little farther on the right is a splendid edifice called the HORSE GUARDS, from its being the chief

station of the household troops. The building consists of a centre, with wings, built of stone in 1730. Within are levee and waiting rooms of the commander-in-chief—the offices necessary to the business of the war department. There are accommodations for horse and foot soldiery, their suttling-houses, stables, &c. On a cupola over the central gateway is a clock, which being scientifically regulated every morning, gives the true time to the inhabitants of Westminster. Towards the street there are lofty iron railings and gateways, and at each extremity is a stone structure, in which sit horse-soldiers in full uniform, others in the court-yard and gateways doing duty on foot. This building presents one of the noblest entrances to St James's Park.

Adjoining is an elegant mansion, with a stone portico projecting over the foot pavement; it is called Melbourne House, from having been the residence of that nobleman. Next to this is that portion of old Whitehall Palace which was built by Cardinal Wolsey; in this there is an entrance to the TREASURY, its front being in St James's Park. The Lords of the Treasury here hold their boards or meetings, at which the accounts of the realm are investigated.

Opposite, on the left, is the Banqueting-House, called WHITEHALL, which is certainly a splendid specimen of Inigo Jones's talents as an architect. It is built of stone, enriched by pillars of the Ionic and Composite orders, with festoons of fruit and flowers between the capitals, giving elegance to the windows beneath. The interior is a spacious room forty feet high: the ceiling represents the apotheosis of James the First, painted by the immortal Reubens. The building has been converted into a military chapel, and around the walls are suspended warlike trophies taken from the French and Spanish armies. In the front of this building, on a scaffold before one of the windows, Charles the First was beheaded. In a narrow paved thoroughfare in the rear, stands a bronze statue of James the Second. Onward is an extent of iron railing, enclosing plantations of trees and shrubs, behind which are several residences of noble personages on the bank of the Thames, commanding scenes of considerable beauty: this retired spot is called Privy Gardens, being a portion of the pleasure-grounds belonging to the ancient palace.

Opposite, on the right, is the COUNCIL OFFICE, an edifice recently built of stone after the designs of Soane, in the Corinthian style of architecture, richly embellished. The interior is very magnificent; the Council Chamber is lofty as the building; the ceiling curved, and finished by a lantern. Here his Majesty's Privy Council decree on appeals, and transact other state affairs.

On the side of this building, to the right, is DOWNING STREET, in which are the entrances to the residences of the ministers of state, the offices of the foreign department, and others connected with diplomacy, the windows of all facing St James's Park. It is matter of surprise to many, who reflect, while their eyes range up and down this insignificant short street of brick houses, that hence have been issued dictates which regulated some of the greatest events recorded in the annals of Europe.

Opposite to the Council Office, at the commencement of Parliament Street, on the left, is RICHMOND TERRACE, occupying a part of the ancient garden to Whitehall Palace, and once the mansion of the Dukes of Richmond and Buccleuch. The terrace has been recently built of brick and stone, in fine taste, adorned with Ionic columns filling the area between Parliament Street and the river, a situation which gives a commanding prospect of the leading features of the metropolis. Here resided the statesmen Fox and Canning.

The great width of Whitehall Street is here divided into two, both proceeding in the same direction—King Street on the right, and Parliament Street on the left; at the extremity of which are streets at right angles, leading eastward to Westminster Bridge, and westward to St James's Park. In issuing at the southern extremity of Parliament Street into Palace Yard, a scene of architectural splendour bursts upon the eye. Immediately in front is the CHAPEL OF HENRY THE SEVENTH, a beautiful specimen of the florid Gothic style of architecture, adorned with projecting octagonal towers decorated with a profusion of sculpture; it forms the eastern end of WESTMINSTER ABBEY, the body of which is partly hidden by the parish church of St Margaret, while the great northern entrance, and the lofty towers at the western porch, rise magnificently on the right; beneath which appears the GUILDHALL, or the court of sessions for the city of Westminster, an octagonal brick building, with a vestibule supported by Doric columns, occupying part of the ancient sanctuary. An iron railing surrounds the space in front of the abbey, a part of which is planted with trees and shrubs, and laid out in walks; within this railing, and facing Palace Yard, stands a bronze statue of George Canning. On the left, WESTMINSTER HALL appears in solemn grandeur, its centre richly sculptured on either side the entrance, above which is a lofty Gothic window surmounted by a lantern of excellent workmanship. On either side are towers ornamented with corresponding taste, presenting a fine specimen of ancient greatness. On its side nearest to the abbey are the COURTS OF LAW; beyond which is the entrance to the HOUSE OF COMMONS; the visible building being committee-rooms and offices; the part where the members assemble in debate is in the rear.

Adjoining is the HOUSE OF LORDS, a building of considerable extent in the Gothic style, with a colonnade and entrance porch occupying the eastern side of Old Palace Yard. The House of Lords is a spacious apartment of an oblong form, with galleries on the sides. One end is railed off, which part is denominated "below the bar;" at the other end is the throne, elevated a few steps above the floor. A splendid canopy of crimson velvet, with gold lace, fringe, and tassels, surmounted by a crown, expands over the throne, sustained by richly carved and gilt columns; the surface behind the throne is superbly decorated with the armorial bearings of his Majesty.

The seats of the Lord Chancellor and the judges are woolsacks, the seats of the Peers are benches all covered with crimson cloth, some placed parallel with the sides of the apartment, others across or facing the throne. The walls are hung with tapestry in various compartments, representing the defeat of the Spanish armada, in 1588, bordered with portraits of the commanders on that memorable occasion. Magnificent chandeliers are pendant from the lofty ceiling, the whole producing an effect of grandeur and elegance.

The Painted Chamber and the Star Chamber may be seen, but they offer nothing worthy of notice; they, like the cellar of Guy Faux, are converted into ordinary appendages to the House of Lords.

The communication between the two houses is by means of badly-lighted passages. The lobby of the Commons' House is spacious, the ceiling sustained by numerous columns; at the farther end is the entrance for the members; on either side are covered seats for the door-keepers, near which may be seen posted the orders and the routine of motions coming before the house. The interior has precisely the appearance of a church: it was built by Edward the Third for a collegiate church, on the site of a chapel built by Stephen, and dedicated to the saint of that name. Since the reign of Edward the Sixth, it has been the House of Commons. The Speaker's seat is elevated near the farther end; beneath are seats, and a table for the clerks of the house. The seats of the members are on either side, in five ascending rows, at the back and in front of the Speaker's chair; also in the side galleries. The gallery in front of the Speaker is appropriated to strangers and reporters; immediately beneath is the bar, where persons examined by the house are placed. The treasury benches are those nearest the Speaker's chair on his right; those on his left are occupied by the members denominated the Opposition.

Returning from the House of Commons, at the bottom of a stone stair, a narrow passage leads into Westminster Hall. The effect produced by its expanse and ancient dimly-lighted roof, is very imposing: it was built by William Rufus, in 1098, as a banqueting-room. The measurements are 270 feet in length, 74 in width, and 90 in height, exceeding in dimensions any room in Europe void of central support. The roof is curiously constructed, and richly carved in the Gothic taste. Massive beams of oak project from the walls on both sides, about one-third the width of the building. Each extremity represents an angel holding a shield, on which appear the armorial bearings of Richard the Second, and of the preceding monarch; from these projecting beams timbers ascend to the roof, all carved in Gothic forms, their height being regulated by the diagonal lines of the cross timbers. This hall was attached to an ancient palace; its site gives name to a paved square adjoining, called Palace Yard. In this spacious room portions of the coronation ceremonies take place—the challenge of the champion, the feast, and the banquet. This magnificent apartment can hardly be looked upon, by the stranger who is conversant with the history of Great Britain, without having called up in his memory many of the important transactions which have occurred under its sombre roof. Here, the Scotsman, at least, will recollect, that, five hundred years since, Wallace, the great hero of his country, was subjected to a contumelious trial, and condemned to the scaffold. Here, among other prominent recollections of later date, will arise the extraordinary scene which took place in January 1649—a king tried by a party of his subjects, and condemned to lose his head on the block. The present aspect of the hall, imposing though it be, and however interesting from historical association, is cold, cheerless, and desolate. Its bare walls, its dirty stone pavement (for it answers the purpose of an alley for a public thoroughfare from Palace Yard to the street towards Millbank), and, in short, its total want of what constitutes comfort in an apartment, are highly unfavourable to its appearance.

On the left, entering by the passage before mentioned, are the courts of law, their designations being written over their respective entrances. The Court of Chancery is a square room, with a circular gallery, the whole apartment not being larger than one of the divisions of the Court of Session, at Edinburgh, and not nearly so commodious. The seat of the Lord Chancellor is elevated; and beneath him, on a large table, lie the mace and great seals. The seats of the counsel are in front of the Chancellor; the suitors have seats in the rear, and strangers have standing room on either side. The Vice Chancellor's Court, the Courts of Common Pleas, of Exchequer, and King's Bench, are similar, except that there are several seats for the increased number of judges. All these courts of law are built of stone on the western side of the hall, their fronts facing Westminster Abbey.

Our space being exhausted, we shall embrace another opportunity of taking a walk with the stranger through Westminster Abbey and its sacred precincts.

OLD KENTUCKY.

BEFORE saying another word on the subject of the western states of America, we must give a sketch of Kentucky—"Old Kentucky," as it is called by its peculiar race of inhabitants, from its long standing among the inhabited territories of Mississippi valley. The state of Kentucky is bounded on the north by the Ohio river, which separates it from the states of Ohio, Indiana, and Illinois: on the west it is bounded by the Mississippi, which separates it from the state of Missouri; and on the east it has Virginia, an Atlantic state. Kentucky thus lies farther south than those states we have already described, and has therefore a warmer climate. It is a slave-holding state, and emigrants will hold this circumstance in view in proposing to make it their home. Kentucky measures 400 miles in length, by a medial breadth of 150 miles. In 1830 it had a population of 518,678 whites, and 165,350 slaves; total, 688,844.

Almost the whole of this state in its configuration belongs to the valley of the Ohio, a portion also inclining to the Mississippi. The rivers Tennessee, Cumberland, and Kentucky, have likewise broad and deep vallies. The valley of Green River, and that in the central parts of the state, are noted for their extent, beauty, and fertility. Kentucky has been generally estimated to possess larger bodies of fertile land than any other western state; and although nothing can exceed the beauty of the great valley, of which Lexington is the centre, yet there are in Kentucky large sterile tracts, and much land too mountainous or too poor for cultivation. The central parts of the state are described as delightfully rolling. A tract of country, nearly a hundred miles in one direction, and fifty in the other, is found here, which, for beauty of surface, amenity of landscape, the delightful aspect of its open groves, and the extreme fertility of its soil, exceeds perhaps any other tract of country of the same extent. The land rests generally on limestone, and so much of this fossil is dissolved and mixed with the soil, as to impart to it a warm and forcing quality. Through this beautiful country meander the Little Sandy, Licking, Kentucky, and Salt rivers, and their numerous tributaries. The woods have a charming aspect, as though they were promiscuously arranged for a pleasure-ground. Grape-vines of prodigious size climb the trees, and spread their umbrageous leaves over all the other verdure. Black-walnut, black-cherry, honey-locust, buck-eye, pawpaw, sugar-tree, mulberry, elm, ash, hawthorn, coffee-tree, and the grand yellow poplar trees, which indicate the richest soil, are every where abundant. In the early periods of spring, along with the purple and redundant flowers of the red-bud, and the beautiful white blossome of the dog-wood, there is an abundance of that beautiful plant the May-apple, the rich verdure of which has an indescribable effect upon the eye. The trees generally are not large, but tall, straight, and taper, and have the aspect of having been transplanted to the places which they occupy. That part of the state which borders on Tennessee and Virginia, resembles the country in the vicinity of the Alleghanies in Tennessee. The landscape-painter might come here, and find that nature had transcended any mental conceptions of the perfection of scenery. The numerous mountain branches wind round the bases of the small table hills, cutting down deep and almost frightful gullies, and forming "caves," as they are called by the people, or gulfs, covered with the shade of immensely large poplars, often eight feet in diameter. Such a tree will throw into the air a column of an hundred feet shaft. No words would convey adequate ideas of the lonely beauty of some of these secluded spots.

Between the rolling fork of Salt river and Green river is a very extensive tract, called "Barrens," the soil of which is generally good, though not of the first quality. But the country, partially covered with trees, is covered with grass like a prairie, and affords a fine range for cattle. Between Green and Cumberland rivers is a still larger tract of "Barrens." Spread over this district is an immense number of knobs, covered with shrubby and post oaks. In the year 1800, the legislature made a gratuitous grant of 400 acres of this land to every man who chose to become an actual settler, and the consequence was, that many occupants were found on these terms. The country has proved to be uncommonly healthy, and abounds in game, which is free to all. Swine are raised with the greatest ease, and enough of land is cultivated to supply all wants. The district has indeed come into reputation; and they who received their farms as a free gift, are now living comfortably, and rearing respectable families in rustic independence.

For variety of hill and dale, for the excellence of the soil, yielding in abundance all that is necessary for comfortable subsistence, for amenity of landscape, beauty of forest, the number of clear streams and fine rivers, health and the finest developement of the human form, and patriarchal simplicity of rural opulence, it is questionable if any country can be found

surpassing Kentucky. "We have heard the hoary 'residenters,'" says Timothy Flint, "the compatriots of Daniel Boone, speak of it as it appeared to them when they first emigrated from their native Virginia and North Carolina. It was in the spring when they arrived. The only paths among the beautiful groves were those which the buffaloes and bears had broken through the cane-brakes. The wilderness displayed one extended tuft of blossoms. A man stationed near one of these paths could kill game enough, with a proportion of turkeys and other large birds, in an hour, to supply the wants of a month. There can be no wonder that hunters, men who had been reared among the comparatively sterile hills of Virginia and North Carolina, men who loved to range mountain streams and sheltered glades, should have fancied this a terrestrial paradise. The beautiful configuration of the soil remains; but the whole state is studded with plantations, and the buffaloes, the bears, the Indians, and the wild and much of the beautiful of the country, are now no more."

"In my whole tour through this state," says the same author in a different work, "I experienced a frank and cordial hospitality. The general kindness with which I was every where received [Mr Flint, it should be mentioned, travelled as a preacher], impressed me so much the more forcibly, for being unexpected. The Kentuckians, it must be admitted, are a high-minded people, and possess the stamina of a noble character. It cannot be said correctly, as is said in journals and geographies, that they are too recent and too various in their descent and manners to have a distinct character as a people. They are generally of one descent, and are scions from a noble stock—the descendants from affluent and respectable planters from Virginia and North Carolina; and are in that condition in life, which is, perhaps, best calculated to develope high-mindedness and self-respect. We aim not in these remarks at eulogy, but to pay tribute where tribute is due. It is granted there are ignorant, savage, and abandoned men among the lower classes of Kentucky; but where are there not such?" Great exertions have also been made to reclaim the idle and dissipated portion of the population, and in time the disorderly will be properly restrained. "Kentucky," Mr Flint adds, "is proudly exalted as a common mother of the western states. It seems to be generally understood that birth and rearing in that state constitute a kind of prescriptive claim upon office. Hence, from the falls of St Anthony to the Gulf of Mexico, and from the Alleghany hills to the Rocky mountains, the character of this state has a decided preponderance. Her modes of thinking and action dictate the fashion to the rest, and the peculiar hardihood, energy, and enthusiasm of her character, will tend long to perpetuate this empire.

The enthusiasm of the Kentuckians is very observable, in the ardour with which all classes of the people express themselves, in respect to their favourite views and opinions. Hear them rate their favourite preacher: he is the most pious and powerful preacher in the country. Their orators and their statesmen, in eloquence and abilities, surpass all others. The village politicians have an undoubting and plenary faith, that whatever measures the Kentucky members espouse in Congress, not only ought to prevail, but will prevail. The long line of superlatives, the possession of the best horse, dog, gun, wife, statesman, and country, are felt to belong to them in course." In short, the inhabitants of this state aspire to take the lead in every thing in the western country; and it will require no small degree of perseverance and self-possession in an emigrant from the old world to compete with the arrogant Kentuckian, who, according to Flint, "when the warmth of whisky in his stomach is added to his natural energy, becomes in succession horse, alligator, and steamboat." But to proceed with our details.

Kentucky possesses many fine rivers besides the Ohio, the chief of which are navigable for great distances. Of these Cumberland river is a large stream uniting with the Ohio by a mouth 300 yards in width. It is a broad, deep, and beautiful river, and may be navigated 300 miles in its course. The river Kentucky is navigable 150 miles, and Green river is boatable 200 miles. The principal towns and villages in the state are situated on the banks of the chief rivers. Frankfort, the political metropolis of the state, is situated on the north bank of the Kentucky, 60 miles above its entrance into the Ohio. It is a respectable town of about 2000 inhabitants, and the houses are singularly neat in appearance. Lexington, situated on a branch of the Elkhorn river, 25 miles south-east from Frankfort, is one of the oldest towns in the western country, and now possesses a population of upwards of 6000 inhabitants. It possesses many excellent institutions, including the Transylvania University, and various public offices. The chief manufactures are those of cotton bagging, and various kinds of cordage. There are three factories for spinning and weaving wool, and five or six for cotton, and one large and several smaller machine-making factories. In the woollen factories are manufactured handsome carpets. The environs of the town have a singular softness of landscape, and the place wears an air of neatness, opulence, and repose, indicating leisure and studiousness, rather than the bustle of business and commerce. The main street is a mile and a quarter in length, and 80 feet wide, well paved. In the centre of the town is the public square, surrounded by handsome buildings. In this square is the market-house, which is amply supplied with all the products of taste. The inhabitants are cheerful, intelligent, conversable, and noted for their hospitality to strangers. The professional men are distinguished for their attainments in their several walks. The university, with its professors and students, and the numerous distinguished strangers that are visiting here during the summer months, add to the attractions of this fashionable city.

Louisville, at the falls of the Ohio, in a commercial point of view, is the most important town in the state. The rise of this town has been wonderfully rapid: In 1800, it had no more than 600 inhabitants; in 1810, 1350; in 1820, 4012; and in 1830, 10,336. This large and improving town stands on the Ohio, at a spot near its greatest fall. It has thus come to be a place of deposit for goods passing on the river; and the transport from the vessels above the falls to those below, or *vice versa*, till lately, took place by carrying overland. This difficulty is now overcome by a canal of two miles in length, and forty feet in depth, on a scale to admit steam-boats and vessels of the largest size, which connects the navigation of the river. Such are the local resources and active character of the inhabitants of Louisville, that it is not thought that this canal will injure its trade and commerce. The country around is one of the most fertile and best settled districts in the state. The other towns in Kentucky are Maysville, Washington, Paris, Georgetown, Versailles, Newport, Covington, Cynthiana, Port William, Russelville, besides forty or fifty considerable villages.

From what appears to be the condition and character of this thriving and opulent state, it is obviously not the spot to which the poorer class of emigrants ought to direct their attention; perhaps artizans, who wish employment in the towns, excepted. A great proportion of the Kentucky lands being already well settled, and brought into a good state of cultivation, the value of farms must therefore be high, and better suited for capitalists than those districts not yet reclaimed from the forest. To those who have money to lay out on good cleared lands, Kentucky offers eminent advantages. All the grains, pulses, and fruits of the temperate climates, she raises in the greatest abundance. Her wheat is of the finest kind; and there is no part of the western country where maize is raised with greater ease and abundance, while her produce is at once carried off by a multitude of boats to New Orleans, and other markets. It is, indeed, not uncommon for the growers of produce of this state, on arriving at New Orleans, to ship, on their own account, to the Atlantic states, to Vera Cruz in South America, and to the West Indies. Immense quantities of flour, lard, butter, cheese, pork, beef, Indian corn and meal, whisky, cider, fruit, and manufactured goods, are thus exported from the industrious villages and farms of Kentucky. Horses are likewise raised and exported in great numbers, and of the noblest kinds. In 1828, the value of cattle, horses, and swine, driven out of the state, numbered and valued at one point of passage, the Cumberland ford, was a million dollars; a year later, the value of exports, agricultural and manufactured, by a partial return, was about three millions of dollars; and the products of agriculture and manufacture have since increased to a considerable extent, indicating that "Old Kentucky" still keeps ahead of any other state in the western country.

OLIVE HATHAWAY.

A VILLAGE SKETCH.

[By Miss Mitford.]

One of the principal charms of this North-of-Hampshire country consists in the infinite variety of woody lanes, which wind along from farm to farm, and from field to field, intersecting each other with an intricacy so perplexing, and meandering with such a surprising round-about-ness, that one often seems turning one's back directly on the spot to which one is bound. For the most part these rough and narrow ways, devoted merely to agricultural purposes, are altogether unpeopled, although here and there a lone barn forms a characteristic termination to some winding lane, or a solitary habitation adds a fresh interest to the picture.

These lanes, with their rich hedgerows, their slips of flowery greensward, and their profound feeling of security and retirement, have long been amongst my favourite walks; and Farley-lane is perhaps the prettiest and pleasantest of all, the shadiest in warm weather, and the most sheltered in cold, and appears doubly delightful by the transition from the exposed and open common from which it leads.

It is a deep, narrow, unfrequented road, by the side of a steep hill, winding between small enclosures of pasture land on one side, and the grounds of the great house, with their picturesque paling and rich plantations, on the other; the depth and undulations of the wild cart-track giving a singularly romantic and secluded air to the whole scene, whilst occasionally the ivied pollards and shining holly-bushes of the hedgerow, mingle with the laurels, and cedars, and fine old firs, of the park, forming, even in mid-winter, a green arch over head, and contrasting vividly with a little sparkling spring, which runs gurgling along by the side of the pathway. Towards the centre of the lane rises an irregular thatched cottage, with a spacious territory of garden and orchard, to which you ascend, first by a single plank thrown across the tiny rivulet, and then by five or six steep [illegible] in the bank—an earthen staircase. This [illegible] as long as I can remember, the habitation of [illegible] chael Strong, a laundress of the highest [illegible] in Aberleigh, and of her young niece, Olive [illegible] way. It is just possible that my liking for [illegible] of these personages may have somewhat bi[illegible] opinion of the beauty of Farley-lane.

Olive Hathaway has always appeared to me a very interesting creature. Lame from her earliest childhood, and worse than an orphan—her mother being dead, and her father, from mental infirmity, incapable of supplying her place—she seemed prematurely devoted to care and suffering. Always gentle and placid, no one ever remembered to have seen Olive gay. Even that merriest of all hours—the noon-day play-time at school—passed gravely and sadly with the little lame girl. A book, if she could borrow one, if not, knitting or working for her good aunt Rachael, was her only pastime. She had no troop of play-fellows, no chosen companion—joined in none of the innocent cabal or mischievous mirth of her comrades; and yet every one liked Olive, even although cited by her mistress as a pattern of sempstress-ship and good conduct—even although held up as that odious thing, a model—no one could help loving poor Olive, so entirely did her sweetness and humility disarm envy and mollify scorn.

On leaving school she brought home the same good qualities, and found them attended by the same results. To Rachael Strong her assistance soon became invaluable. There was not such an ironer in the county. One could swear to the touch of her skilful fingers, whether in disentangling the delicate complexity of a point-lace cap, or in bringing out the bolder beauties of a cut-work collar—one could swear to her handiwork just as safely as a bank clerk may do to the caligraphy of a monied man on 'Change, or an amateur in art to the handling of a great master. There was no mistaking her touch. Things ironed by her looked as good as new, some said better; and her aunt's trade throve apace.

But Olive had a trade of her own. Besides her accomplishments as a laundress, she was an incomparable needle-woman; could construct a shirt between sunrise and sunset; had a genuine genius for mantua-making; a real taste for millinery; was employed in half the houses round as a sempstress at the rate of eightpence a-day; devoting by far the greater part of her small earnings to the comforts of her father, a settled inhabitant of the workhouse at Aberleigh. A harmless and a willing creature was poor William Hathaway; ay, and a useful one in his little way [illegible] my part, I cannot think what th[illegible] without him at the workhouse, where [illegible] several departments of man and ma[illegible]-all work, ging the garden, dressing the dinner, running on errands, and making the beds. Still less can I imagine how the boys could have dispensed with him; the ten-year-old urchins with whom he played at cricket every evening, and where the kind and simple old man, with his lean, tall person, his pale, withered face, and grizzled beard, was the fag and favourite of the party, the noisiest and merriest of the crew. A useful and a happy man was poor William Hathaway, albeit the proud and the worldly wise hold him in scorn; happiest of all on the Sunday afternoons, when he came to dine with his daughter and her good aunt Rachael, and receive the pious dole, the hoarded halfpence or the "splendid shilling," which it was her delight to accumulate for his little pleasures, and which he, child-like in all his ways, spent like a child on cakes and gingerbread.

There was no fear of the source failing; for gentle, placid, grateful, and humble, considerate beyond her years, and skilful far beyond her opportunities, every one liked to employ Olive Hathaway. The very sound of her crutch in the court, and her modest tap at the door, inspired a kindly, almost a tender, feeling for the afflicted and defenceless young creature whom patience and industry were floating so gently down the rough stream of life. Her person, when seated, was far from unpleasant, though shrunken and thin from delicacy of habit, and slightly leaning to one side from the constant use of the crutch. Her face was interesting from feature and expression, in spite of the dark and perfectly colourless complexion, which gave her the appearance of being much older than she really was. Her eyes, especially, were full of sweetness and power, and her long straight hair parted on the forehead, and twisted into a thick knot behind, gave a statue-like grace to her head, that accorded ill with the coarse straw bonnet, and brown stuff gown, of which her dress was usually composed. There was, in truth, a something elegant and refined in her countenance; and the taste that she displayed, even in the homeliest branches of her own homely art, fully sustained the impression produced by her appearance. If any of our pretty damsels wanted a particularly pretty gown, she had only to say to Olive, "make it according to your own fancy;" and she was sure to be arrayed, not only in the very best fashion (for our little mantua-maker had an instinct which led her at once to the right model, and could distinguish at a glance between the elegance of a countess, and the finery of her maid), but with the nicest attention to the becoming in colour and in form.

Her taste was equally just in all things. She would select, in a moment, the most beautiful flower in a garden, and the finest picture in a room; and going about, as she did, all over the village, hearing new

songs and new stories from the young, and old tales and old ballads from the aged, it was remarkable that Olive, whose memory was singularly tenacious for what she liked, retained only the pretty lines or the striking incidents. For the bad or the indifferent she literally had no memory: they passed by her as the idle wind, that she regarded not. Her fondness for poetry, and the justness of taste which she displayed in it, exposed poor Olive to one serious inconvenience: she was challenged as being a poetess herself; and although she denied the accusation earnestly, blushingly, even fearfully, and her accusers could bring neither living witness nor written document to support their assertion, yet so difficult is it to disprove that particular calumny, that, in spite of her reiterated denial, the charge passes for true in Aberleigh to this very hour.

Such was and such is Olive Hathaway, the humble and gentle village mantua-maker; and such she is likely to continue; for, too refined for the youths of her own station, and too unpretty to attract those above her, it is very clear to me that my friend Olive will be an old maid. There are certain indications of character, too, which point to that as her destiny: a particularity respecting her tools of office, which renders the misplacing a needle, the loss of a pin, or the unwinding half an inch of cotton, an evil of no small magnitude; a fidgetty exactness as to plaits and gathers: a counting of threads and comparing of patterns, which our notable housewives, who must complain of something, grumble at as waste of time; a horror of shreds and litter, which distinguishes her from all other mantua-makers that ever sewed a seam; and, lastly, a love of animals, which has procured for her the friendship and acquaintance of every four-footed creature in the neighbourhood. This is the most suspicious symptom of all. Not only is she followed and idolised by the poor old cur which Rachael Strong keeps to guard her house, and the still more aged donkey that carries home her linen, but every cat, dog, or bird, every variety of domestic pet that she finds in the different houses where she works, immediately following the strange instinct by which animals, as well as children, discover who likes them, makes up to and courts Olive Hathaway. There's a magic about her placid smile and her sweet low voice, no sulkiness of bird or beast can resist their influence.

And Olive hath abundance of pets in return, from my greyhound Mayflower, downwards; and indeed takes the whole animal world under her protection, whether pets or no; begs off condemned kittens, nurses sick ducklings, will give her last penny to prevent an unlucky urchin from taking a bird's nest; and is cheated and laughed at for her tender-heartedness, as is the way of the world in such cases.

Yes, Olive will certainly be an old maid, and a happy one—content and humble, and cheerful and beloved! What can woman desire more?*

THE CULTIVATION OF THE MIND.

It is not without reason that those who have tasted the pleasures afforded by philosophy and literature, have lavished upon them the greatest eulogiums. The benefits they produce are too many to enumerate, valuable beyond estimation, and various as the scenes of human life. The man who has a knowledge of the works of God in the creation of the universe, or in the immense system of the material and intellectual world, can never be without a copious fund of the most agreeable amusement. He can never be solitary; for in the most lonely solitude he is not destitute of company and conversation: his own ideas are his companions, and he can always converse with his own mind.

How much soever a person may be engaged in pleasures, or encumbered with business, he will certainly have some moments to spare for thought and reflection. No one who has observed how heavily the vacuities of time hang upon minds unfurnished with images and unaccustomed to think, will be at a loss to make a just estimate of the advantages of possessing a copious stock of ideas, of which the combinations may take a multiplicity of forms, and may be varied to infinity.

Mental occupations are a pleasing relief from bodily exertions, and that perpetual hurry and wearisome attention, which, in most of the employments of life, must be given to objects which are no otherwise interesting than as they are necessary. The mind, in an hour of leisure, obtaining a short vacation from the perplexing cares of the world, finds, in its own contemplations, a source of amusement, of solace and pleasure. The tiresome attention that must be given to an infinite number of things, which, singly and separately taken, are of little moment, but, collectively considered, form an important aggregate, requires to be sometimes relaxed by thoughts and reflections of a more general and extensive nature, and directed to objects of which the examination may open a more spacious field of exercise to the mind, give scope to its exertions, expand its ideas, present new combinations, and exhibit to the intellectual eye, images new, va[illegible] sublime, or beautiful.

The time of action will not always continue. The [illegible] ought ever to have this consideration present to their mind, that they must grow old, unless premature death cut off by sickness or accident. They ought to contemplate the certain approach of age and decrepitude, and consider that all temporal happiness is of uncertain acquisition, mixed with a variety of alloy, and, in whatever degree attained, only of a short and precarious duration. Every day brings some disappointment, some diminution of pleasure, or some frustration of hope; and every moment brings us nearer to that period, when the present scenes shall recede from the view, and future prospects cannot be formed.

This consideration displays, in a very interesting point of view, the beneficial effects of furnishing the mind with a stock of ideas that may amuse it in leisure, accompany it in solitude, dispel the gloom of melancholy, lighten the pressure of misfortune, dissipate the vexations arising from baffled projects or disappointed hopes, and relieve the *tedium* of that season of life, when new acquisitions can no more be made, and the world can no longer flatter and delude us with its illusory hopes and promises.

When life begins, like a distant landscape, gradually to disappear, the mind can receive no solace but from its own ideas and reflections. Philosophy and literature will then furnish us with an inexhaustible source of the most agreeable amusements, as religion will afford its substantial consolation. A well-spent youth is the only sure foundation of a happy old age: no axiom of the mathematics is more true, or more easily demonstrated.

Old age, like death, comes unexpectedly on the unthinking and unprepared, although its approach be visible, and its arrival certain. Those who have, in the earlier part of life, neglected to furnish their minds with ideas, to fortify them by contemplation, and regulate them by reflection, seeing the season of youth and vigour irrecoverably past, its pleasing scenes annihilated, and its brilliant prospects left far behind, without the possibility of return, and feeling, at the same time, the irresistible encroachments of age, with its disagreeable appendages, are surprised and disconcerted by a change scarcely expected, or for which, at least, they had made no preparations. A person in this predicament, finding himself no longer capable of taking, as formerly, a part in the busy walks of life, of enjoying its active pleasures, and sharing its arduous enterprises, becomes peevish and uneasy, troublesome to others, and burdensome to himself. Destitute of the resources of philosophy, and a stranger to the amusing pursuits of literature, he is unacquainted with any agreeable method of filling up the vacuity left in his mind by his necessary recess from the active scenes of life.

All this is the consequence of squandering away the days of youth and vigour without acquiring the habit of thinking. The period of human life, short as it is, is of sufficient length for the acquisition of a considerable stock of useful and agreeable knowledge; and the circumstances of the world afford a superabundance of subjects for contemplation and inquiry. The various phenomena of the moral as well as physical world, the investigation of sciences, and the information communicated by literature, are calculated to attract attention, exercise thought, excite reflection, and replenish the mind with an infinite variety of ideas.

The man of letters, when compared with one that is illiterate, exhibits nearly the same contrast as that which exists between a blind man and one that can see; and if we consider how much literature enlarges the mind, and how much it multiplies, adjusts, rectifies, and arranges the ideas, it may well be reckoned equivalent to an additional sense. It affords pleasures which wealth cannot procure, and which poverty cannot entirely take away. A well-cultivated mind places its possessor beyond the reach of those trifling vexations and disquietudes, which continually harass and perplex those who have no resources within themselves, and, in some measure, elevates him above the smiles and frowns of fortune.—*Bigland.*

THE ASS AND THE MULE.

The following interesting sketch of the nature and history of the ass and the mule, two animals of great value in some countries, though held in little estimation in this, is given by Sir Thomas Dick Lauder, in his notes to his edition of that delightful work, "Gilpin's Forest Scenery."

"It is a remarkable fact that the ass was actually extinct in Britain in the time of Elizabeth. Hollinshed informs us, that in his time 'our lande did yeelde no asses.' We know that they existed before that period, and to our great comfort we have now no reason to complain of any lack of them. It does not appear, however, from what cause the animal became extinct, or how the race was restored. The ass was originally a native of Arabia and Syria, where it is even now found in the wild state, though rarely. Its chief natural habitat is Tartary, where it is the wild native of the dry and mountainous deserts. It is also met with, though less frequently, in Africa. The wild ass stands higher on its limbs than those which are domesticated, and its legs are more slender in proportion. Its hair is very fine, light-coloured, soft, and silky, and on some parts marked by a few obscure waves or undulations. The only exception exists in the native ass of India, which is feeble, small, bow-legged, and apt to be short-winded. Wild asses are gregarious, like horses, but they live in smaller herds, each of which is regularly conducted by a leader, and they owe their safety to their timidity and vigilance, aided by their great acuteness in hearing and smelling. The ass was imported into America by the Spaniards, as well as the horse, and it has now multiplied so much as to be even troublesome from its numbers. In their wild state they have all the fleetness of horses, and neither declivities nor precipices interrupt the fury of their career; and when they are attacked, they have the singular power of defending themselves by means of their heels and mouth with so much address, that they often maim their pursuers without so much as slackening their pace. But after capture, and after having been compelled to bear their first load, their swiftness seems to forsake them, and they contract all that stupidity of look and dulness for which they are proverbial.

The animal seems in general to grow to greater perfection in warm than in cold climates. They are rare in Sweden, and not at all known in Norway. Even in Britain they were long rare even in the south of Scotland; and one of the most striking changes which Edinburgh and its neighbourhood presents to an individual who has been much absent from it for a good many years back, is the great number of small ass-carts now in use, whereas such a thing was never to be seen formerly except as a rarity, and that generally when driven by some gipsy tinker. In the northern parts of Scotland the animal is still rarely met with. In Spain, the breed of asses has been greatly improved by care and attention, so that they often rise to fifteen hands high, and are strong, elegant, and even stately animals. In Egypt and Arabia also, these animals have been brought to so great perfection, that they often fetch a higher price than horses, and they even manifest a degree of noble gracefulness superior to those of Spain. They combine quickness, alacrity, and ease in all their paces, with extreme sureness of foot; and being more hardy than horses, they are preferred to them for long journeys, or for pilgrimages across the Desert.

When young, the ass is uncouthly proportioned, large headed, and altogether of an unprepossessing appearance; but he is gay and frolicsome, until age, harsh treatment, and overwerking, break his spirit, and render him slow, dull, and headstrong. When laden beyond his strength, he expresses his uneasiness by lowering his head, and bending down his ears. If greatly abused, he will open his mouth, and draw back his lips in a disagreeable manner. But with all this, there is no animal more alive to kindness than an ass; and if ass proprietors are disposed to doubt this fact, we should humbly entreat them—tinkers, costermongers, and all, not forgetting those smugglers who work them in their vocation all night, and who let them out all day for carrying the sea-bathing nymphs of the watering-places—to try the truth of what we assert, by putting it to the test of experiment. But little opportunity is allowed the poor ass to show his sense of kind treatment, for where, says he, is kind treatment to be met with? But we know that he is belied in being accused of sulkiness, as well as in being supposed to want intelligence. For as he is remarkable for treasuring up an accurate recollection of localities, so he often displays a strong attachment to his master, whom he recognises even in the greatest crowd; and if he is capable of all this under the detestable usage he experiences from the demons in human form, who seem to take sport and pleasure in his miseries, what effect would not kindness work upon him? We remember an anecdote of an Irishman at Ramsgate, who, being asked to name the hardest wrought creature in existence, replied, 'Och! a Ramsgate donkey to be sure; for, afthur carrying angels all day, he is forced to carry speerits all night.' To which we think that he might have added, that his drivers were little else than devils. But could we only persuade people to try the effect of kindness on the poor ass, he might be so much improved both physically, and morally, as to be a much more useful animal than he even now is. To the poor he is in many circumstances invaluable, from his frugal mode of faring; thistles and plantain leaves, and such road-way-side plants, being all he asks; for, even in his wild state, his favourite food is the wild plants of the desert, and especially those herbs which are bitterly lactescent; and it is likewise worth notice, that he actually prefers brackish water when thus left to his own choice.

It is a strange anomaly in nature, that, whereas it is a well-known fact that horses and asses have a certain degree of constitutional antipathy to each other, so that it is difficult to induce young horses even to pass an ass on the road, they should yet be made to breed together, so as to give rise to the hybrid offspring called mules and hinnies. The former is the produce of a jackass and mare, and is much preferred to the latter, which is the produce of the horse and the she ass. The mule is by much the most robust and hardy, and more fitted for the purposes of riding, draught, and burden. It is a very remarkable fact, that the mule is longer lived than either the horse or the ass, less liable to disease, and more capable of vigorous exertion. In Spain, fifty or sixty guineas is a common price for a good mule, and they are used in carriages of people of the first rank. We have had ourselves occasion to see a pair of beautiful mules driven as leaders in the Defiance Edinburgh and Aberdeen coach. These regularly perform one of the stages to the northward of Perth, which they do twice a-day; and the coach, which is one of the fastest in the kingdom—its time, we believe, being [illegible] miles and

a half or ten miles an hour, stoppages included—loses no ground during the stage in which these animals are employed.

The Literary Gazette relates a curious anecdote, on the testimony of an eye-witness: 'It is customary in Spain to guide the mules without reins, and merely by calling to them. The animal, when called by its name, punctually follows the orders of his driver. But it is a very peculiar circumstance, that they must always be yoked at the very same place which they have been accustomed to, otherwise they will not draw. After the battle of Cordura, several waggons were required to carry away the effects of King Joseph Napoleon from Madrid. While the waggons were loading, most of the drivers unyoked their mules, under pretence of feeding them, and then put them to again at an unaccustomed place. The animals refused to draw. The drivers at first seemed to give themselves all possible trouble to make them go on. The French, who escorted the train, attempted to assist, and dealt out their blows liberally on all sides. The Spanish drivers, however, contrived to get out of the way, and the mules kept their place in spite of all their beating. This occasioned a long delay, for the French sought in vain the cause of the obstinacy of the mules. At last, a part of the escort of cavalry were obliged to dismount, and their horses were harnessed to the waggons. But during this time, a part of the Spanish cavalry, whose approach appears to have been known to the drivers, had made a detour about Madrid, and so they captured all the baggage of poor Joseph, who is said to have narrowly escaped being made prisoner.'

The obstinacy for which the mule is proverbial is much to be attributed to the ill treatment to which, like the ass, the creature is subjected. Our own experience in Alpine travelling has taught us how inestimable the services of this creature are, in traversing those wild regions, on those narrow rock-worn tracks by which alone they are accessible. If the traveller will only give his mule rein enough, and allow him to take his own way, and to pick his own steps, we conceive that he is safer in the saddle than scrambling on his own feet. In the Andes they are no less valuable. Captain Head, in his lively manner, gives us some interesting anecdotes of mules, one of which is as follows:—

'As I was looking up at the region of snow, and as my mule was scrambling along the steep side of the rock, the capataz overtook me, and asked me if I chose to come on, as he was going to look at the "Ladera de las Vaccas," to see if it was passable, before the mules came to it; for when the Cordillera is first opened by the melting of the snow, the Ladera is for some time impassable, till it broadens towards the end of summer. He accordingly trotted on, and in half an hour we arrived at the spot. It is the worst pass in the Cordillera. The mountain above appears almost perpendicular, and in one continued slope down to the rapid torrent which is raging underneath. The surface is covered with loose earth and stones, which have been brought down by the water. The path goes across this slope, and is very bad for about seventy yards, being only a few inches broad: but the point of danger is a spot where the water which comes down from the top of the mountain either washes the path away, or covers it over with loose stones. We rode over it, and it certainly was very narrow and bad. In some places the rock almost touches one's shoulder, while the precipice is immediately under the opposite foot, and high above the head are a number of large loose stones, which appear as if the slightest touch would send them rolling into the torrent beneath, which is foaming and rushing with great violence. However, the danger to the rider is only imaginary, for the mules are so careful, and seem so well aware of their situation, that there is no chance of their making a false step. As soon as we had crossed the pass, which is only seventy yards long, the capataz told me that it was a very bad place for baggage mules, that four hundred had been lost there, and that we should also very probably lose one. He said that he would get down to the water at a place about a hundred yards off, and wait there with his lasso to catch any mule that might fall into the torrent, and he requested me to lead on his mule. However, I was resolved to see the tumble, if there was to be one; so the capataz took away my mule and his own, and then scrambled down on foot, till he at last got to the level of the water, while I stood on a projecting rock, with the two English captains of the mines, the three Cornish miners, the assayer, and the surveyor, who were all anxious to witness the passage of the baggage.

'The drove of mules now came in sight, one following another; a few were carrying no burdens, but the rest were either mounted or heavily laden; and as they wound along the crooked path, the difference of colour in the animals, the different colours and shapes of the baggage they were carrying, with the picturesque dress of the peons, who were vociferating the wild song by which they drive on the mules, and the scene of the dangerous path they had to cross, formed a very interesting scene.

'As soon as the leading mule came to the commencement of the pass, he stopped, evidently unwilling to proceed, and of course all the rest stopped also. He was the finest mule we had, and, on that account, had twice as much to carry as any of the others; his load had never been relieved, and it consisted of four portmanteaus, two of which belonged to me, and which contained not only a very heavy bag of dollars, but also papers which were of such consequence that I could hardly have continued my journey without them. The peons now redoubled their cries, and leaning over the sides of their mules and picking up stones, they threw them at the leading mule, who now commenced his journey over the path. With his nose to the ground, literally smelling his way, he walked gently on, often changing the position of his feet, if he found the ground would not bear, until he came to the bad part of the pass, where he again stopped, and I then certainly began to look with great anxiety at my portmanteaus; but the peons again threw stones at him, and he continued his path, and reached me in safety; several others followed. At last a young mule carrying a portmanteau, with two large sacks of provisions, and many other things, in passing the bad point, struck his load against the rock, which knocked his two hind legs over the precipice, and the loose stones immediately began to roll away from under him: however, his fore legs were still upon the narrow path. He had no room to put his head there; but he placed his nose upon the path on his left, which gave him the appearance of holding on by his mouth. His perilous fate was soon decided by a loose mule who came, and in walking along the Ladera, knocked his comrade's nose off the path, destroyed his balance, and, head over heels, the poor creature instantly commenced a fall which was really quite terrific. With all his baggage firmly lashed to him, he rolled down the steep slope, until he came to the part which was perpendicular, and then he seemed to bound off, and, turning round in the air, fell into the deep torrent on his back, and upon his baggage, and instantly disappeared. I thought, of course, that he was killed, but up he rose, looking wild and scared, and immediately endeavoured to stem the torrent which was foaming about him. It was a noble effort; and for a moment he seemed to succeed, but the eddy suddenly caught the great load which was upon his back, and turned him completely over; down went his head with all the baggage; and as he was carried down the stream, all I saw were his hind quarters, and his long, thin, wet tail lashing the water. As suddenly, however, up his head came again, but he was now weak, and went down the stream, turned round and round by the eddy, until, passing the corner of the rock, I lost sight of him. I saw, however, the peons, with their lassos in their hands, run down the side of the torrent for some little distance; but they soon stopped, and, after looking towards the poor mule for some seconds, their earnest attitude gradually relaxed, and when they walked towards me, I concluded that all was over. I walked up to the peons, and was just going to speak to them, when I saw, at a distance, a solitary mule walking towards us!

'We instantly perceived that he was the Phaeton whose fall we had just witnessed, and, in a few moments, he came up to us to join his comrades. He was, of course, dripping wet; his eye looked dull, and his whole countenance was dejected; however, none of his bones were broken, he was very little cut, and the bulletin of his health was altogether incredible. With that surprising anxiety which the mules all have to join the troop, or rather the leading mule which carries the bell, he continued his course, and actually walked over the pass without compulsion, although certainly with great caution.'"

EFFECTS OF DIFFERENT TEMPERATURES ON THE BODY.

When the air is warm and dry, it excites a most agreeable sensation in the lungs, and in every part of the body; it increases the power or function of every organ, and health is perfect; this is observed in a dry spring, after a cold and moist winter; but when the weather is intensely hot, and persons exposed to the burning sun in the tropics, they often drop dead suddenly from apoplexy; this has happened even in France and Spain, during very hot summers; all the functions, as breathing, digestion, &c. are diminished and oppressed; there is danger of mortification of wounds and ulcers, bowel complaints, fevers, hysteria, epilepsy, &c. Persons labouring under consumption have been advised to live in warm climates, but many physicians suppose that the acceleration of the breathing and pulse, caused by the hot air in summer, only hurry the sufferers to a more speedy death; the change of habitation, from a cold climate to a warm one in winter, is highly advisable, though it is now believed that the southern coasts of this country are as eligible as foreign climes for our consumptive patients. A cold and moist atmosphere produces debilitating effects on man and animals; a cold and dry air is not so injurious; it braces the nerves, and is favourable to health, although it sometimes induces determinations of blood to the head, chest, and abdomen, and causes inflammations in the organs of their cavities.—*Ten Minutes' Advice on Coughs and Colds.*

SALTING AND SMOKING MEAT.

The following method, which requires only forty-eight hours, may be adopted for salting and smoking meat:—A quantity of saltpetre, equal to the common salt that would be required for the meat in the usual way, must be dissolved in water. Into this the meat to be smoked must be put, and kept over a slow fire till all the water is evaporated. It must then be hung up in a thick smoke for twenty-four hours, when it will be found equal in flavour to the best Hamburgh smoked meat, that has been kept several weeks in salt, as red throughout, and equally firm. This method has been resorted to in Germany and other parts, and has been found preferable to any other plan.

OSSIAN.

[The following lines are from a poetical volume lately published under the title of the "Bard of the North, by Dugald Moore." Mr Moore is one of the wonders in the way of authorship, whom we take pleasure in bringing under the notice of our readers. A few years ago he occupied a very humble situation in the warehouse of an extensive publisher at Glasgow. His education and acquaintance with the world were such as might be looked for in an individual so situated. His whole bearing and appearance betokened nothing beyond the line of character and acquirements appropriate to the humble walk of life in which he had chanced to be placed. There was, however, in the mind of this person, a spark of the diviner flame. While still toiling at his lowly tasks, he was secretly employed in conning poetical thoughts, and arranging them in verse. Ultimately, he amassed the materials of a volume, which, being seen and approved of by several persons qualified to judge of its merits, was soon after published. Success followed the attempt, and Mr Moore was induced to bring forward a second. This being also well received, he found himself in possession of sufficient funds to enable him to commence business as a bookseller on his own account. Mr Moore now occupies a comparatively elevated place in society, and, what must be more agreeable to a person so constituted, stands in the first rank of the few who still addict themselves in Scotland to the unfashionable pursuit of poetry. His verses are characterised by a wild strength of imagery and expression; and though a sameness is occasionally observed in the train of his thoughts, his productions are upon the whole such as would do credit to an author who came forward under more favourable circumstances. We earnestly recommend his various volumes to the attention of our readers.]

Thus sang the bard of Cona as he sat
On the grey cliffs of Malmor—"Come, fair moon!
Thou stately daughter of the halls of heaven!
Come through the silent and majestic clouds
Which float from Correyeric down the straths
Of brown Lochaber—fling thy gentle beam
On the great cataract, that from its cave
Leaps like the soul of nature. Beauteous star,
Flash on that tide of power, until it shines
Bright as that pillar which the Hebrew's God
Roll'd o'er the sea of Egypt—when his host
Saw Pharaoh and his army reeling down
Into eternity. Come, holy light!
Bring back departed moments, with the loves
Which made earth paradise. Oh! now I feel
The wave of song rush o'er my feeble heart;
The mighty of the sword again start up—
Fion and Oscar, and the giant bard
Who struck his harp in Selmo—they appear
The awful sons of Tremnore; and the maids,
The fair-hair'd daughters of the silent glens
Who shone like rainbows in the storm, and hush'd
The voice of battle with the song of love,
They rise again; and in my misty dream
The waters which the heroes bounded o'er
Against the sons of Lochlin, lift once more
Their glorious voices; and Treshornish comes
With all the music of their thousand waves.
Oh! let me sit upon the old grey rocks
That from the green moss mournfully look out,
Mocking the sun with silence; and, like death,
Returning life no echo. Let me sit
And hear the murmur of the upland stream,
Which lights the desert with its path of foam;
For ever singing on—it heedeth not
The changes man is making in the world;
Glad in that music which is only heard
In the strange visions, which may cross the brain
Of falcon dreaming in her eyrie up
And high above its tumult."

The present number of the JOURNAL completes the second volume of the work, for which an index and title-page have been prepared, and may be had, together with it, from the publishers or their agents.

LONDON: Published, with Permission of the Proprietors, by ORR & SMITH, Paternoster Row; G. BERGER, Holywell Street, Strand; BANCKS & Co., Manchester; WRIGHTSON & WEBB, Birmingham; WILLMER & SMITH, Liverpool; W. E. SOMERSCALE, Leeds; C. N. WRIGHT, Nottingham; WESTLEY & Co. Bristol; S. SIMMS, Bath; J. JOHNSON, Cambridge; W. GAIN, Exeter; J. PURDON, Hull; G. RIDGE, Sheffield; H. BELLERBY, York; J. TAYLOR, Brighton; and sold by all Booksellers, Newsmen, &c. in town and country.—CHAMBERS'S HISTORICAL NEWSPAPER, a Supplement to the present publication, is published on the first of every month; and CHAMBERS'S INFORMATION FOR THE PEOPLE, of which every number is a distinct subject of human knowledge, appears once every fortnight.
Stereotyped by A. Kirkwood, Edinburgh.

END OF THE SECOND VOLUME.
